(B) Copy of letter from the Secretary of the Navy to Hon. Frederick Hale, chairman subcommittee Senate Naval Affairs Committee, dated April 5, 1920.

by Admiral Sims's letter and the additional evidence introduced, in the following manner:

- (a) Review of first 77 paragraphs of Admiral Sims's letter.
- (b) Discuss some of the points brought up in the additional testimony.
- (c) Sum up the charges set forth in paragraph 78 of the letter and in the additional testimony.

The above gives a viewpoint of the subject at the present date, April, 1920.

It is then considered desirable to present additional testimony in the shape of—

- (d) Letter written in November, 1918, after the armistice, outlining in general terms the naval activities during the war.
- (e) Certain documents on file in the department bearing on the critical six months mentioned in Admiral Sims's testimony.
- (f) Final statement.

As authority for the statements I may make, I desire to inform the committee that from the date of our entry into the war in April until June 25, 1917, I was attached to the office of operations in a subordinate capacity as a member of the plans section and acted in a somewhat advisory capacity with no actual administrative functions. On June 25, 1917, upon the death of my predecessor, Capt. V. O. Chase, United States Navy, I was appointed first aid to the Chief of Naval Operations, Admiral Benson, and some time after was appointed Assistant Chief of Naval Operations by the Secretary, which office I held until January 5, 1919.

I was in general charge of plans, policy, and operations and acted as a sort of general manager under my chief, Admiral Benson. To the best of my knowledge I was in his full confidence and believe that I enjoyed the confidence of the Secretary of the Navy in all matters pertaining to my sphere of activities.

From the date of my appointment to the above offices I assume full responsibility for all advice given pertaining to my office, and for any acts which I may have committed either while Acting Chief of Naval Operations during Admiral Benson's visits abroad or while Assistant Chief of Naval Operations, or aid for operations.

Before commencing upon the routine I would like to speak of the letter, Mr. Chairman, which you sent to the Secretary, dated April 13, 1920, which I received only the other day, April 17, relating to certain correspondence which you wished filed before your committee, and state the action that I have taken. I have here your letter together with the Secretary's reply to it, which I have presented to the Acting Chief of Naval Operations, and asked him to give me everything pertaining thereto. If you find there is something you need more, I can then send it all over to you. This is the first opportunity that I have really had to collect possibly some of the data which you might want.

(The letters referred to are here printed in the record, as follows:)

UNITED STATES SENATE.

April 13, 1920.

HON. JOSEPHUS DANIELS,

Secretary of the Navy, Washington, D. C.

DEAR MR. SECRETARY: On January 9 Senator Page wrote you a letter asking for detailed information concerning all ships of the Navy prior to and on the declaration of war with Germany. In your reply to him of February 4 you stated that you would

this information collected and that you hoped to have it ready by the time the committee should take up its investigation. On March 24 I wrote you a letter asking for this information, and it has not been furnished either to Senator Page or to myself. Will you please see that I have the information at once, as I shall need it for use in the investigation which is now going on? I have received no reply to my letter of March 24, which also asked for official copies of all the letters and cables from Admiral Sims to the department and from the department to Admiral Sims quoted from or given in full in Admiral Sims's testimony before the subcommittee, and a statement in regard to what action, if any, was taken in regard to each such letter or cable. This information also I would like at once for use in the investigation.

Sincerely, yours,

FREDERICK HALE.

Chairman Subcommittee Senate Committee on Naval Affairs.

MY DEAR SENATOR: I have your letter of the 13th in which you refer to letters and cables, requesting official copies of all the letters and cables from Admiral Sims to the department and from the department to Admiral Sims quoted from or given in full in Admiral Sims's testimony, and a statement in regard to what action, if any, was taken in regard to each such letter or cable.

I note that in Admiral Sims's testimony, on page 27, that Admiral Sims states in answer to a question from the chairman:

To give you an idea of the magnitude of the job, I may say that I do not know how many dispatches there were, but they are in the hundreds of thousands. I asked my statistician some time ago how many there were and he said that if they were bound up in boards and set on a shelf, that shelf would have to be 140 feet long in order to contain them. Of course, the committee does not want them all.

Senator TRAMMELL. And your reference will refer to the particular numbers, that they can be found?

Admiral SIMS. Out of those miles of dispatches I am only selecting representative ones, and out of those representative ones I am selecting those that illustrate the point in question; and of all those dispatches, of which there are probably 100,000, I am only selecting a certain number, and those can be included; and if, after my testimony is concluded, you decide that it would be advisable, you can put them in in full; but in the meantime there are only extracts from these dispatches."

All the clerical force of the Navy Department is now only sufficient to care for its regular work, and to comply with your request regarding making official copies of all the letters and cables from Admiral Sims to the department and from the department to Admiral Sims quoted from or given in full in Admiral Sims's testimony will take some time.

However, if you insist, I shall be pleased to have these copies prepared.

As to making a statement in regard to what action, if any, was taken in regard to each such letter or cable, I am unable at this late date to make proper reply. The officers most capable of answering these questions are Admiral Benson, Rear Admiral Kean and Capt. Pratt. These officers will undoubtedly be called before your committee and will be in a position to answer any questions regarding them you may submit.

I shall forward a copy of this correspondence to Admiral Benson, Rear Admiral Kean, and Capt. Pratt.

Very respectfully,

JOSEPHUS DANIELS.

Hon. FREDERICK HALE,
United States Senate, Washington, D. C.

NAVY DEPARTMENT,
Washington, April 16, 1920.

From: Secretary of the Navy.

To: Capt. W. V. Pratt, United States Navy.

Subject: Request of Hon. Frederick Hale, chairman subcommittee Senate Naval Affairs Committee, for certain copies of official documents and certain statements in regard to same.

Enclosures: (A) Copy of letter from Hon. Frederick Hale, chairman subcommittee Senate Naval Affairs Committee, to the Secretary of the Navy, dated April 13, 1920.

(B) Copy of letter from the Secretary of the Navy to Hon. Frederick Hale, chairman subcommittee Senate Naval Affairs Committee, dated April 5, 1920.

1. There are forwarded for your information copies of the above-mentioned correspondence.

JOSEPHUS DANIELS.

Capt. PRATT. I shall read each paragraph of the letter of Admiral Sims upon which I wish to comment and then read the comment that I have to make upon that section. Where I make no comment I note that no comment is necessary. On the first paragraph of Admiral Sims's letter no comment is necessary.

The second paragraph of his letter reads as follows:

2. This is especially true of a naval war of such a peculiar character that the experience of former wars was of little assistance in determining the proper policy and in developing the unusual tactics that were rendered necessary by the number, geographical position, and resources of the countries involved, and by the enemy's method of submarine attack upon merchant shipping in disregard of the tenets of international law and the laws of humanity.

Paragraph 2. This is somewhat misleading. No new principles of broad general policy and strategy are introduced. A novel weapon, the submarine, has been introduced. The introduction of this weapon has rendered necessary certain tactical innovations to combat it. But the broad principles which must govern the general conduct of war remain the same.

Paragraph 3. No comment.

Paragraph 4. No comment.

Paragraph 5 of Admiral Sims's letter read as follows:

5. This is not presented solely from the viewpoint of the commander of our relatively small naval forces in Europe, but specifically as a result of the experience necessarily gained in the unusual and very responsible position of the Navy Department's representative in the naval council of the Allies, where only all allied plans and policies could be continuously discussed, and where only all essential information, both current and general, was at all times available.

The answer to that paragraph, 5, is that our forces in Europe were relatively small in comparison with the forces of the Allies, but toward the close of hostilities they were not small compared with our own forces at home. In this paragraph the major mission has been correctly stated which was that of "Navy Department's representative in Europe." More specifically he was the commander of our forces in European waters, also the direct representative in the war zone of the Chief of Naval Operations. His duties, in order of relative importance, comprise the following:

(a) The direct representative of the Chief of Naval Operations in Europe (with office in London).

(b) Our naval representative in the Allied Naval Council.

(c) Our chief naval executive in Europe who received, referred, transmitted, and carried out such parts of the plans of the Allied Naval Council, as involved our naval forces abroad; which plans and policies has received the approval of our own Government.

(d) The executive abroad in all other matters of United States naval policy and strategy, when that policy and strategy had received the sanction of the home government.

(e) The chief naval executive in all matters pertaining to the broad questions of naval tactics in the war zone, exercising his authority either directly or through his subordinates who were in command of our various naval forces operating in different localities in the war zone.

information is coming to my attention through persons (not connected with either the New York Shipbuilding Co. or the Newport News Shipbuilding & Drydock Co.) to effect that officers of both of these corporations have stated that they would be in position to turn out a large number of the larger cargo vessels for this corporation which the Navy program to which they are committed could be deferred.

In order not to interfere with the Navy program I have been careful to make no mention of any of the large shipbuilding companies, including the foregoing, who are at all committed to naval vessels. Based on this later information and as an answer to the suggestion contained in my letter of May 28, above referred to, I now ask that you consider the possibility of permitting this corporation to avail itself of the facilities for building large cargo vessels that are only available at large shipbuilding plants by permitting two of the larger plants as selected by you to place their facilities at the disposal of this corporation as soon as practicable, so far as naval interests are concerned.

Yours, very truly,

GEO. W. GOETHALS, *General Manager.*

Capt. PRATT (continuing). This minority report I have mentioned and read portions of, because it indicates what we did right in line with building up the destroyer force of the Navy to combat the marine menace, and I know that it was carried out. [Reading:]

DECISION 3-E—IMMEDIATE MISSION.

TITLE OF THE POLICY FOR COOPERATING WITH THE EMERGENCY FLEET CORPORATION ALONG THE LINES SUGGESTED BY GEN. GOETHALS.

JUNE 7, 1917.

2. Capt. W. V. Pratt, United States Navy.

Chief of Naval Operations

Subject: Cooperation of the Navy with the Emergency Fleet Corporation in the matter of propositions submitted by Gen. G. W. Goethals, general manager of the Emergency Fleet Corporation.

Reference: A Letter of May 28, 1917, from United States Shipping Board to the Secretary of the Navy.

The importance and seriousness of this subject, together with the necessity of being first of all at a correct naval policy which shall coordinate its efforts with efforts of those engaged in supplying the tremendous wastage in cargo tonnage met by the submarine campaign, leads me to submit this letter. Were all views exactly in accord there could be no discussion. There is, however, a decided diversity of opinion in the matter of the naval policy to be pursued. This letter is in accord with the general view of the office; but it is submitted as one view of what the policy should be.

Coming to the present emergency, the Navy Department recognizes the building of cargo vessels is a measure of importance commensurate with the building of warships. Since in the department's opinion the building of a wooden fleet is far adequate or a permanent way of meeting the situation, which must be met by steel construction, the Navy Department is glad to cooperate with the Emergency Fleet Corporation in every way possible in enabling it to put its building program into operation.

A statement of the department's policy as regards the order of importance of ships to be laid down is as follows: (1) Submarine chasers, (2) Destroyers,

(3) Scout cruisers, (4) Submarines, large and small, (5) Battleships, (6) Fuel ships, (7) Destroyer tenders, (8) Submarine tenders, (9) Hospital ships, (10) Ammunition ships, (11) Repair ships, (12) Transports, (13) Gunboats, (14) Battle ships.

The first five types, with the exception of (3), scout cruisers of which only a limited number to serve as destroyer flotilla leaders should be laid down, are types of ships which are needed at present, and the naval needs are such that all vessels of these types authorized should be begun at once.

Of equal importance to the above ships come the heavy merchant cargo carriers contemplated by the Emergency Fleet Corporation.

Naval ships coming under heads (6) to (12), inclusive, could if necessity arise be supplied out of the very types of ships to be built by the Emergency Fleet Corporation.

Admiral Grant, Royal Navy, acted as the liaison officer between the Admiralty in London, and the Office of Operations, Washington, and as his office was established here, he was in daily consultation with our office.

Paragraph 6. On this I make no comment.

Paragraph 7 of Admiral Sims's letter is as follows:

7. Brief orders were delivered to me verbally in Washington. No formal instructions or statement of the Navy Department's plans or policy were received at that time, though I received the following explicit admonition: "Don't let the British pull the wool over your eyes. It is none of our business pulling their chestnuts out of the fire. We would as soon fight the British as the Germans."

In reply to that, I would say: I have no first-hand knowledge as to what person made this remark. I have this comment to make. In April, 1917, Admiral Sims, an officer with friendly sentiments toward the British, was sent to England. On June 25, 1917, Capt. Pratt, who had formerly been Chief of Staff for Admiral Sims for over two years, and himself holding friendly sentiments toward the British and French, was made Admiral Benson's aide for operations. Shortly after he was appointed Assistant Chief of Naval Operations. On February 2, 1918, Admiral Mayo's estimate that he should proceed to European waters and take command there was not approved by the department. On April 12, 1918, a similar decision of Admiral Mayo was not approved by the department. On August 10, 1918, another estimate and similar decision of Admiral Mayo was again not approved by the department. These estimates of Admiral Mayo's were sound from the viewpoint of our fleet, but Admiral Benson's entire desire was to cooperate along the lines of and in accordance with plans laid down by the Allies and not to disrupt the present arrangement which might have taken place, as Admiral Mayo was senior to Admiral Sims. This seems to indicate a desire to cooperate with our allies even at the expense of our own naval pride, and to support Admiral Sims.

Paragraph 8. No comment, except that his assumed mission was in harmony with the department's intention.

The ninth paragraph of Admiral Sims's letter is as follows:

9. I arrived in Liverpool on April 9, and in London on April 10, 1917, and went immediately to the admiralty, where the naval situation was fully explained by the responsible officials. This explanation showed that the Navy Department did not understand the seriousness of the submarine situation; that its information was very incomplete and inaccurate. This was due to the insufficient scope of its intelligence service, very few naval officers having been sent to Europe for information before we entered the war.

In regard to paragraph 9, quite correct. This information was later partially given by the various allied missions sent to Washington. For the greater part, however, this information was given to us by the splendid service built up in Europe largely through the efforts of Admiral Sims, with the cooperation of the Office of Naval Intelligence in Washington, which is a division of the Office of Operations. In my opinion our intelligence service in Europe should have been expanded earlier, whether we contemplated entering the war or not.

Paragraph 10 of Admiral Sims's letter is as follows:

10. A review of the cables sent to the department in April, 1917, shows that the situation was very serious, and that the enemy was rapidly winning the war by the destruction of merchant shipping. Throughout the following year numerous cables and letters of the most urgent possible character were sent with the object of impressing

It must have been noted that upon our entry into this war a certain tension between this country and Japan was immediately relaxed. They immediately, in certain press articles, suggested a close cooperation with the United States. Close cooperation now with Japan is, to my mind, the key to the solution of what we have been a future problem.

Therefore if we concentrate our present naval building efforts to—

1. A standard type of destroyer to meet present needs.

2. Submarines, large and small, to meet future needs.

3. Battleships laid down and now on the ways.

4. Certain types of small craft, such as tugs and sweepers.

5. Coöperate with the Shipping Board to produce cargo carriers, we will have put the Navy's best efforts not for the Navy alone, but for the country, and especially the Allies, whose war is now our own.

6. For the above reasons I am obliged to differ with the consensus of opinion issued in the Office of Operations and implied in the General Board's recommendation, and do concur in the opinion and propositions expressed in Gen. Goethals's report of May 28, 1917, with the modification set forth in paragraphs 8, 9, and 10.

W. V. PRATT.

The CHAIRMAN. That was signed by you?

Capt. PRATT. I signed it. At the time, in view of the letter writing I was appointed as head of the board by the Secretary of the Navy. We did not submit our plans finally until July 6. It took me time to mature it and get it out; that is, how we would best seek to operate against the submarine. This was called the Board of Devices and Plans. That is, it was a board of devices and plans connected with submarine warfare.

The CHAIRMAN. The members were appointed by the President?

Capt. PRATT. It was a board appointed some time in May or June to confer with the British and French scientists that came over here, and in doing so we went beyond our instructions a bit, and took into consideration everything which could be done in every way, not only in connection with sound devices, which was the principal motive of this mission, but we went further, having already introduced that matter, and put forth a plan which the Secretary signed immediately, adopting a very extensive plan, of the switching of the entire battle-ship program to a destroyer program.

That report is as follows:

REPORT OF BOARD ON DEVICES AND PLANS CONNECTED WITH SUBMARINE WARFARE
TO SECRETARY OF THE NAVY.

DEPARTMENT OF THE NAVY,
Washington, July 6, 1917.

1. Board on devices and plans connected with submarine warfare.

2. Secretary of the Navy.

Subject. Summary of conclusions of the board, with recommendations.

1. The board designated by your orders to consider devices and plans connected with submarine warfare has carefully considered many suggestions for dealing with the submarine situation, and submits a preliminary report of its conclusions, with recommendations.

2. The board has given careful study to the discussions of the English and French scientific commissions to this country; has considered the progress made in the United States on the study of the submarine situation; has considered various reports from commanding officers of armed guards; reports from Vice Admiral Sims, and Naval Intelligence reports.

3. The board now considers it a duty to bring to your attention the urgent need of immediately securing an adequate supply of material required for an aggressive submarine campaign, and the formulation of plans to impress into service at the earliest possible moment all available United States vessels that will be of use in offensive operations against enemy submarines.

7. It, therefore, becomes evident that any cooperation of the Navy with the Emergency Fleet Corporation must be along lines represented by classes (3) and (14).

8. It is therefore believed that the first proposition submitted by Gen. Goethals is sound and that the Navy Department should cooperate to this extent. No new ships for the Navy of classes (6) to (12), inclusive, will be laid down on ways outside of navy yard ways without an adjustment first with the Emergency Fleet Corporation, so long as the present emergency exists. If, however, due to this policy the shortages in such types of naval auxiliaries severely handicap the Navy, it is agreed that the Emergency Fleet Corporation will meet this need out of its own vessels building.

9. It is also believed that the second proposition is sound and that the Navy Department should cooperate to the extent of relieving any or all of the four building ways (not in a navy yard on the Atlantic coast) now under construction for the battle cruisers, in order that said ways may be used by the Emergency Fleet Corporation. This arrangement to hold good during the present emergency, or unless a new military necessity demands a new arrangement.

10. It is not the department's policy to allow cargo carrying merchant ships to be laid down on any ways in the existing navy yards. Such construction cramps the yard facilities and handicaps the purpose for which these yards were originally established, viz, the repairs of naval vessels already in service. But in view of the present emergency it is believed that any battle cruisers' ways laid down in a navy yard on the Pacific coast could be temporarily loaned to the Emergency Fleet Corporation.

11. The above views are held because it is believed:

(a) A successful termination of this war will preclude the chance of another for some term of years.

(b) For the allied purposes, merchant ships are as essential to the successful termination of this war as battleships, and that their construction is even more important at present.

(c) The counter for the United States, in case of an unsuccessful termination of this war, lies in: (1) In our naval submarine. (2) In conscription.

(d) Of new future possible opponents other than the present opponents—(1) The chances are remote, owing to present alliances. (2) We are already stronger than any other probable opponents. (3) It would be better to buy our battle cruisers or battleships from our present allies (in case they were needed) than to lay them down now in the present emergency, an emergency which must be met now.

(e) In case this war terminates successfully, the merchant ships laid down by us will be the most useful types in existence in furthering the ultimate good of the country.

12. Finally, we did not enter this war alone. We have allies, and their efforts against the now common enemy have stood between us and possible aggressions for over two years. They have needs. Their needs are immediate and imperative. Their cause is our cause now. The decision to the estimate of the situation as made in this office was as follows:

"IMMEDIATE MISSION.

"To render the maximum possible support now to the enemies of the Central Powers."

And a second important but future mission was:

"Develop the full military and naval strength of the United States as far as possible."

In a paper of April 5, 1917, the General Board, writing on the subject "Assistance that United States can give allies upon declaration of war," makes several pertinent suggestions, of which one is as follows: "Keep constantly in view the possibility of the United States being in the not distant future compelled to conduct a war single-handed against some of the present belligerents and steadily increase the strength of the fighting line," etc. That remark is pertinent and sound, but it does not mean that one fraction of the strength of the effort we should put into the successful accomplishment of the immediate mission should be sacrificed to any possible future contingency. Moreover, the day that the conscription law passed and universal training was assured to the peoples of our country its future security was guaranteed in a manner past every future building program the Navy might attempt.

13. A hasty review of the international situation leads me to the conclusions that England's fleet will never be allowed to pass into German hands, nor can it be quiescent while Germany works her will on any of the present allies. It is the death of England to allow it. If at the end of this war strained relations should arise with England (a proposition which seems to me untenable), no amount of feverish building of dreadnoughts or battle cruisers could hope to put us in a position to cope with her on the high seas. In such a contingency our efforts should now be directed toward building our submarine fleet in both the offensive and information types.

14. It must have been noted that upon our entry into this war a certain tension existing between this country and Japan was immediately relaxed. They immediately, in certain press articles, suggested a close cooperation with the United States. This close cooperation now with Japan is, to my mind, the key to the solution of what might have been a future problem.

15. Therefore if we concentrate our present naval building efforts to—

(1) A standard type of destroyer to meet present needs.

(2) Submarines, large and small, to meet future needs.

(3) Battleships laid down and now on the ways.

(4) Certain types of small craft, such as tugs and sweepers.

(5) Cooperate with the Shipping Board to produce cargo carriers, we will have put forth the Navy's best efforts not for the Navy alone, but for the country, and especially for the Allies, whose war is now our own.

16. For the above reasons I am obliged to differ with the consensus of opinion expressed in the Office of Operations and implied in the General Board's recommendations, and do concur in the opinion and propositions expressed in Gen. Goethals's letter of May 28, 1917, with the modification set forth in paragraphs 8, 9, and 10.

W. V. PRATT.

The CHAIRMAN. That was signed by you?

Capt. PRATT. I signed it. At the time, in view of the letter written, I was appointed as head of the board by the Secretary of the Navy. We did not submit our plans finally until July 6. It took some time to mature it and get it out; that is, how we would best work to operate against the submarine. This was called the Board on Devices and Plans. That is, it was a board of devices and plans connected with submarine warfare.

The CHAIRMAN. The members were appointed by the President?

Capt. PRATT. It was a board appointed some time in May or June to confer with the British and French scientists that came over here, and in doing so we went beyond our instructions a bit, and took into consideration everything which could be done in every way, not only in connection with sound devices, which was the principal motive of this mission, but we went further, having already introduced that letter, and put forth a plan which the Secretary signed immediately, adopting a very extensive plan, of the switching of the entire battleship program to a destroyer program.

That report is as follows:

REPORT OF BOARD ON DEVICES AND PLANS CONNECTED WITH SUBMARINE WARFARE
TO SECRETARY OF THE NAVY.

DEPARTMENT OF THE NAVY,
Washington, July 6, 1917.

From: Board on devices and plans connected with submarine warfare.

To: Secretary of the Navy.

Subject: Summary of conclusions of the board, with recommendations.

1. The board designated by your orders to consider devices and plans connected with submarine warfare has carefully considered many suggestions for dealing with the submarine situation, and submits a preliminary report of its conclusions, with recommendations.

2. The board has given careful study to the discussions of the English and French scientific commissions to this country; has considered the progress made in the United States on the study of the submarine situation; has considered various reports from commanding officers of armed guards; reports from Vice Admiral Sims, and Naval Intelligence reports.

3. The board now considers it a duty to bring to your attention the urgent need of immediately securing an adequate supply of material required for an aggressive submarine campaign, and the formulation of plans to impress into service at the earliest possible moment all available United States vessels that will be of use in offensive operations against enemy submarines.

MERCHANT SHIP PROTECTION.

4. Torpedo nets and similar protecting devices of many forms have been considered, and rejected, as being impracticable. They all have the serious fault of greatly reducing the ships' speed; are very cumbersome and difficult to handle; and above all are of very doubtful usefulness in preventing damage to the ship carrying them.

5. Plans for reducing visibility have been considered; including methods of ship's painting; smoke elimination by use of oil engines; and smoke elimination by use of special fuels. The board is of the opinion that every practicable means of reducing visibility should be employed.

6. High speed and zigzag steering are considered to be very simple and effective means of preventing successful submarine attack. In clear weather all vessels in the danger zone should be required to steam at highest speed and on zigzag courses.

7. The armament of merchant ships has been considered. There are two considerations to be met. First, engagement at long range, for which guns of 3-inch caliber and above are required. Second, engagement at very close range, for which small caliber guns capable of large angle of depression are required. One-pounder guns mounted on the ends of bridges are considered by the board to be satisfactory for this latter purpose. Howitzers of the most efficient type should be supplied as soon as possible. Their use at ranges below 2,000 yards is of the utmost necessity.

8. Armed guards and lookouts must be made as efficient and effective as possible. This board is of the opinion that the present methods of supplying armed guards, their training, etc., are in general satisfactory. In connection with the training of the armed guards it is strongly urged that merchant ship captains and other officers be required to attend a naval school of instruction and be taught all methods of avoiding submarine attack. The board is also of the opinion that lookouts must be very carefully selected and trained.

9. Depth charges for merchant vessels present a debatable question. If launched over the side they would be a source of danger to own vessel, unless launched from a point near the stern when the vessel was making at least 10 knots. The board is of the opinion that even a remote chance of using a depth charge successfully in this manner warrants the issue of a small number of those charges to those merchant vessels whose armed guard is under the command of a commissioned officer. The projection of depth charges by means of a howitzer or bomb-throwing device is considered by the board to be a very important matter. Some simple equipment of this kind should be supplied merchant vessels without delay.

10. Smoke boxes of two types have been considered, both of which have sufficient merit to warrant their use. The first type is for use on board own vessel; the second type for use by throwing overboard. A smoke-producing torpedo has been proposed. The board is of the opinion that this plan is impracticable. A smoke-producing bomb, to be thrown by the depth-charge howitzer or the bomb-throwing device, has also been considered. The board is of the opinion that this idea should be developed and the plan put into operation.

11. Several special methods of ship construction and loading of cargoes to render vessels unsinkable have been considered. The board is of the opinion that while this general subject is of great interest and that the plans should be encouraged, they are not preventive methods with which this board is principally concerned.

12. If a simple and efficient sound detection device can be perfected which can be used at speeds up to 12 knots, the board is of the opinion that all merchant ships should be required to carry these devices as a means of evading submarines.

FIXED BARRIERS.

13. Fixed barriers, consisting of several types of nets, anchored mines, and the combination of nets and mines, have all been considered. The board is of the opinion that these devices should be used to completely protect the important harbors of our own coast; and that there may be use for such obstructions abroad. The board is of the opinion that the United States Navy should immediately collect ready for use, a very large quantity of this material, especially offensive mines.

FLOATING BARRIERS OR TRAPS.

14. Floating obstructions consisting of nets, mines, or a combination of nets and mines have been considered, and the board is of the opinion that while there are many objections to the use of these devices when uncontrolled, there is a real use for mine-

and mine-loaded sweeps, either by a single vessel or by a pair of vessels. There are objections to this last plan, but it has some merit, and a limited supply of such material should be made available, at least enough to insure a thorough trial.

UNDERWATER SOUND DETECTORS AND DIRECTION INDICATORS.

Several devices and plans for underwater sound detection and direction finding have been considered; not in detail, but their general characteristics considered with reference to their practical use, and the board is of the opinion that two general classes of devices are required for immediate use: 1st, a simple microphone or magnetophone adapted so as to be a direction indicator, suitable for use on all small patrol vessels, and a more elaborate detector of audible or subaudible sound waves which can be used on destroyers, yachts, merchant vessels, etc., and be used effectively when a vessel is under way at high speed. The board is informed that encouraging progress is being made to develop both classes of devices, and is of the opinion that plans should now be made for their supply and issue, and that immediate steps should be taken to instruct and train the personnel required to operate these devices.

MAGNETIC DETECTORS.

Magnetic detectors have been considered. The board is of the opinion that there is little hope for success in developing a magnetic detecting device that can be used successfully on board a rolling and pitching vessel. At best such a device would be of very limited use. Experimental work along these lines should be conducted so as not to interfere with more important experiments and tests. The principal reason for carrying on experimental work along this line is the hope that it may lead to the development of some useful device.

SOUND ECHO METHODS.

Sound echo methods are being investigated by the engineers of the General Electric Co. and the Western Electric Co. It is hoped that this method can be developed for use in detecting mine cases and submarines when resting on the bottom or so resting that sound devices can not be employed. It is believed that this method requires considerable time for its development and that when developed, the apparatus used will not be simple in construction and operation.

UNDER-WATER VISION.

No means of securing under-water vision have been proposed, although the idea has been suggested. The board can make no comment on this subject; except that although a successful means is found, its useful application must necessarily be so restricted as to make it of very little value.

AIRCRAFT.

Many suggestions have been made for the employment of aircraft alone and, in conjunction with patrol vessels, for the detection and destruction of submarines. The board is of the opinion that with the development of our coastal air stations there should be undertaken as quickly as possible tests and experiments to fully determine the fitness of all types of aircraft for this purpose.

Aircraft are used abroad in large numbers in antisubmarine warfare. The board is of the opinion that this branch of the United States Naval Service should be very promptly expanded to be prepared for such operations. As aircraft will undoubtedly be of very great value, especially as the war progresses, the board is of the opinion that large numbers of the most suitable types be contracted for immediately, so that they will be available when a definite plan has been worked out for their employment. Otherwise delay in securing the aircraft will prevent the prompt execution of the plan.

VESSELS FOR CHASE AND DESTRUCTION OF SUBMARINES.

The board has considered the question of the best type of vessels to be used in tracking down and destroying submarines, and is of the opinion that the one best type is the destroyer, fitted with sound detecting devices capable of use while the destroyer is under way and of determining direction. The reasons for this opinion

are that only this type has the necessary characteristics of speed, seaworthiness, habitability, reliability, and endurance. The submarines must be hunted, trailed, and destroyed. For this task the destroyer is the best type of vessel known. The board is of the opinion that every effort should be made to put into service as many destroyers as possible, and that a large number of new antisubmarine destroyers of a practical type should be built in the least possible time.

22. The board deems it advisable to submit its recommendations in such form that if approved they may be readily issued as instructions to those responsible for carrying them into effect.

RECOMMENDATIONS.

Bureaus of Ordnance, Steam Engineering, and Construction and Repair.—(a) Board recommends that the bureaus put in operation every possible means of expediting the completion of destroyers now building; authorize approval of plans by bureaus' local inspectors; authorize any satisfactory changes under the contract that will expedite work; encourage contractors to utilize the services of subcontractors in getting out material; and regardless of additional expense, secure the completion of destroyers now building at the earliest possible moment, submitting to the Secretary for approval any plan or plans to accomplish this end.

(b) Board recommends that the bureaus confer in getting out plans for a new type antisubmarine destroyer which will meet the military requirements specified by the department; and which may be constructed quickly on one standard design which will enable all auxiliary machinery and equipment to be procured in lots of identical units and thus secure the benefits of quantity production. The board further recommends that the plans provide for the immediate construction of 200 destroyers of the new type, and that the bureaus submit data necessary for the department to prepare draft of legislation required to secure these new destroyers as quickly as possible.

Naval Operations.—(a) Board recommends that plans be immediately prepared to fit out and equip all available vessels that can be spared for service abroad to be used in the antisubmarine campaign.

(b) Board recommends that plans be immediately prepared to secure a large number of the most suitable types of aircraft; to train the naval aviators in antisubmarine operations; and to perfect the plans for the use of all types of aircraft in the detection and destruction of submarines.

Bureau of Steam Engineering.—(a) Board recommends that the bureau procure 500 simple underwater microphone or magnetophone sound and direction indicators for issue to patrol vessels; these to be put in service as soon as possible in order to train personnel. The board further recommends that when a satisfactory device is available all patrol vessels in service be supplied with the listening devices.

(b) Board recommends that the bureau immediately arrange for the manufacture of a large number of underwater sound-detecting and direction-finding devices of the Fessenden type in order that United States' and allies' destroyers and other vessels engaged in hunting submarines may be equipped as quickly as possible; also that merchant vessels may be so equipped in order to avoid enemy submarines.

Bureau of Ordnance.—(a) Board recommends that the bureau be authorized to immediately arrange for the manufacture of a large supply of mines, nets, aeroplane torpedoes, aeroplane guns, aeroplane bombs, howitzers, depth charges, smoke boxes, smoke bombs, blunt-nose explosive shell, and other ordnance material which is now required and which will be required in the near future, to enable the allied navies to prosecute a successful aggressive campaign against the enemy submarines. Board recommends that the bureau immediately submit estimates of funds required to carry out the above recommendations.

On July 6 that was submitted, and on July 6 the Secretary signed the following letter, which I will submit. That letter went in with the plan. The letter is as follows [reading]:

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, July 6, 1917.

From: Secretary of the Navy.

To: Chief of Naval Operations, Bureau of Ordnance, Bureau of Steam Engineering, and Bureau of Construction and Repair.

Subject: Report on submarine warfare.

Inclosure: (a) Report of board on devices and plans connected with submarine warfare.

1. The department forwards herewith copy of report of board on devices and plans connected with submarine warfare.

2. The department has approved this report and recommendations.

3. Please take immediate steps to carry out the board's recommendations.

JOSEPHUS DANIELS.

NOTE.—This report was sent by the Chief of Naval Operations to Bureaus of Navigation, Medicine and Surgery, Supplies and Accounts, and Yards and Docks on July 9, 1917, directing them to take such action as necessary to carry out board's recommendation.

NAVY DEPARTMENT,
Washington, D. C., July 14, 1917.

From: The board on devices and plans connected with submarine warfare.

To: The Chief of Naval Operations.

Subject: Its recommendations of efforts which should be made in the endeavor to put an end to the submarine menace. Particular reference to the recommendation for the construction of 200 antisubmarine destroyers.

PRELIMINARY.

1. This letter is forwarded to the Chief of Naval Operations in response to his verbal instructions of July 14, directing them to make a statement expounding their reasons for the recommendation of 200 anti-submarine destroyers.

2. *Quotation from board's report, page 9:* "Vessels for chase and destruction of submarines."

21. The board has considered the question of the best type of vessels to be used in hunting down and destroying submarines, and is of the opinion that the one best type of vessel is the destroyer, fitted with sound detecting devices capable of use while the destroyer is underway and of determining direction. The reasons for this opinion are that only this type has the necessary characteristics of speed, seaworthiness, habitability, reliability, and endurance. The submarines must be hunted, trailed, and destroyed. For this task the destroyer is the best type of vessel known. The board is of the opinion that every effort should be made to put into service as many destroyers as possible, and that a large number of new antisubmarine destroyers of a practical type should be built in the least possible time.

22. The board deems it advisable to submit its recommendations in such form that if approved they may be readily issued as instructions to those responsible for carrying them into effect.

3. *Quotation from board's recommendation re the destroyers now building and the type suggested for new construction:* "Recommendations—Bureaus of Ordnance, Steam Engineering, and Construction and Repair."

(a) Board recommends that the bureaus put in operation every possible means of expediting the completion of destroyers now building: authorize approval of plans by bureaus' local inspectors; authorize any satisfactory changes under the contract that will expedite work; encourage contractors to utilize the service of subcontractors in getting out material; and regardless of additional expense, secure the completion of destroyers now building at the earliest possible moment; submitting to the Secretary for approval any plan or plans to accomplish this end.

(b) Board recommends that the bureaus confer in getting out plans for a new type antisubmarine destroyer which will meet the military requirements specified by the department and which may be constructed quickly on one standard design which will enable all auxiliary machinery and equipment to be procured in lots of identical units and thus secure the benefits of quantity production. The board further recom-

mends that the plans provide for the immediate construction of 200 destroyers of the new type and that the bureaus submit data necessary for the department to prepare draft of legislation required to secure these new destroyers as quickly as possible.

4. *Reasons for recommendations:*

In making the above recommendations the board was actuated by the following reasons:

(a) *The seriousness of the present situation.*—Every report from abroad indicates that the present submarine situation is extremely serious. This is a matter of fact.

(b) The statements from abroad that vessels of the destroyer type or those approximating the destroyer type are the best antisubmarine craft afloat.

(c) The reiterated statements both from our own officers operating abroad and from foreign officers that one of the most important factors is time, necessitating speed in building and speed in placing those ships which can successfully operate against the submarines in the war zone.

(d) The information received from abroad that while the 110-foot chasers will be used against the submarine, as will also any type of craft which can keep the sea and is not too valuable, still it is not an unqualified success. It is more of a makeshift than it is a desirable sea-keeping antisubmarine craft.

(e) The belief that a standardized type could be developed which while not displacing present destroyers building efforts would in the near future outspeed the present destroyer policy.

(f) That what was needed now was speed in construction and standardization, not improvement (with an eye to the future), and that to get what is now needed certain concessions in the present evolved type of destroyer principally in the direction of speed would have to be made to secure a more rugged type of craft.

(g) The knowledge that England has been forced to develop a type especially for antisubmarine work.

(h) The belief that drastic and perhaps novel methods would have to replace conservative estimate if we were to grasp the present situation in time.

(i) The conviction that the antisubmarine destroyers asked for differed practically so little from the development of the best of the 750-ton type that it would be extremely useful not only now but in the future.

(j) The conviction that the present established naval building policy would have to be modified; that a new policy would have to be decided upon and established, and that no policy could succeed unless the will to drive it through at all cost were there.

5. *The board's conception of the naval building program which should be adopted:*

Before arriving at a decision 200 of the antisubmarine destroyers, the board had to formulate its conception of what an adequate building policy should be now, in order to do its best to meet present conditions while still attempting to safeguard the future.

(a) As a basis of original estimate, the Department's policy in regard to the order of importance of warships to be laid down was taken under consideration. The order of importance as laid down is as follows:

- (1) Submarine chasers.
- (2) Destroyers.
- (3) Scout cruisers.
- (4) Submarines, large and small.
- (5) Battleships.
- (6) Fuel ships.
- (7) Destroyer tenders.
- (8) Submarine tenders.
- (9) Hospital ships.
- (10) Ammunition ships.
- (11) Repair ships.
- (12) Transports.
- (13) Gunboats.
- (14) Battle cruisers.

(b) Owing to the present emergency, the board recognized the building of cargo vessels as a measure of importance commensurate with the building of warships itself.

(c) In order to meet both naval needs and merchant ship needs, it was necessary to effect the closest cooperation between the two representative interests. A definite naval building policy must be established that there might be no conflict between the two paramount interests.

(d) It was believed that certain concessions in the present naval building program would have to be made to the merchant ship building interests, as represented by the Emergency Fleet Corporation. That these concessions would be most useful and

cal in view of the present submarine situation) if made along the lines of the naval ships. And that such concessions, in so far as they are matters of practical building, should be made. That so far as the present big naval tonnage is concerned it was more a question of clearing the ways and releasing the men and materials, rather than a question of how many of the big types we should lay down.

The views stated in (d) were held because it was believed that—

- Successful termination of this war will preclude the chance of another for some terms of years.
- For the allied purposes, merchant ships are as essential to the successful termination of this war as battleships, and that their construction is even more important at present.
- The counter for the United States, in case of an unsuccessful termination of this war lies: (1) in our naval submarine; (2) in conscription.
- Of new future possible opponents other than the present opponents: (1) The chances are remote, owing to present alliances; (2) we are already stronger than any other probable opponents; (3) it would be better to buy our battle cruisers or battleships from our present allies (in case they are needed) than to lay them down now in the present emergency, an emergency which must be met now.
- In case this war terminates successfully, the merchant ships laid down by us will be the most useful types in existence in furthering the ultimate good of the country.
- Finally, we did not enter this war alone. We have allies, and their efforts against the now common enemy have stood between us and possible aggressions for over two years. They have needs. Their needs are immediate and imperative. Their cause is our cause now.

Therefore, the board believed that we should concentrate our fresh building on

- A standard type of destroyer to meet present needs.
- Submarines, large and small, to meet future needs.
- Battleships laid down and now on the ways.
- Certain types of small craft, such as tugs and sweepers.
- Cooperate with Shipping Board to produce cargo carriers.

Thus to be done, we will have put forth the Navy's best efforts, not for the Navy but for the country, and especially for the Allies, whose war is now our own.

Following the above line of reasoning, the board made as its first recommendation the construction of 200 submarine destroyers. The general specifications which had been laid down for the type were practically a modernized type of the old 750-ton destroyer made more seaworthy and more enduring, but with less speed. The final word went in after cabled advice from abroad, Vice Admiral Sims, seemed to favor this same general type.

No recommendations could be made as to submarines, for this type has never been standardized to the extent that the destroyer type has. Moreover, general policy as to their future use is still not entirely settled, though the German experts in this particular type, have clearly indicated their policy. The prime requisite to put through such a policy as indicated above:

The first step to be taken to put any such policy through would be for the naval representatives, the merchant ship representatives, and the builders to get together and definitely decide upon the ways and means to do it.

The above may not be the true solution of our building problem. It is, however, a definite statement of a policy and the reasons that influenced that choice.

NAVY DEPARTMENT,
Washington.

Memorandum for the Chief of Operations.

Subject: (a) General Board's recommendations in re destroyers building program.

(b) Submarine Device Board's recommendation for 200 submarine destroyers.

1. Referring to General Board's conclusions that certain shipyards now engaged in building destroyers, battleships, merchant ships, etc., could furnish the Government better returns by becoming utilized to the limit of their capacity in the building of the present type of destroyer which may be called a "fleet" destroyer 35 knots speed, etc., in so far as the shipyards mentioned and concerned under the present conditions in those yards, I agree with the General Board's recommendation and recommend that these yards be assigned 50 or 60 "fleet" destroyers according to the present approved plans to which they are building and that every facility and encouragement be given to these yards to complete a minimum of 50 or 60 of these destroyers prior to January 1, 1919.

2. Referring to recommendation contained in (b) of 200 submarine destroyers. I also entirely agree with the program. These last vessels are to be of the type standardized by the board and to be built by other yards than those building under program in paragraph 1. They should be built under the "assembly" plan along the line used by Gen. Goethals in building the ship commission's vessels—that is, a distribution of the various parts to yards and works adapted to the building of each part and then the complete destroyer be assembled at a certain yard assigned as assembly yard, these 200 to be absolutely standardized in every respect and particular, to have only one type of engine, to have only one type of boilers, to have only one type of auxiliaries, to be built absolutely according to one set of standardized plans, so that any parts will assemble at any yard into a completed vessel. This will undoubtedly require the expansion of a number of works, such as pump builders, boiler builders, etc., and it will also require that pump builders, boiler builders, etc., now engaged in the building of their own special type, be converted into factories for the building of the standardized type. In short, it will require the Government to direct the builders, so that we will obtain what we want instead of the previous method of taking what each separate designer or builder thought we needed or knew that he could best produce. This may also require the advance of certain per cent of prices where expansion is necessary. That can be arranged and I believe that the present laws will permit any other control of these factories or workshops that may be necessary to attain our purpose.

3. As a result of the above programs (outlined in paragraphs 1 and 2), I believe it possible for the fleet to be increased by 50 standardized destroyers and 150 to 200 submarine destroyers, all to be in commission by or before January 1, 1919, and the deliveries of which should commence in large number by February 1, 1918.

J. S. McKEAN.

NAVY DEPARTMENT,
Washington, July 19, 1917.

Memorandum for Capt. Pratt.

As stated in my previous memorandum on general board's recommendation, I am in full agreement with the joint letter, paragraphs 6, 7, and 8, in so far as relates to the following plants and to them only: Newport News Shipbuilding & Dry Dock Co., New York Shipbuilding Co., Wm. Cramp & Sons, Fore River Shipbuilding Corporation, Union Iron Works. I believe that these firms can furnish in addition to those already under contract, 50 more destroyers of the fleet type, with certain simplifications such as elimination of reduction gear, etc.

As to the other part of the program, the standardized submarine destroyer, this should be undertaken with works other than those referred to in paragraph 1, and it should be done and could only be done satisfactorily along the line suggested in paragraph 5. I believe that this assembly plan (subletting contracts for different parts to different firms and assembling at certain other yards) would produce from 150 to 200 submarine destroyers by January 1, 1919.

The above programs would call for the construction of both 1 and 2 being given precedence over battleships and to a certain extent over merchant ships building by the Shipping Board. Materials, workmen, and machines should be furnished for this job first. This is logical in view of the fact that the Shipping Board program is in its ultimate results a process of feeding submarines to death. This program contemplates poisoning them.

McKEAN.

NAVY DEPARTMENT.
Washington, July 19, 1917.

Memorandum.

1 The General Board, Vice Admiral Sims, and all officers agree that we should make our maximum effort in building destroyers for antisubmarine warfare.

2. Sixty-six destroyers are now under construction. The contractors for these destroyers can take in hand 50 additional destroyers for delivery previous to January, 1919. The General Board and I are in agreement that contracts for these destroyers should be placed immediately.

3. Operations has recommended that additional standardized destroyers to the number of 200 be authorized. It does not desire a new type of vessel, but a vessel of proven character similar to the 750-ton destroyer of the Beale, Jouett, Jenkins type. The idea being to produce these destroyers on the assembly plan. The technical bureaus report that it is mechanically possible to produce a total of 200 additional destroyers by the exclusive employment of the five largest yards in the country by January, 1919. They state that this would require the merging of those yards under a single management.

4. Operations recommends for special construction destroyers of less speed and greater reliability and simplicity than those now building—a vessel of less than a thousand tons. It recommends an armament of 4-inch-fifty guns because these guns are more quickly obtainable and are an adequate reply to any guns known to be carried by enemy submarines. The General Board recommends substantially the same character of vessel, but armed with 5-inch guns. Larger guns require greater tonnage. These differences are not essential except as they influence speed of construction.

5. I recommend (a) Contracts be let for 50 additional fleet destroyers. (b) Contracts be let for 150 additional standardized destroyers. (c) That every effort be made to have this program carried out, not only by utilizing the five ship yards now building destroyers but using any other yards that might be utilized. The building of capital ships should continue.

The country and Congress do not understand the full significance of events now passing on the sea. They can not believe that control of the sea and with it the permanent isolation of each of the Allies is gradually but surely passing into the hands of our enemies. They are fed on visions of victory through inventions yet to be made or through spectacular detached aerial effort but vaguely comprehended. The vast untraveled expanses of a barren ocean separating allies who would fight strongly together, but instead fall singly before a united enemy has not yet been pictured in their consciousness.

We of the Navy understand these things. We know that the great decision must finally be had on the land. We know that there can be no uniting of our forces there against our common enemy except by way of the sea. We know that of all enemy weapons the submarine alone may be able to prevent that union of strength. We know that of all our weapons the submarine fears the destroyer most. We know that the true answer to the submarine is to drive him from the seas with the sole vessel capable of doing it—the destroyer. We know that when this is done that war on the sea will come back to the surface. Decency and chivalry will then once more hold up their heads while Democracy comes into her own.

With an earnestness beyond expression backed by a conviction that has endured from the first, I ask that we meet this great world crisis by contributing our maximum national effort in building, manning, and fighting destroyers to drive enemy submarines from the sea.

The question of types may rest for the moment while we make the great decision to do our utmost. Let it not be said by posterity that we, seeing our duty, hesitated until it was too late, or that we failed to distinguish essential from incidental effort.

Two hundred destroyers would mean victory for us. They may be had within a year and a half.

The power to accomplish will follow the decision to accomplish.

Let us decide.

SCHOFIELD.

DEPARTMENT OF THE NAVY,
GENERAL BOARD.
Washington, July 13, 1917.

From: Senior member present.

To: Secretary of the Navy.

Subject: Number and military characteristics of a new type of destroyer.

Reference: (a) Navy Department letter 28754-26:23, of July 6, 1917.—Report of board on devices and plans connected with submarine warfare. (b) General Board's third indorsement, G. B. No. 420-14, of May 29, 1917.

In accordance with the verbal request of the Chief of Operations for the opinion of the General Board as to the number and military characteristics of a new type of destroyer recommended by a "board on devices and plans connected with submarine warfare," the General Board states as follows:

2. As no comments or recommendations of the technical bureaus of the Navy Department, having cognizance of the subject matter under consideration, accompanied this report, the General Board, in order to be fully informed, requested the attendance of the Chiefs of the Bureaus of Construction and Repair, Steam Engineering, and Ordnance, and these officers discussed from the standpoints of their respective bureaus the practicability at this time of building standardized destroyers in the number and of the type proposed.

3. From the statements made by the chiefs of the technical bureaus consulted the General Board's careful consideration of the subject and its previous recommendations in reference (b) advocating additional destroyer construction, the board arrives at these conclusions:

(a) The object sought to be attained by the construction of a standardized destroyer of the type proposed in reference (a) is to save time in order to get into service to meet the emergencies of the war a great number of destroyers with the least possible delay. With this object the General Board is thoroughly in sympathy; but the statements of the Chiefs of Bureaus of Construction and Repair and Steam Engineering lead to the conclusion that only after 30 months can the number of destroyers of the new type, reference (a), by the method proposed, be had in greater numbers than the type now under construction, and that for 18 months, which may be considered to be the critical period of the war, the type now under construction can certainly be had in greater numbers than the type proposed.

(b) To proceed with the immediate construction of 200 destroyers of the type and along the lines recommended would necessitate the taking over and operating them as a unit by the Government of the following shipbuilding companies: Newport News, New York, Cramp's, Fore River, and the Union Iron Works. All other naval construction now in hand at these yards would have to be dropped, and in addition no further work at these yards upon naval vessels, nor upon upon merchant ships, could be undertaken until the completion of the destroyer program.

(c) The labor situation at this time is a most embarrassing obstacle to enlarging the activities at these plants sufficiently to complete such a destroyer program as contemplated in reference (a). The force required would be approximately 60,000 men. The total number now employed at these plants is approximately 30,000. There is now no additional skilled shipbuilding labor immediately available from which to draw the increased force required.

(d) To suspend for two and a half years naval construction now in hand and to that extent delay the construction of other essential fleet units already authorized, or which may be authorized, will not sufficiently strengthen the existing fleet to meet a possible new alignment of powers at the end of the present war or the German Fleet if it succeeds in taking the offensive.

(e) The Chiefs of the Bureaus Construction and Repair and Steam Engineering state that the standardization and construction of destroyers of the type proposed in reference (a) at this time by the five shipbuilding firms above mentioned would encounter many difficulties and complications. These yards are now crowded to the limits of their building capacity by the work in hand and in prospect by that already contracted for. The firms controlling them would have to be persuaded or coerced to suspend work in hand, cancel contracts, remodel and enlarge their plants to do standardized and specialized work, change their methods, double their working forces, and train the new personnel.

(f) Time, a most important element in the present war emergency, would be consumed in making the necessary changes and adjustments before actual construction work could be started.

(g) Complications and delays are to be feared from insufficient supplies of the standard fittings and equipment adopted for the standardized destroyer, and from the necessity to use other equally good fittings and equipment to be readily supplied or

based in open market. For example, if in engineering it were decided to stand-
as to space and weight to accommodate a certain type of pump, that pump and no
other would have to be supplied for all destroyers, although other equally good pumps
might be available in the market.

From the statements of the Chief of Bureau of Construction and Repair, it
appears that 66 destroyers are now contracted for of the type recommended by the
general board for the building program of 1918; that six of these will be delivered by
January, 1918; 60 more by September, 1918; that probably 50 in addition, if contracted
or now, can be delivered by January, 1919; and that boats in excess of this number
may be turned out subsequent to January, 1919, at the rate of one or two a month.

From the statements of the Chief of Bureau of Steam Engineering, it appears
practicable, so far as propulsive machinery and the equipment under cognizance of
that bureau are concerned, to complete the above program—that is, to complete the
boats now contracted for by September, 1918; 50 additional by January, 1919, and
to provide for additional boats after that date.

From the statements of the Chief of Bureau of Ordnance it appears practicable
to supply the 50 additional destroyers with 5-inch guns by January, 1919. If 200
5-inch guns are contracted for now deliveries will probably commence by January,
1919, and if sufficient numbers of new guns are not ready by the time the destroyers
are ready, their batteries could be completed by taking guns from other naval vessels
and merchant ships temporarily supplying their places with 4-inch guns of which
2,000 are now under contract. In this connection the general board is of the opinion
that, in order to cope with the heavy armament now being installed in the larger type
of German submarines, 5.9-inch caliber—and to prevail decisively against the larger
destroyers now building abroad, it will be necessary to increase the caliber of guns
carried by future destroyers to 5-inch.

4. In view of the above considerations, and especially in view of the opinions of the
chiefs of the technical bureaus consulted that no time can be saved in getting boats
of the type proposed in reference (a) into service in the present congested condition
of the country's shipbuilding industries; and further, that more boats may be expected
in 18 months of the type building under the present method than by that proposed,
the general board makes the following recommendations:

(a) Proceed with the construction of boats of the type recommended by the general
board for the building program of 1918; but, as an emergency measure, the contract
speed of 35 knots may be reduced, but not below 30 knots for acceptance.

(b) Contract now for the construction of 50 additional destroyers of the present
type, to be completed by January, 1919. The general board does not recommend a
larger number at this time because of the impracticability of getting more into service
in the next 18 months.

(c) Install batteries of four 5-inch guns and one antiaircraft gun.

(d) Contract now for two hundred 5-inch guns.

CHAS. J. BADGER.

WASHINGTON, D. C., July 14, 1917.

To: Secretary of the Navy.

Subject: Destroyers—Special 1918 program.

Reference: (a) Report of board on devices and plans connected with submarine war-
fare (undated). (b) Department's letter No. 28754-26:23 (undated). (c) Special
1918 destroyer characteristics. (d) Department's letter No. 8557-238 of 7 July.

1. Reference (a), page 10, paragraph (b), recommends that 200 destroyers of a new
type to meet certain military characteristics of the department be immediately
constructed.

Reference (b) approves reference (a).

Reference (c) contains the military characteristics which briefly specify: Speed,
28 knots; guns, four 4-inch; tubes, 4 triple.

Reference (c) also specifies that all destroyers of this program be built from identical
plans and be standardized in every particular of hull, machinery, boiler, auxiliaries,
fittings, and equipment.

Reference (d) approves reference (c) and directs that plans and data be prepared
with the utmost expedition.

2. The following report indicates the shipbuilding facilities that are necessary in
order to carry out this program, assuming that these 200 destroyers, in addition to those
now building, shall be ready for delivery in January, 1919, 18 months hence:

In order to build destroyers with expedition, it is necessary that the work be in the
hands of people who have had experience in this line. While it would be possible, in
time, to obtain destroyers from firms that have not hitherto built them, our past

experience indicates conclusively that this can not be done with expedition. At the five large shipbuilding plants—Newport News, New York Shipbuilding Co., Wm. Cramp & Sons, Fore River Shipbuilding Corporation, and Union Iron Works—there are now building 49 destroyers, the deliveries of which are due subsequent to January 1, 1918.

3. The first contract date of delivery of any of these vessels was originally September 30, 1918, but the department has already taken steps to speed up the construction of these vessels with a view to having as many as possible completed by the beginning of next year. Assuming that delivery of the 49 vessels above will begin on January 1, 1918, launchings should begin not later than November 1, 1917. To launch these vessels, and an additional 200 before January 1, 1919, would mean about 18 destroyers per month, or about one a week by each of the five companies referred to, if the work were assigned to them. This would require at each yard not less than 12 and probably 15 ways assigned as building berths for destroyers. It is mechanically possible to provide these if the yards are devoted exclusively to destroyers.

4. To build the hull and machinery for the total number of destroyers above referred to would require on the average the labor of 60,000 men. This is nearly double the total number of men now employed on all work by the five big shipyards above referred to. In order, then, to carry out the proposed program it would be necessary not only to employ the entire capacity of the five largest shipbuilding plants in the country on destroyers, to the exclusion of all merchant and other naval work, but to practically double their capacity either at the yards proper or through subordinate companies.

5. In order to carry out the program in the manner desired; that is, to insure complete standardization, it would be necessary practically to merge these five plants into one organization, under one management. This would necessitate the delegation by the President, to one man, of very large powers. To accomplish such an unprecedented program, however, would, in our opinion, require that complete authority, as well as responsibility, should be vested in one man, who would be charged with this work to the exclusion of all other duties, and with preference as regards material and labor over all merchant shipbuilding and any other conflicting military preparations.

6. In the opinion of the bureaus, time would be saved by complete standardization only if it is the intention of the department to continue to construct destroyers at the maximum capacity of the country for at least 2 years and possibly 30 months. If it is the department's desire to obtain the greatest number of destroyers practicable during the next 18 months, we believe it would not be wise to undertake the construction of a new standardized type, but that the maximum results be obtained by duplicating the vessels now under construction, with omissions rather than changes. Owing to the gearing situation, it might be necessary to use direct drive instead of the geared drive in some cases, but one builder is already undertaking the construction of destroyers with direct drive, and this machinery can be duplicated with a minimum delay by other builders should they be unable to obtain the gearing.

7. The additional number of destroyers which could be completed by January, 1919, along the above lines, without materially interfering with the construction of submarines, and without entirely stopping the construction of merchant ships at the large yards, but slowing up all large naval vessels as necessary to avoid interfering with destroyers, can be determined only by detail investigation and consultation with the shipbuilders. We estimate, however, that they would be between 40 and 50. This might involve special measures to increase the facilities at the shipyards, and undoubtedly would require that special consideration be given destroyer material.

8. It is recommended that the bureaus be authorized to take up at once with the shipbuilders the possibilities in the way of construction of destroyers by January, 1919, along the lines indicated above. Orders should be placed at an early date so as to relieve as much as possible the material situation by allowing it to be ordered well in advance.

GRIFFIN.
TAYLOR.

Paragraph 14 of Admiral Sims's letter is as follows:

14. The headquarters in Europe was not infrequently left in ignorance of the department's policies, plans for operation of United States forces, and its intended action upon my many dispatches. Not until July 10, 1917, did the Navy Department outline a policy as regards naval cooperation with the Allies—in a cable quoting a letter to the State Department.

Paragraph 14. The policy letter of July 10 was drawn up and signed on July 3, 1917, by the secretary. It remained a standard theme throughout the war. After June 25 I personally handled

every dispatch of Admiral Sims, as well as all other dispatches, and prepared answers at the time of their receipt for the approval of the Chief of Naval Operations and the secretary on matters pertaining to policy, plan, and operation. As many of Admiral Sims' dispatches were repetitions it was not necessary to answer all of them. The policy laid down in the letter of July 3, while it may have seemed new to the admiral, was in fact the department's guiding standard since we entered the war.

I will not read that letter. It has been read a great many times.

At the same time that I submit that letter I will submit two other documents, which I have marked C-2 and C-3, which are Admiral Mayo's reports on his visit to the British Admiralty, and his statements, which we are already familiar with, as to the conditions of policy with the British Admiralty when their policy went into effect, which was at a date later than ours, even though they had been at war since 1914; so that our policy arrived in London practically coincident with the policy of the British Admiralty, but at a trifle earlier date. I submit these extracts from Admiral Mayo's report, which has already been put in in full.

The letter and the two extracts referred to above are as follows:

NAVY DEPARTMENT,
Washington, July 3, 1917.

Confidential.

SIR: Referring to the cablegram from Ambassador Page in London, dated June 23, 1917 (copy attached). After careful consideration of the present naval situation, taken in connection with possible future situations which might arise, the Navy Department is prepared to announce as its policy in so far as it related to the Allies—

(1) The heartiest cooperation with the Allies to meet the present submarine situation, in European or other waters, compatible with an adequate defense of our own home waters.

(2) The heartiest cooperation with the Allies to meet any future situation arising during the present war.

(3) A realization that while a successful termination of the present war must always be the first allied aim and will probably result in diminished tension throughout the world, the future position of the United States must in no way be jeopardized by any disintegration of our main fighting fleets.

(4) The conception that the present main military rôle of the United States naval forces lies in its safeguarding the lines of communication of the Allies. In pursuing this aim there will, generally speaking, be two classes of vessels engaged—minor craft and major craft—and two rôles of action: first offensive, second defensive.

(5) In pursuing the rôle set forth in paragraph (4), the Navy Department can not too strongly insist that in its opinion, the offensive must always be the dominant note in any general plans of strategy prepared. But, as the primary rôle in all offensive operations must perforce belong to allied powers, the Navy Department announces as its policy that, in general, it is willing to accept any joint plan of action of the Allies, deemed necessary to meet immediate needs.

(6) Pursuant to the above general policy, the Navy Department announces as its general plan of action the following:

(a) Its willingness to send its minor fighting forces, comprised of destroyers, cruisers, submarine chasers, auxiliaries, in any numbers not incompatible with home needs, and to any field of action deemed expedient by the joint allied admiralties, which would not involve a violation of our present State policy.

(b) Its unwillingness, as a matter of policy, to separate any division from the main fleet for service abroad, although it is willing to send the entire battleship fleet abroad to act as a united but cooperating unit when, after joint consultation of all admiralties concerned, the emergency is deemed to warrant it, and the extra tension imposed upon the line of communications due to the increase in the number of fighting ships in European waters will stand the strain imposed upon it.

(c) Its willingness to discuss more fully plans for joint operations.

Sincerely, yours,

JOSEPHUS DANIELS.

The honorable the SECRETARY OF STATE.

TAKEN FROM ADMIRAL MAYO'S REPORT AFTER VISIT TO EUROPEAN WATERS.--
GENERAL IMPRESSIONS REGARDING CONDITIONS IN BRITISH ADMIRALTY.

OCTOBER 11, 1917

Paragraph 5. (a) There is little doubt that the British Admiralty is at a loss when asked for the history of the war to date. Reports of operations are so isolated and scattered and without system that there is not available any comprehensive record of original plans, the governing reasons therefor, and the degree of success or failure in each case. The inevitable inference is that the war has been carried on from day to day and not according to any comprehensive policy to serve as a guide to plans looking to the effective coordination and cooperation of effort against the enemy.

(b) It is apparent that despite the so-called war-staff arrangements put into effect in the Admiralty during the past three years, until very recently there has been no planning section, nor was there any definite body of men charged with the function of looking ahead, or even of looking back to see wherein lay the causes of success or failure, nor any means of furnishing the heads of the Admiralty with analyses and summaries of past operations in order that decisions as to continuing old operations or undertaking new ones might be reached with a due sense of "perspective," both as to past operations and as to the coordination of new operations in a general plan.

(c) The statement of present Admiralty policy, originally dated July, 1917, now revised to September 17, 1917 (reference (b) and inclosure B is not really a statement of policy, but rather a summary of current activities). That these activities are based on an underlying idea of the defensive may readily be inferred from the leading words in the subparagraphs of paragraph 1 of the paper referred to, namely, "protection," "prevention," "protection," "resistance." See also references (h), (i), (j) and inclosures H, I, J.

(d) The statement of proposed future Admiralty policy dated September 17, 1917 (reference (c) and inclosure C), indicates growing appreciation of the necessity for more energetic offensive measures against the submarine in the way of preventing his egress from the North Sea.

(e) While the development of the submarine menace has been gradual and measures undertaken to meet it have had to be evolved and applied to new developments as they appeared, the present dispersion of allied naval effort against the submarine menace has reached large dimensions and the actual offensive against the submarine has suffered through the accumulation of large numbers of vessels to carry out protective measures. The number of vessels engaged in protective (defensive) effort includes practically the entire British Navy in northern waters except the Grand Fleet, many of whose destroyers and other small craft are also engaged in protective work.

(f) Referring again to the proposed plan of future antisubmarine operations in the North Sea (reference (c) and inclosure C), it appears that it may be necessary to withdraw some vessels engaged in protective work in order to make the offensive effective. However, the effectiveness of the offensive should be cumulative, thus enabling perhaps nearly all the available vessels gradually to be diverted from the protective (defensive) to the offensive.

[Taken from Admiral Mayo's report after visit to European waters, Oct. 11, 1917.]

NOTES ON THE GENERAL NAVAL SITUATION.

Paragraph 13. (a) Apparently the naval plans of the Allies have been in most general terms. Great Britain to control the North Sea and Channel; France her west coast and the French Mediterranean Coast; Italy, assisted as necessary by France, to control the Adriatic, British forces based on Gibraltar, Malta, Alexandria, assisting in the Mediterranean. Recently the Japanese have given assistance in the Mediterranean, having there 1 cruiser and 12 destroyers. United States forces are operating from Queenstown, Brest, and Gibraltar.

(b) (1) It is apparent from conversations with officers attached to the Operations Divisions that up to the present there have been no definite naval plans. So far as can be learned there has been no statement of British naval policy previous to that issued by the Admiralty in July, 1917, which is in reality a defense of what was being done and not a real statement of policy.

(2) The defensive nature of this so-called policy is plainly indicated by the paragraph stating the objects to be attained by naval power: the leading words of the four subparagraphs which state these objects are: (1) Protection; (2) prevention; (3) protection; (4) resistance.

(3) All of these objects and many more would be obtained by the destruction of an naval power.

1. In the first month of the war the offensive policy was much more pronounced than at present. The British fleet was, in fact, undergoing a test mobilization when the probability of war became evident. The forces were maintained in a mobilized condition, and therefore began the war in a most advantageous state.

The disposition of the fleet was made with a view to opposing the movements of enemy forces out of the North Sea. The main battle fleet was based in the North Sea, but kept the sea almost continuously. A second battle force was based to the south of England to prevent the passage of any force of less strength than the main Sea Fleet through the Channel. The armored and light cruisers were continually on scouting duty in the North Sea. The British submarines were stationed in the Helgoland Bight with a view to attacking the German fleet if it came out. Mines were laid in Helgoland Bight by the British during this phase.

The frequent attacks on British cruisers by German submarines, especially the catastrophe in which the Hogue, Cressy, and Aboukir were lost, caused a change in plan as follows:

The main fleet was withdrawn from continuous service underway and placed in a base adequately protected from submarines. The heavier cruisers were withdrawn from scouting work and their place taken by light cruisers and destroyers. The mining of Helgoland Bight was begun. The development of the auxiliary services of mine sweeping and patrol was made more rapid.

The present operations are merely developments of this plan. The fleet is ready and anxious to fight a major action, but it is only sent to sea as a fleet when the German fleet is out or thought to be coming out, or occasionally for exercises. The various divisions of the fleet are often under way for target practice, etc.

See references (h), (i), (j) and inclosures H, I, J.

Paragraph 15 of Admiral Sims's letter is as follows:

15. As usual in such cases, the policy thus set forth was academically sound, but that it was not carried out, or was not understood by the department, is shown by the fact that for 10 months after its receipt I was still urgently recommending an increase of forces—still trying to convince the department that the war was in the eastern Atlantic; that the United States naval front was off the European coast and not off the United States coast; that it was there only that the naval enemy was operating; that it was there only that United States shipping, let alone allied shipping, could be protected with the maximum efficiency.

Paragraph 15. This policy was perfectly understood by everybody in the department, and was accepted as standard doctrine.

Paragraph 16 of Admiral Sims's letter is as follows:

16. A review of the dispatches makes it apparent that the department did not accept the reports and recommendations with the seriousness that the critical situation demanded. There are many instances that illustrate this. One that may be cited is the case of our battleships that were requested as reinforcement of the Grand Fleet.

I beg you to take particular notice of that expression "reinforcement of the Grand Fleet," as expressed in his letter of January 7, 1920.

As to paragraph 16, I remember the cable, and upon its receipt a cable was drafted in reply. The reason why these ships were not sent at that time can, of course, best be explained by the Chief of Naval Operations. I am, however, under the impression that the cable sent by Admiral Sims did not sufficiently impress the Chief of Naval Operations with the gravity of the situation, and that he did not wish to break up the organization of our battleships unless it were absolutely necessary to do so, feeling that we might be called upon to use these units as a whole, and as a reserve. Personally, I was not in accord with this policy as I favored making concessions and sending the ships at once, but Admiral Benson's views turned out to be correct in the end, as nothing happened to justify the fears expressed. In fact, in this case the gravity of the situation as regards the Grand Fleet, if such existed, was not stated in such definite terms as to leave no doubt in our minds. The reason assigned, viz, that the Admiralty contemplated placing five of the King Edward class

out of commission to get the personnel for other craft, did not carry such weight with it as a simple statement to the effect that "the Grand Fleet required reinforcement" would have carried. To have obtained quicker results it would have been better had Admiral Sims presented his views in the manner outlined.

In this connection with regard to many of Admiral Sims's despatches, had he confined himself to simpler statements and repeated himself less he would have presented his views better and would have eliminated the chance of being judged to have overstated his case. From long experience with Admiral Sims in the past, I seldom misunderstood him, but to others less familiar with his methods, his real attitude of mind was not so apparent. This is merely given as my judgment, but I believe it to be correct.

Paragraph 17 of Admiral Sims's letter is as follows:

17. Following a conference with Admiral Jellicoe, then first sea lord, or "chief of naval operations," of the British Admiralty, and Admiral Beatty, the commander in chief of the Grand Fleet, it was strongly recommended on July 21, 1917, that four of our coal-burning battleships be sent at once. There was great delay before there was even an acknowledgement of this request. This naturally subjected me to much embarrassment. The request, though repeated, was finally refused.

Paragraph 17. This matter was handled immediately by me and a favorable reply drafted. The answer was not sent immediately and then it was not a favorable one. The question was being weighed by the Chief of Naval Operations and the Secretary, I think.

Paragraph 18 of Admiral Sims's letter is as follows:

18. In the following November the Chief of Naval Operations arrived in England with the Col. House mission. After discussing this question of the necessity of sending our battleships with the same officials with whom I had discussed it, he cabled at once recommending that they be sent. The result was that it was over four months after the original request (November 28) that the four ships sailed from the United States.

Paragraph 18. Correct. Cable to that effect was received from Admiral Benson, who was then in London. The matter was taken up immediately by me with the Secretary, and his approval to the plan secured at once. Admiral Mayo was called up in conference at the office. The ships to go were selected, the admiral to command was picked out, and the ships were dispatched as soon as they could be made ready. The ships were docked at this time to give them the last finishing touch before sending them out to fight. This is common naval practice where it is possible to carry it out, and it is sound. From the date of receipt of order to proceed until the date of arrival at Scapa Flow was one month less one day, I believe. The ships had a very severe winter passage over.

Paragraph 19 of the letter is as follows:

19. This is but one of a number of examples of a similar kind, and strikingly illustrates the nature of the delays caused by the department's insistence upon trying to understand the intricate details of rapidly changing conditions 3,000 miles away. As it was of course a physical impossibility to keep the department fully and accurately informed, and as the department insisted upon making decisions concerning both the disposition and the actual operations of the European forces, the inevitable result was unsound decisions, and in some cases long delays before the department was induced to accept the original recommendations that were based upon exhaustive discussions of the actual conditions with the heads of the allied navies.

Paragraph 19. This statement, in my opinion, should not be accepted at its face value. All information relating to plans and poli-

ries, unless the urgency of the situation demanded instant action, should be sent to the department to decide upon. We were, in the summer of 1917 when the office of communications had been established in the office of operations, in complete control of the radio and cable situation, handling easily some 2,000 dispatches daily. In addition to naval dispatches we were handling some of the cable work for the Army and some of the similar work for the State Department, principally because our cipher codes were better. We were daily in receipt of cables from Admiral Sims, going into minute detail as to his material, personnel, and supply needs. These cables used hundreds of words and were in cipher. It was a much simpler matter to give a general explanation of a plan or policy and most necessary to do so. It would be an unsafe act of the department to inaugurate the principle of cutting itself adrift from the broader phases of plan and policy in the war zone, and to leave these decisions entirely in the hands of its naval officer in command there. The department at home must keep its hands on such matters, or else it might become involved in affairs which had not received the approval of the home government and which might commit our country to actions not approved here. The commander of our forces in European waters had full authority within his own realm of discretion and his judgment and advice were always given paramount weight. On the other hand, for the department to interfere with him in matters of detail pertaining strictly to his own forces and not involving other forces, was an error. Without doubt the department committed some such errors, though I do not recall specific instances. Though they might be embarrassing at times, there were none made which affected the favorable outcome of the war.

Paragraph 20 of the letter is as follows:

20. Judging from the actions that were finally taken, after extensive cabled and written communications, and consequently long delays, it is apparent that if I could have appeared daily in Washington to explain fully my recommendations, and the discussions before the conferences upon which they were based, they would undoubtedly have been carried out from two to six months earlier. The point is that if the department considered that there was anyone in Washington more competent to form just conclusions, he should have been sent to Europe for that purpose; but, failing this, the recommendations of the Navy Department's representative, based upon conferences with the allied commanders, should have been accepted and immediately acted upon. The action of the department in this respect was a violation of a fundamental principle of warfare—see Mahan or any authority—and it was continuous throughout the war. It added greatly to the burden of my work.

Paragraph 20. The Chief of Naval Operations and the Secretary of the Navy, in so far as I know, had the fullest confidence in Admiral Sims. His reports were excellent and there is no officer in the service who could have done the work he was doing better, or even so well. He understood our need for information and the desirability of spreading it effectively. He kept the department well informed. During the war it was thought that the closest cooperation existed between his office in London and our office in Washington.

The Chief of Naval Operations has often said, if I recollect correctly, that he could not find another officer to take Sims's place. There is a marked difference between having the fullest confidence in an officer, being guided by his opinions and judgment, and giving over to that officer the complete power to make ultimate decisions beyond the scope of those he ought legitimately to make. It is no violation of

the principles of Mahan, nor of the dictates of common sense, in a war of this magnitude, where so many of the influencing factors lay outside of the war zone, and in our own country, for the department to keep a general hand of the situation. Whatever criticisms is made should not be directed at the principle, but at the practical working of that principle, if just criticism there be. When all is said, in broad matters, it was not Admiral Sims's final decisions that were needed, but the final policy and decision of the home Government back of him, based on his preliminary views and directed by his judgment at the front. Request after request was made by Admiral Sims, and were acted upon immediately by the department, but he in turn does not seem to realize the difficulties confronting those whose duty it was to supply the demands made.

Paragraphs 21 and 22 of the letter of Admiral Sims are as follows:

21. There was great delay and reluctance in accepting the indisputable fact, which should have been apparent to anyone, that the critical sea area was in the eastern Atlantic in the so-called submarine war zone; that the submarine campaign could be critical and could affect the ultimate decision of the war only in that area

22. This attitude in Washington greatly slowed the sending of the necessary assistance, and necessarily resulted in prolonging the war.

Paragraphs 21 and 22 can not be concurred in. The officers at home in the Office of Operations were men trained in the same school of thought as Admiral Sims and were loyally giving him their full support. There is no office in the department to which he is more indebted. From the Secretary down there was not, from the time I entered the office, the slightest doubt as to where the war was being waged. We knew it even before he told us. Every plan—and there were many—every effort, was directed toward throwing our effective forces there. The results were by no means as satisfactory as any of us desired, but the reinforcements demanded can not be created in a day and moved like pawns on a chess board. The difficulties confronting us could not have been fully appreciated, or so sweeping a statement would not have been made.

Paragraph 23 of the letter is as follows:

23. It would seem to be self-evident that the department could not possibly have been kept completely informed in detail, by cable code messages, of the actual situation in the war zone, and particularly of the rapidly changing conditions during the critical period of the war in the summer of 1917.

Paragraph 23. The department was kept wonderfully well informed by Admiral Sims. We had a fund of information accumulated in the office through cables from the admiral, through his letters and reports, and through the literature furnished us by the Admiralty through Admiral Sims. The work he did in this respect was deserving of every praise.

Paragraph 24 of the letter is as follows:

24. As a matter of fact, this was a physical impossibility during all of that most critical period. The work of collecting the necessary information, or even the purely mechanical work of transcribing it, would have been away beyond the physical capacity of one man assisted by the one aid I was allowed during that time. The best that could possibly be done was to keep the department informed by cable in a general way of the conclusions reached by the various discussions with the allied commanders at the "front" and of the decisions based thereon.

Paragraph 24. Admiral Sims has a just complaint in this case. He should have been allowed more assistants, and earlier. It was

impossible to meet all his demands, but greater effort should have been made in the beginning, I think.

Paragraph 25 of the letter is as follows:

25. In cases where the department declined to approve such decisions the only course was to try to explain by letter as fully as time and insufficient assistance would permit. The result was, of course, long, embarrassing, and dangerous delays.

Paragraph 25. The gist of this paragraph seems to be that Admiral Sims has a cause for complaint because the department did not accept all his recommendations and act on them favorably, without reserving the right of ultimate decision for itself. In all cases of an unfavorable decision the department accepted the responsibility for it. It was not placed on Sims's shoulders. Had the ultimate outcome of these decisions been disastrous, Admiral Sims's claim would have had more force, but it was not so. On the whole, the Navy did play a successful rôle, as successful a rôle as a Navy which was not prepared specially a long time ahead to enter this particular kind of a war could have been expected to play.

Paragraph 26 of the letter is as follows:

26. If the department had promptly accepted the recommendations made, beginning four days after my arrival abroad, and continuing for some months, and had sent at once all the destroyers and other craft which were finally sent in the next four or five months, it follows that the United States naval intervention would have been much more efficient.

Paragraph 26. The department did accept this information as indicating the true state of affairs, and it gave heed to the recommendations of Admiral Sims. From the date I entered the office I know that the accepted doctrine was "the war is over there." The forces did not go over as fast as any of us desired, but the reasons for it do not lie in the failure to accept the recommendations made. The failure to get into the war immediately, in full force, upon the declaration is not the fault of Operations or the failure to recognize the character of the war, and where it was being waged, but were, for the most part, due to natural causes and to causes which antedated our entry into the war. It was not possible to press a button and move ships, men, and supplies with the rapidity desired either by Sims or by the department. All of the destroyers were not ready to move instantly; navy yards and mercantile shipyards were not ready to undertake the vast amount of work thrown at them. Submarine chasers had to be built. Tugs had to be bought, refitted, and built. Yachts had to be bought, stripped and made ready for war service. The transports, which were the seized German ships, had to be repaired, manned, and put into service. Other transports and supply ships had to be built. Arrangement had to be made with the Army for the transport of its great military force to Europe.

The reorganization and expansion of the Office of Operations and of the bureaus had to be undertaken. The coordination of the bureaus with this office had to be developed; the methods of administration had to be divested of their prewar conservatism, the red tape abolished, and more authority given to subordinates in the matter of detail; habits of quick and accurate thinking and quick decision under the stress of war, had to be developed. The personnel had to be expanded and trained; the task of creating sufficient reserves of war supplies had to be undertaken. The organization of the various

bodies which acted as the cooperating agents between the Navy Department and all other departments and with the allied representatives on this side of the water had to be undertaken. Certain essential problems of home defense had to be undertaken. Though we knew that the immediate and pressing problem was the suppression of the submarine menace and acted in accordance with this knowledge, we also knew that this problem had to be considered in connection with all the other problems I have outlined. Our country could not afford to make any disjointed effort nor to move forward along any one line of action, without due consideration of all lines. We had to profit, if we could, by any previous mistakes of our allies, and we had to prepare for the contingency of a long war. The situation demanded of us that we should make a united, powerful effort, and in this effort the naval establishment had to play its appointed rôle, in harmony with every other effort our country was putting forth. Every master of military warfare and naval warfare knows that the great general's first concern is with the reserves. The weight of the first blow is ultimately controlled by the strength and coordination of the reserves. To build up our reserves was one of our naval problems and had to be considered at the same instant we were called upon to strike at the front.

All of these conditions were difficulties to surmount. They retarded the flow of ships and supplies to Admiral Sims, but the spirit was willing, and the principles he laid down were, in the main, accepted. He always had back of him the loyal support of the office of operations and of the bureaus.

Paragraph 27 of the letter is as follows:

27. I realize that it is difficult at the present time to believe that any policy involving such delays could have been persisted in, particularly when combined with a failure to comply with my requests for additional staff officers to assist my one aid; but a review of the dispatches and letters exchanged with the department during this period (the first four months of the war) will show that the department insisted upon the impossible; that is, upon full and detailed substantiation of every proposition advanced, even many of those concerning the disposition and handling of the naval forces in actual contact with the enemy.

Paragraph 27. I wish to emphasize the fact that this policy of delay, so styled, was not persisted in so far as my particular work is concerned. In this matter I can vouch for the attitude of every person in the department with whom I came in contact, from the secretary down. In my opinion Admiral Sims was not given an adequate staff early enough and I think this should have been done at the expense of every other activity, if necessary. It was a difficult task to accomplish satisfactorily, when all the other necessary activities in which we were engaged are taken into account. However, it should have been done. If the admiral was handicapped by interference with the movements of his force in contact with the enemy, this was wrong in principle. He has cited instances and I have yet to note one which materially affected the outcome of the war.

Paragraphs 28 and 29 of the letter are as follows:

28. For example, in the above-mentioned statement of policy, from the Navy to the State Department, a copy of which was sent me, it is clearly set forth that readiness completely to cooperate by sending our light forces abroad was dependent upon the condition that the Allies should keep the department fully informed through me of their plans and intentions.

other words, while the department's first statement of policy (which was by 1917, or three months after we entered the war) was what I had recommended since the beginning, it nevertheless withheld putting it into effect, apparently of a conviction that the Allies were not keeping it fully informed of

statement in paragraph 29 shows that he had already accepted policy of the Navy Department that went out to him on July 2 of the policy that should be adopted, and there is nowhere in that letter or any other cable that was sent—and I know, because I had that letter—any statement that we were holding back because he had failed to give us information.

reason therein given by Admiral Sims as the department's for our failure to reinforce him as rapidly as he desired, was that the Allies had failed to give the department full and complete information and that therefore the requested aid was withheld. This implies definite knowledge of the department's motives in this or else it is an assumption based on his own opinion. From the middle of June until the signing of the armistice, I can state that to the best of my knowledge no such motive as he claims existed, and I do not recollect any such information having been sent abroad to the department. We entered the war in the middle of April, and of necessity our organization had to go through the transition from a peace basis to a war basis. Before we entered the war, our naval establishments were on a peace basis and our forces were enjoined to preserve neutrality. It would be far more just to ascribe the failure to achieve the desired results immediately, to the difficulties attending the transition from peace to war than to an ungenerous attitude which was not true. I doubt whether we shall ever be prepared to wage effective war at the instant of its declaration. As a man, I do not believe that our democratic form of government accustoms itself to the same instant readiness to strike other nations as an autocratic form of government does. Yet in the end, we are to be thankful. We may be slow to start but later we gain an impetus and momentum which no militaristic form of government can equal, due to the united force of a free people joined together for a common purpose. These were our two conditions at the beginning and at the end of this war. We ran true to form.

The loss in efficiency at the beginning was more than counterbalanced in the end. In this particular war we were fortunate in having even a period for preparation, due largely to the fact that the control of the sea was held by the British fleet, and that barring the line, the German fleet was contained. Had the situation been reversed and had the German fleet controlled the sea, our preparations in preparation would have been greatly increased, if not made impossible. Gentlemen, the statement made in Admiral Sims's paragraphs 28 and 29 is not correct, whatever the inferences which he draws from cables, etc.

Paragraph 30 of Admiral Sims's letter is as follows:

The truth of the matter was that nothing was being withheld, and that all plans which were in writing, which were actually of an official nature, in any way affected United States naval cooperation, had been transmitted to the department as completely as long distance communication—coded—permitted.

Paragraph 30 is entirely correct. We were in receipt of the full information at all times. The cooperation which existed be-

tween ourselves and the governments with which we in this war seemed excellent in naval matters.

Paragraph 31 of the letter is as follows:

31. Certain suggestions were made by the British Admiralty in the campaign. For example, in April, 1917, there was an suggestion that we should attempt a raid in the Channel with a heavy force and get it to be intercepted by a force from the Grand Fleet, the nearest base of which was near Edinburgh. Accordingly, the Admiralty suggested that a squadron of ships be based on Brest or in the Channel. No reply was made. Also, the value of submarines in the campaign was first explained. None were sent until October, 1917, when five arrived in Ireland. More in January and February, 1918.

Paragraph 31. I do not recall now the suggestion of a squadron of battleships to Brest or channel ports. It was in the office in an executive capacity. No direct order was ever made for such forces at any time I was in the office. In the case of the ships to reinforce the Grand Fleet, discuss where.

I will read you a summary of the situation concerning our submarines to the war zone, compiled from data of the office of operations:

[Extract from letter from Admiral Sims dated Apr. 19, 1917.]

SUBMARINE VERSUS SUBMARINES.

There has always been opposition to using submarines against submarines on the grounds that the possibilities of their accomplishments were not sufficiently great to justify the risk involved of mistaken identity and damage to friends.

The director of antisubmarine warfare believes, however, that such promises will, and the experiment is now being tried with as many submarines as can be spared from the Grand Fleet.

Some enemy submarines have been destroyed by this method, usually by surprise. One valuable feature of this method lies in the fact that as long as our submarines are not so used, the enemy submarine is always perfectly safe in assuming that all submarines sighted are friends. If this certainty is removed the enemy is forced to keep down more and to take much greater precautions against detection. This is an advantage of no small amount.

In addition to the possible offensive work that may be accomplished by submarines on such duty, the plan furnishes us with more reliable information as to the limitations and capabilities of enemy vessels under the actual conditions in the areas in which they operate. Without this knowledge based on actual experience too much is left to conjecture which is liable to lead to a great deal of misdirected effort.

MEMORANDUM RE S/MS, STATIONS AND DUTIES.

1. In a general report, by letter dated April 19, 1917 (date of receipt in department not known), Admiral Sims set forth the probable usefulness of allied S/Ms against enemy S/Ms. No definite recommendation, the letter being in nature of a report setting forth the situation.

2. On June 30, 1917, Admiral Sims in replying to certain proposals in a department paper dated April 17, 1917, cabled that "All S/Ms we can send to Irish coast will be invaluable there." etc.

3. On July 2, 1917, department directed C. in C. by letter to designate 12 S/Ms for European service and set August 15 as tentative sailing date. On July 11, C. in C. designated 12 S/Ms and made certain recommendations concerning them out; all but one of them had been at navy yards since early in May undergoing extensive repairs and alterations. Department issued final orders by letter dated August 15, 1917, directing preparations for S/Ms going on distant service.

4. Admiral Mayo cabled August 29, 1917, "After consultation with Admiral Jellicoe, Beatty, and Sims, recommend sending one division of S/Ms to Azores. There had been messages between department and Admiral Sims concerning the question of waters of Azores prior to this."

governments with... in naval matters... is as follows... by the British... April, 1917, the... with a heavy for... Fleet, the nea... rally suggest... nel. No repl... campaign wa... five arrived... call now... channel... capacity... ne I was... le Grand... situation... piled from... dated Apr... MARINES... times... acc... stated...

ready, four K class S/Ms sailed for Ponta Delgada with Bushnell as own tender not being ready. Sailing date, from New London, was arrived October 27, and Bushnell returned immediately.

and L class S/Ms. with Bushnell and three tugs left navy yards November 4, 1917, for Azores December 4, 1917. Expedition was broken up by very stormy weather; four S/Ms and Bushnell arrived Ponta Delgada December 24 and were held there by Admiral Sims's order until January 1918.

summer of 1918 there were several despatches between department, and Admiral Dunn (Azores), concerning unsuitability of K class S/Ms for relief by better S/Ms was recommended and decided upon. Relieving force arrived just before signing armistice.

spring and early summer of 1918, Admiral Sims did not recommend our S/Ms in Irish waters and in connection with information concerning visits of German S/Ms to Atlantic Coast pointed out that our S/Ms were the best measure to use.

department's cable of September 9, 1918, stated that there was great concern over enemy S/Ms activities along our troop lanes west of Brest, suggested operating S/Ms in that locality and asked if the O class S/Ms were wanted abroad.

Admiral Sims's cable of September 13 stated that S/Ms were proving of little use in hunting there, gave statistics of enemy S/Ms destroyed by allied S/Ms for months and ended, "It would, however, be desirable to send the O boats to intensify our search efforts in other equally important areas."

Admiral Sims's cable of October 3, 1918, then stated "Owing to lack of success in operations against S/Ms west of Brest, admiralty proposes adopting department's plan and sending S/Ms to operate in this area" and stated that sending O boats would improve chances of success.

Savannah's division of 8 O boats which had been engaged on antisubmarine duty on Atlantic coast was immediately sent to navy yard to dock, sailed from New York November 2 and arrived at Azores after the armistice.

THOS. C. HART.

was in charge of the submarine division of operations. He was also in command of the L-boats that went abroad, to Queenstown. I would like to submit this table in connection with that report, owing to the testimony that has been submitted by Admiral Sims as to the unsuitability of our submarines. I think every naval officer knows that they were not what they should be, and we wanted better, but it might be interesting to note that these tests, which we supposed to be very poor, performed as well as—will not say better than—any of the submarines that were over on the other side, as this table submitted will show. It will possibly be interesting for me to read a few lines of it.

Capt. Pratt here read the table referred to, which is here printed the record as follows:

Submarine Division 5 performances from Dec. 1, 1917, to Nov. 1, 1918.

| | AL-1 | AL-2 | AL-3 | AL-4 | AL-9 | AL-10 | AL-11 |
|-------------------------------------------|----------|----------|----------|----------|----------|----------|----------|
| Number of days at sea..... | 115.9 | 125.4 | 134.0 | 90.2 | 108.0 | 136.6 | 106.2 |

| Lubricating oil used, gallons..... | 12,956.0 | 15,379.0 | 12,767.0 | 10,944.0 | 16,084.0 | 19,765.0 | 13,272.0 |
| Exercise torpedo runs..... | 12.0 | 10.0 | 11.0 | 14.0 | 8.0 | 15.0 | 12.0 |
| Torpedoes lost..... | 1.0 | 1.0 | | | | 2.0 | |
| Torpedoes wrecked..... | | 1.0 | | | 1.0 | | |
| Number times enemy sighted.... | 3.0 | 5.0 | 2.0 | 5.0 | 1.0 | 2.0 | 3.0 |
| Times enemy attacked with torpedoes..... | 1.0 | | | 2.0 | | | 1.0 |
| Number torpedoes expended.... | 4.0 | | | 5.0 | | | 2.0 |

The CHAIRMAN. Does that "times enemy attacked with" mean that the enemy attacked us?

Capt. PRATT. No, that we attacked the enemy.

Paragraph 32 of the letter of Admiral Sims reads as follows.

32 In spite of the numerous messages sent in April, the only information up to April 27, 1917, was that six destroyers only would be sent. The situation then so very critical that I appealed to the American ambassador in London and sent a most urgent message to the President, and on May 3, 1917, the necessary information was received of the department's intention to send more than six destroyers—that ultimately 36 and two repair ships would be sent.

Paragraph 32. I am not thoroughly familiar with the situation in April, not being in the office in an administrative capacity at that time.

I will here read a statement showing the number of destroyers sent to the first of each month, in Europe, under repair at home and available but being used in home waters. This list does not include 5 old destroyers on the Pacific coast of 450 tons, which were later moved to the Atlantic. These destroyers were old, small and very useful. They were later used to swell our coast defense, relieving better boats to meet the requests from Halifax, and later having been repaired, got as far as the Azores. The destroyers left at home as you will note, did not exceed 9 or 10. They were used to screen the fleet in sea maneuvers, protect transport ships at this end of the voyage until they met the European destroyers. They were used to convoy valuable ships, principally British, to their own ports. Despite the acute situation in British waters, no valuable ship of theirs requested a destroyer escort on approaching our ports. The requests came to us from their Admiralty through their naval representative here.

I desire to submit at this point the following papers:

(E) List of destroyers, showing their duty, availability and location from Jan. 1, 1917, to Dec. 1, 1918.

(E1) Order to destroyer commander.

(F) List of U. S. vessels in commission on the 1st of each month from Apr. 1, 1917, to Nov. 1, 1918, inclusive, operating in European waters.

(G) List of U. S. naval vessels in commission on the 1st of each month from Apr. 1, 1917, to Nov. 1, 1918, inclusive.

(H) Location and availability of submarine chasers.

(H1) List of results in European waters April 6, 1918.

First, there is the following memorandum in regard to destroyers.

First destroyers sailing for Europe (Apr. 24, 1917): *Conyningham*, *Davis*, *McDonough*, *Porter*, *Wadsworth*, and *Wainwright*.

Destroyers sailing from the Philippines (Aug. 1, 1917): *Bainbridge*, *Barry*, *Chawick*, *Dale*, and *Decatur*.

New destroyers were commissioned from May 1, 1917, to January 1, 1918, and sailed as follows: *Manley*, October 15, 1917; *Stockton*, November 26, 1917; *Caldwell*, December 1, 1917; *Isabel* (fast yacht, classed as destroyer), December 28, 1917.

The five destroyers in home waters which were not at navy yards on June 1, 1917, were: *Allen*, *Ammen*, *Henley*, *Shaw*, and *Terry*.

Status of oil-burning destroyers from Jan. 1, 1917, to Jan. 1, 1919.

1 sunk Dec. 6.

have made a distinction between the oil-burning and the coal-burning, because both in fleet operations and in operations requiring quick movement a distinction must be made between the tactical uses of these two. The coal burner makes a good deal of smoke and is easy for a submarine to find on the surface. The oil burner can run smokeless, and is therefore by far the most protective of all destroyers, owing to their sea-keeping qualities; anything less than a 750-ton boat, unless she is perfectly brand-new, is not to be classed with her as a sea-keeping ship.

The CHAIRMAN. Can an oil-burning destroyer make an equally effective smoke screen as a coal-burning destroyer?

Capt. PRATT. Yes; more effective. She has the power to run smokeless, or she can make a screen so dense, as I saw it once when I was with Admiral Sims, from Boston Harbor all the way down to Cape Ann everything was so completely clouded and the smoke was so thick that you could not see the forecastle because of the moisture in the atmosphere with the oil smoke.

Now, here is the status of the coal-burning destroyers:

Status of coal burning destroyers from Jan. 1, 1917, to Jan. 1, 1919.

| Date. | In home waters. | En route to Europe. | In European waters. |

11 sunk Nov. 19.

NOTE.—“Home waters” includes Atlantic coast and Pacific coast and the Philippines. Of these 21 destroyers 5 were 750 tons—*Reid, Smith, Flusser, Lamson, Preston*. The remainder were smaller vessels classed as coast torpedo boats of approximately 400 tons.

We had in home waters on January 1, 1917, 21 destroyers. That includes five of the 750-ton boats, and the other 16 are not classed as destroyers exactly, but I will show you in this book, which I will submit afterwards [indicating], in which I have marked the page, how they come in. They were old 400-type boats. They were scattered all over the world—a few of them were. But of those 21, the five really effective ones were the five 750-ton coal burners.

There has also been given in Capt. Taussig’s report, I think, a statement which may have left some impression as to his failure to have received orders to cooperate fully with the forces on the other side after his arrival. I will submit a copy of his orders, and will read such pertinent extracts as relate to the operations. [Reading]:

ORDERS ISSUED TO COMMANDER, EIGHTH DIVISION, DESTROYER FORCE, APRIL 14, 1917.

(Secret and confidential.)

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, D. C.

To: Commander, Eighth Division, Destroyer Force, Atlantic Fleet, U. S. S. *Wadsworth*, Flagship.

Subject: Protection of commerce near the coasts of Great Britain and Ireland.

1. The British Admiralty have requested the cooperation of a division of American destroyers in the protection of commerce near the coasts of Great Britian and France.

2. Your mission is to assist naval operations of Entente Powers in every way possible.

3. Proceed to Queenstown, Ireland. Report to senior British naval officer present, and thereafter cooperate fully with the British navy. Should it be decided that your force act in cooperation with French naval forces your mission and method of operation under French Admiralty authority remain unchanged.

Route to Queenstown.—Boston to latitude 50 north, longitude 20 west, to arrive at break then to latitude 50 north, longitude 12 west, thence to Queenstown. When in radio communication of the British Naval forces off Ireland, call G CK and

the vice admiral at Queenstown in British general code of your position, and speed. You will be met outside of Queenstown. Facilities will be provided by the British Admiralty. Communicate your orders and operations to Rear Admiral Sims at London and led by such instructions as he may give you. Make no reports of arrival to Department direct.

JOSEPHUS DANIELS.

Will now submit a list of United States naval vessels in commission the first of each month from April 1, 1917, to November 1, inclusive, operating in European waters. This list is as follows [ing]:

United States naval vessels in commission on the first of each month from Apr. 1, 1917, to Nov. 1, 1918, inclusive, operating in European waters.

Senator PITTMAN. I wish you would read again the figures for April and May.

apt. PRATT. There were none on the 1st of April. There were none in European waters in April, 1917. We had not gone to war. Destroyers did not sail until the 24th of April and did not arrive there until the 4th of May.

Senator PITTMAN. I understood you to say there were none in European waters in May.

apt. PRATT. No, sir; on the 1st of May; and on the 1st of June shows what had come over in May. On the 1st of June there were 18 destroyers and 1 auxiliary, making a total of 19.

the CHAIRMAN. When did the 24 arrive on the other side? That one arrived on May 4 and the other 18 arrived when?

apt. PRATT. I have not got that date.

the CHAIRMAN. The latter part of the month?

apt. PRATT. Yes; I have that also. I have it later on in my statement. I have another paper which shows what we had on April 6, 1917, and that is given, and the ships are named with the date of sailing and date of arrival of each. That statement will include those

I would like to submit a list of naval vessels in commission on the first of each month from April 1, 1917, to November 1, 1918, inclusive. This is a list of all naval vessels including those abroad and on this side. Of battleships there were 29.

The CHAIRMAN. Are the battleships there by name?

Capt. PRATT. No; this is just the classes. Admiral McKean has the full list showing the comparative readiness. Admiral McKean is more qualified to give the preparation than I am, as I was merely an operator, taking what was handed to me and then operating. His information is more accurate than mine.

This list is as follows:

List of United States naval vessels in commission on the first of each month from April 1, 1917, to Nov. 1, 1918, inclusive.

November 1, 1918, there were 1,498 ships being operated by the Navy.

I will submit also a list of our submarine chasers. [Reading:]

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, March 18, 1919.

Memorandum for Capt. Pratt:

There were no submarine chasers in European waters in 1917.

Submarine chaser convoys sailing for Europe:

1 14 en route.

Between March and April, 1917, contracts for over 300 110-foot submarine chasers were let. The dates in this table are the dates when they sailed for Europe; and also the number en route or already in Europe.

There were no submarine chasers in European waters in 1917. They were not built; nor did we have any tugs and escort vessels in time to get them over in that year. They had to be built and put into shape.

Senator PITTMAN. The question as to where these were built, etc., probably will be answered by Admiral McKean.

Capt. PRATT. That comes under Admiral McKean, and he knows about when the contracts were let and the way they were built.

I can, of course, give some idea of the efforts we were making to put them in shape, and will state that there was an office under Capt. Tompkins, organized in the office of operations as soon as the submarine chasers began to be available, and they were sent to New London for the crews to train, and to fit them with the sound-detecting devices, which was then done in New London, and for some experimental work in actually operating with our submarines submerged, and to have the personnel in training, in order to fit them as rapidly as possible to project to Europe.

The CHAIRMAN. None of them, however, reached Europe?

Capt. PRATT. None of them reached Europe until 1918. The first one was only completed in September, 1917.

Senator TRAMMELL. I believe you stated there were 135 in Europe on the first of November?

Capt. PRATT. 1918.

Senator TRAMMELL. 1918?

Capt. PRATT. Yes, 1918; and not 1917.

The CHAIRMAN. That was at the end of the war.

Capt. PRATT. I have here also a book of data, which is the last book published, the issue of which went out of date with the beginning of the war because the information therein contained was supposed to be confidential and secret, and we did not wish to keep it up to date after we went into the war. But it gives you, type for type, the vessels that we had in our Navy. It is called "Ships' Data of United States Naval Vessels," published by the bureau of construction and repair. It shows you the name of every ship we had in the Navy on November 1, 1916. Of course, that is what we had when we went into the war. I built anything more, practically

we had not anything more that was new and that might be useful in case anyone wanted to read it, so that I have submitted it here.

I have here also a list of the vessels in European waters April 1918, which gives their date of sailing and date of arrival in Europe. This gives you complete information as to the ships and the dates of sailing and dates of arrival. This list is as follows. [Reading:]

List of vessels in European waters Apr. 6, 1918.

DESTROYERS.

| Grand total..... | | |

se books I have submitted for the reference of the committee marked the places that refer to our smaller submarine and merely submit these in case any questions are to be asked about the subject.

I had difficulty, because in a way the files that I operated during the war have been more or less disrupted since I left, to get historical data. I have not always been able to lay my hands on everything I would like, as I could while we were at sea, in order that the state of personnel preparedness may be determined by the gentlemen of the Senate Naval Committee. I have here the list and directory of January 1, 1917, February 1, 1917, March 1, 1917, April 1, 1917, and May 1, 1917, in which I have pasted little slips which indicate the number of ships on full commission and vessels operating in the reserve due to personnel shortages; so that that gives you the complete story when you get McKean's material report. I leave these books here for your reference.

CHAIRMAN. They are not to go in the record?

PRATT. No, sir. I have prepared a list of destroyers showing complements on board in January, 1917, and also the complement on March 31, 1917. I did that because it would help the committee a great deal in being able to read the summary rather than to go through those five blue books that I submitted and report for themselves, and I therefore, with your permission, propose to submit this paper to go in the record at this point. It will tell you the whole story as far as I know it.

CHAIRMAN. This is as to condition and personnel?

PRATT. No; as to personnel and condition, Admiral McKean should show the full account of personnel. I do not like to go outside my own bailiwick. I could do it from the lists, but I would not should do it.

CHAIRMAN. Very well.

What is referred to is as follows:)

APRIL 19, 1920.

Destroyers, 1917.

A—Active duty. R—Reserve.

Gentlemen, these lists speak for themselves. Of all the submarine types, which are the destroyers, the subchasers, vac gunboats, coast-guard vessels, the destroyer of 750 tons and all is the only real efficient fighter. Of these craft you will note except 9 or 10 were immediately sent over, or docked and put in condition and sent over. The older destroyers of 400 tons, the coast-guard ships with a few exceptions, and the yachts in the Navy (as I want to say about the yachts that there were only three yachts that were ready to go, the *Mayflower*, the *Yankton*, and the *Scorpion* interned in Constantinople; they were the only three yachts that could really cross the ocean); and the yachts that were in the Navy at the beginning of the war, at that time, were of the Spanish vintage, and practically incapable of crossing the Atlantic, a 3,000 mile voyage. The gunboats, except the *Sacramento* and about 10 coast-guard ships, were of the same age or older. They, however, were sent, and the patrol of the coast, as soon as the agreement was made with the British and French admirals on this coast (acting as representatives of their two admiralities) was terminated. All of the subchasers which were sent had to be built. Yachts sent had to be the latest and best types with sufficient radius to cross the Atlantic, they had to be commandeered and fitted after war was declared. Gentlemen, every one of these antisubmarine types except a few of the latest destroyers are not built for cross Atlantic work.

of our destroyers, even, had a short 2,000-mile working radius, stating fuel-oil bases at St. John's Newfoundland, and the to help them across. When you consider the difficulties mounted to get these antisubmarine craft across the Atlantic of them in midwinter, praise and not criticism should be given. No nation in the world has ever done this before, and it speaks of determined efforts made on this side of the water and of the well manning these boats that they ever got there at all. I so in this connection to read a short pertinent extract from the defense plan and to submit it. It will be noted that this was signed by Commander Babcock, the officer who stood closest to Admiral Sims and was perhaps best able to express the opinions of the Admiral at that time.

The plan was worked up in the office of operations when it was first necessary that we might be called upon to avoid a submarine menace on this side.

CHAIRMAN. When was that?

PRATT. The plan is dated February 6, 1918. There was a board to formulate a plan of defense in home waters, composed of the Chief of Naval Operations, and others. I submit this as a whole. It is dated March 19, 1918.

I only read pertinent extracts, and submit the report as a record for the record. [Reading:]

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, February 6, 1918.

Special Board to Formulate a Plan of Defense in Home Waters,
Chief of Naval Operations.

Defense against submarine attack in home waters.

Pursuant to instructions, reference (a), the board convened at 10 a. m., Monday, March 4, 1918.

GENERAL POLICY.

The general policy of the United States is to send the maximum possible force to the theater of war. This policy the board has constantly in mind to the end that there might be no weakening of it. As regards any force still retained or in the future to be held in American waters, which might be suitable abroad, the board has been governed by the consideration of trans-Atlantic transit, the security of which is the chief task of the naval force on America, depends for its success upon a sufficient guard in American waters. The force retained in American waters can not, with military prudence, be reduced below the minimum required for meeting the emergency here being considered. It has devolved upon this board to determine what minimum is; and such determination should be held to against the repeated temptation to send all force abroad, of individuals who have not fully considered the matter as a whole. In the course of our discussions this principle has repeatedly been asserted to and reaffirmed. Emphasis is laid upon it as the basis of any plan for defense against hostile operations near our coast.

POLICY IN THE FACE OF SUBMARINES.

In the event of actual submarine hostilities on this coast, first disclosed perhaps by the sinking of a steamer by a mine, what shall be the policy as to shipping? Shall we continue with the least possible interruptions, or shall it be held in port until the submarines shall have been located and destroyed? The latter course would render at once to the enemy a large measure of success in his purpose.

9. It is recognized that to keep on sending out shipping may involve the loss of some vessels soon after departure from our ports. We are, notwithstanding, convinced that this course should be pursued. To hold vessels in port until all is over will encourage the enemy both near and abroad; it will help prolong his period of activity on our coast and will demoralize and confuse our arrangements on shore more than would the loss of one or two vessels. Abroad, the suspension of armaments for several weeks would have an effect serious beyond calculation. On the other hand, to continue with our sailings boldly, unshaken in our general offensive policy, would hearten our own people while giving no ground to the enemy submarine. The escort with our convoys would force the submarines to take a chance for every sinking they might attempt. From the first disclosure of their presence their accomplishing anything in our waters should become increasingly difficult, and this can only come about by our taking the strong line of action.

10. On this point it is therefore the decision of the board that we should keep sending shipping out with the least possible delay, at the same time taking all possible offensive measures to remove the danger.

* * * * *

37. The kind of force that should accompany convoys has already been stated. In addition, it is the board's conclusion (bb) that, in addition to harbor and inshore vessels, there should be a force of destroyers and of submarines ready to act on information of hostile submarines near our coast. (cc) That the strength of these should be, in the first naval district, 2 destroyers, 1 submarine; third naval district, 4 destroyers, 5 submarines; fifth naval district, 4 destroyers, 5 submarines.

* * * * *

42. The board concluded, therefore, (dd) that new destroyers should remain on our coast for one month shakedown after commissioning, to be available for service in the event of the appearance here of hostile submarines; but that not more than nine at one time need be so detained, if prepared earlier to sail for distant service.

That is signed by the members of the board, among whom Commander J. V. Babcock, who was at that time acting as liaison officer between ourselves and Admiral Sims.

That was approved by Admiral Benson.

(The document above referred to is here printed in full in the record, as follows:)

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, February 6, 1918

From: A special board to formulate a plan of defense in home waters.

To: Chief of Naval Operations.

Subject: Defense against submarine attack in home waters

Reference: (a) Opnav letter No. — of February 1, 1918, convening board.

1. Pursuant to instructions, reference (a), the board convened at 10 a. m. Monday, February 4, 1918, all members present except Lieut. Commander Foy, who was absent beginning with the afternoon session. As a result of its deliberations, the board submits the following report:

BASIS OF DISCUSSION.

2. The Germans have completed a number of cruising submarines of large range and large capacity, and these may be used on our coast, with a view to divert some of our military activity away from European waters. The constant increase of submarine forces abroad may compel an enemy effort to cause such a diversion, and the comparative openness of American waters offers a good field for submarine activities. Information is indefinite as to the number of enemy submarines possibly intended for American waters, but an approximation is sufficient for discussion. The salient features of the situation are therefore taken to be as follows:

GENERAL SITUATION.

3. A division of 4 submarine cruisers, each armed with 6-inch guns, 36 mines, 16 torpedoes, and capable of at least one month's activity on our coast, may appear in American waters without warning.

4. Their aim will be to destroy shipping; interrupt the transport of troops and supplies to Europe; interfere with our coastwise shipping; by these means causing

to send some of our naval force for defense of home waters. Bombardment of towns may also be done, with a view to heighten popular demand for action and thereby embarrass the naval administration. We will employ mines, guns, torpedoes, and bombs. Their principal activities are expected to be directed against the main shipping centers; Halifax, New Hampton Roads, and Florida Straits. At the same time, by activity of some several localities so separated as to suggest the presence of a large force, they seek to produce a maximum popular disturbance early in their campaign.

GENERAL POLICY.

The general policy of the United States is to send the maximum possible force for offensive operations in the active theater of war. This policy the board keeps constantly in mind, to the end that there might be no weakening of it. With regard to any force still retained or in the future to be held in American waters which might be suitable abroad, the board has been governed by the consideration of trans-Atlantic transit, the security of which is the chief task of the naval force on America, depends for its success upon a sufficient guard in American as in European waters. The force retained in American waters can not with military prudence be reduced below the minimum required for meeting any emergency here being considered. It has devolved upon this board to determine what minimum is; and such determination should be held to against the repeated suggestion to send all force abroad of individuals who have not fully considered the matter as a whole. In the course of our discussions this principle had repeatedly been asserted to and reaffirmed. Emphasis is laid upon it as the basis of any plan for defense against hostile operations near our coast.

POLICY IN THE FACE OF SUBMARINES.

In the event of actual submarine hostilities on this coast first disclosed perhaps by the sinking of a steamer by a mine, what shall be the policy as to shipping? Shall we proceed with the least possible interruptions, or shall it be held in port until the submarine shall have been located and destroyed? The latter course would surrender at once to the enemy a large measure of success in his purpose. It is recognized that to keep on sending out shipping may involve the loss of some vessels after departure from our ports we are, notwithstanding, convinced that this should be pursued. To hold vessels in port until all is clear will encourage the enemy both near and abroad; it will help prolong his period of activity on our coast; it will demoralize and confuse our arrangements on shore far more than would the loss of two vessels. Abroad, the suspension of arrivals for several weeks would have a serious effect beyond calculation. On the other hand, to continue with our ordinary policy, unshaken in our general offensive policy, would hearten our own people giving no ground to the enemy submarine. The escort with our convoys will give the submarines to take a chance for every sinking they might attempt. From the first disclosure of their presence, their accomplishing anything in our waters becomes increasingly difficult, and this can only come about by our taking the initiative of action. At this point it is therefore the decision of the board that we should keep on shipping out with the least possible delay; at the same time taking all possible measures to remove the danger. The measures necessary to put into effect the foregoing policy divide under two heads, control of shipping and military offensive.

CONTROL OF SHIPPING.

After discussing the several questions involved successively, the board came to the following conclusions:
 That where mines have appeared, outbound shipping should be routed clear of them, through a swept channel.
 That shipping should use swept channels as soon after the sweeping as circumstances permit.
 That coastwise shipping should proceed at night and independently. (See change.)
 That ocean shipping should proceed in convoys.
 That the convoys should be as large as the available escort permit.
 That convoys should be preceded to the 50-fathom curve by four submarine equipped with listening attachment. (See change.)

(g) That air scouts should patrol the convoy's intended course out to the curve from the convoy's departure until it clears 50 fathoms or darker (See change.)

(h) That convoys should be accompanied by an ocean escort, by an escort to the 50-fathom curve, and by one or more escorting submarines (See change.)

(i) That the ocean escort should be a cruiser, or a converted merchant naval commission, armed with guns of 5-inch or larger caliber.

(j) That the antisubmarine escort should consist of submarine chasers, depth bombs and guns up to 3-inch caliber. (See change.)

(k) That the antisubmarine escort for a convoy should be the number approved instructions in force at the time.

(l) That the escorting submarines with a convoy should precede it, and to keep lookout for enemy submarines and warn and divert the convoy if an enemy submarine can sight it. (Omit, see changes.)

13. Considering a suggestion that interference with shipping would be difficult by sending convoys out of more ports than are so used at present, concluded that available escort vessels were too few, that land transports were disarranged, and that harbor facilities would be taxed too much beyond capacity to offer any success for such a measure. Accordingly,

(m) The dispatch of convoys should be limited to New York and Hampton Roads as at present.

14. The foregoing applies mainly to the area between Nantucket Shoals and Hatteras. Shipping out of the Gulf, including the important fuel oil tankers as yet been convoyed and escort force is not available to establish a service.

15. A division of submarines and an aviation station are located at Key West. Dependence must be placed upon these and upon local and passing transatlantic coastwise lookout service for information of hostile submarines in the vicinity. In such event shipping out of the Gulf of Mexico should be routed south of the Gulf. (See change.)

16. In the event of submarines operating against shipping coming from the Gulf, shipping may be routed via Cape Horn; but action as to this would be left to the particulars of the situation at the time for any more definite decision on this board. (Omit, see changes.)

17. *Incoming shipping.*—In order to route incoming shipping clear of dangers, it is the consensus of the board that the best means would be to route incoming shipping clear of dangers. This would insure the correct receipt of and compliance with routing instructions. Not enough cruisers being available to convoy return shipping, however, it is the choice but that—

(n) Return shipping to the United States must be independent of convoys (See change.)

18. Considering the great extent of coastal waters inside the 50-fathom curve, it is at best possible only to keep one avenue of approach to New York and Hampton Roads sufficiently swept for a practical degree of safety from enemy submarines. The sweeping task is lessened by the fact that only a small number of mines can be covered by submarines. Judging by the latest experience abroad, these mines are laid in small groups in several widely separated locations. There being only a few sweepers available, they can be employed to the best advantage by sweeping the route clear of mines rather than by attempting to keep several fixed routes clear. In searching formation sweepers can cover more ground than in a sweeping line. The board concludes, therefore—

(o) That incoming shipping should be routed into port through approaches that have been found by searching or sweeping to be safe.

19. *Secrecy in routing.*—To the end that vessels may be warned daily of the presence of submarines and mines and receive directions for their movements—

(p) Return shipping to the United States should be controlled by radio from the United States.

20. To provide for the necessary secrecy of such radio control.

(q) Each belligerent vessel should carry a commissioned communication officer of her own or of United States nationality. Such officer would be in charge of the vessel's communication and would decipher code messages and transmit them to the master of the vessel. He would have no authority over nor responsibility for the vessel. He must have seagoing experience, but must be trustworthy and of sufficient education to supply these communication officers, our trained personnel need not be trained for this duty.

21. The foregoing provision must be undertaken immediately to be of use when wanted; but wholly apart from its value in emergency, the board

deep-mine fields contributing materially to the destruction of enemy submarines, remote, on account also of the small number of submarines that may be expected to operate. The board therefore concludes that—

(t) Unless hostile activities on our coast be prolonged beyond control by other measures, no deep-mine fields should be planted; but

(u) That naval districts be prepared to plant mines and that steps be taken to make mines available for planting a deep barrier across the approaches to New York Harbor and Hampton Roads; and further (see change),

(v) That districts should be prepared to announce fictitious mine fields in the event of the emergency contemplated actually arising, and to route shipping accordingly.

30. As a whole, the passive defenses of the first, second, third, and fifth districts are deemed sufficient for the defense of the principal harbors in those districts.

ACTIVE OFFENSIVE.

31. The purpose of measures of active offense is to locate and destroy the submarines.

32. The principal operations of these submarines must be conducted in the offing of New York, off the capes of the Chesapeake, and in the Florida Straits and Yucatan Channel. In order to continue their operations beyond their self-contained capacity, the enemy submarines must replenish from some near-by base or by some means of supply from our coast or some neutral source.

33. *Information service.*—To locate the submarines, we have an organized lookout service in operation along the coasts in the several naval districts, and also a secret service of sufficiently wide extent and connections. These should be warned to be on the lookout for evidences of any use of our coasts and of any support to enemy submarines from on or near our coast.

34. The same applies to the possibility of the enemy's use of a base in the Bahamas. Connection of our intelligence service with that of the British in the Bahama Islands should be sufficient provision to secure timely information. In this connection it is stated by the commander of squadron 2, Cruiser Force, that a reconnoissance of the Bahama Islands shows little suitability of that region for use as a submarine base.

35. *Air patrol.*—The naval air service, in addition to assisting the escort of convoys, may contribute materially to the locating of submarines by air scouting off our coast, including the use of kites and dirigibles, especially between Nantucket Shoals and Cape Hatteras. It is assumed that this may and will be done, should the contemplated emergency arise.

36. *Active forces.*—The situation has not yet sufficiently developed to enable the board to do more than outline the offensive action that may be taken. The conclusion was reached

(aa) That provision should now be made for forces to be available where likely to be needed, to detect and locate enemy submarines, to act upon information of their whereabouts, and to be capable of attacking a submarine if encountered.

37. The kind of force that should accompany convoys has already been stated. In addition, it is the board's conclusion

(bb) That, in addition to harbor and inshore vessels, there should be a force of destroyers and of submarines ready to act upon information of hostile submarines near our coast.

(cc) That the strength of these should be, in the first naval district, 2 destroyers, 1 submarine; third naval district, 4 destroyers, 5 submarines; fifth naval district 4 destroyers, 5 submarines.

38. The possibility of there being more submarines capable of service, at the New London and other bases, and of more destroyers being under shake down, after the building program shall have begun to yield more frequent deliveries, was taken into account; as also the submarines at Key West and Panama and the vessels already in the several districts. The forces named in paragraph (cc) above are the minimum increase needed.

CONTROL OF ACTIVE FORCES.

39. The lookout service and reports of coastwise and other passing traffic first come under the cognizance of the naval districts, and these districts will have at disposal the forces intended to act according to the situation that may arise. The success of measures against submarines in the majority of cases will probably depend on the celerity with which the forces act on information received. This indicates that their action and control should be in the hands of the respective naval district commands, and the board so recommends.

40. *Providing the necessary forces.*—Adverting to the policy laid down in paragraph 7 of the board, examining the sources that could be drawn upon for the force specified in paragraph (cc), concluded that the best practical plan was to utilize new destroyers and new submarines during the shake-down period, before departure for European waters.

41. Considering first the destroyers, this would involve a delay at first, but this is unavoidable if adequate provision is to be made for the contingency under consideration. Besides the delay is not so long as at first apparent. Not less than two weeks is the probable minimum required by the average new destroyer for preliminary shake-down. To this some few days more may be needed for new fittings constantly being added, which would be installed on board on this side instead of abroad. During the time so spent the destroyer would be available for emergency if here, but if abroad it would not be operating, so no operating time is lost on this account. Further, by a somewhat longer shake-down time on our coast, together with a quick run across, instead of a slow passage for shake-down en route, the ultimate date of beginning service in the war zone would be little affected. The same applies to the submarines.

42. The board concluded, therefore—

ii. That new destroyers should remain on our coast for one month shake-down after commissioning, to be available for service in the event of the appearance here of hostile submarines, but that not more than nine at one time need be so detained, if prepared earlier to sail for distant service.

iii. That the nine destroyers so detained shall be stationed, one in the first, and two each in the third and fifth naval districts, the commandants of which shall be instructed to use them as necessary in the event of hostile submarines appearing on this coast; otherwise not to employ them, but instead to allow them all possible freedom in their training for active service.

iv. That to provide the necessary submarines for the emergency service contemplated, new submarines should have a shake-down period of two months; their training course not to be interrupted, but to continue in its normal course from its usual base; but, upon the appearance of hostile submarines, one division to be escorted to New York and one division to Hampton Roads; further, while based on these places, to continue their training to such extent as the situation may permit; the respective naval district commandants to observe the same attitude as towards destroyers, stated in paragraph (ee).

43. Still other forces are required, which with available sources may be stated briefly:

gg. Participation by any force from the Atlantic Fleet, other than the cruiser force now employed in convoy duty, is not counted upon.

hh. A force of 30 submarine chasers each, based on New York and on Hampton Roads, will be needed for convoy escort and listening service. To provide these, the earliest deliveries intended for other districts should be diverted to the third and fifth districts until the necessary total numbers are present in these districts.

ii. One destroyer and one submarine permanently employed in experimentation are counted upon, with one new destroyer under paragraphs (dd) and (ee), to make up the force for the first naval district.

In order to accomplish the sweeping task without delaying shipping, in or out-bound, there must be based at New York and Hampton Roads, sweepers enough to keep in service two sweeping groups of three pairs each. For this there must be 18 or more mine sweepers at each place named. As neither the third district nor the fifth has this number, the board recommends that sweepers from the first and second districts be added to those of the third district when the occasion arises, and similarly those from the fourth district to go to the fifth district.

kk. For the air service to be performed, it is estimated that a force of 40 airplanes will be needed at Rockaway Inlet and at Hampton Roads in order to insure 16 planes being serviceable for escort duty; and this number should be made available. (See change.)

44. *Weakness of district vessels.*—The armament of such vessels of the naval districts as are seaworthy is too light for engaging a single submarine with success, except by surprise. It is therefore recommended—

ll. That in view of the possible appearance of submarines armed with 5-inch or 6-inch guns, the armament of district vessels be replaced by larger calibers as soon as practicable, but not to the deprivation of suitable armament for vessels navigating the war zone.

45. *Aids to navigation.*—In order to increase the navigating difficulties of submarines, especially in fog and darkness, and also to prevent the converging of shipping at a point favorable for submarines to operate, the board recommends—

(mm) That immediate steps be taken to install on board all outside lightships on the Atlantic coast radio and listening equipment.

(nn) And that, upon the appearance of a hostile submarine in American waters, all submarine signal bells be stopped, the bells and whistles on outside buoys silenced and Nantucket Shoal lightship be withdrawn. (See change; see additions (oo) and (pp).)

46. The board has included in this report only such detail as has seemed necessary to make its recommendations clear, to show the extent to which existing dispositions have been taken into account, to make a decision where there has been or may be doubt or wide difference of opinion, and especially to strengthen the statement as to the minimum of increase in force necessary to retain on this side. In view of existing machinery for executing plans, it seems inadvisable to go further into details.

M. Johnston, rear admiral, United States Navy; Philip Andrews, captain, United States Navy; S. S. Robison, captain, United States Navy; L. R. de Steiguer, captain, United States Navy; R. R. Belknap, captain, United States Navy; I. McNamee, captain, United States Navy; J. R. Y. Blakely, captain, United States Navy; J. V. Fullenwider, commander, United States Navy; J. V. Babcock, commander, United States Navy; E. J. Foy, lieutenant commander, United States Navy.

Approved as changed by modifications, etc., appended.

W. S. BENSON.

[Confidential.]

MARCH 19, 1918.

From: Chief of Naval Operations.

To: Commandants, first, second, third, fourth, fifth, sixth, seventh, eighth, and fifteenth naval districts.

Subject: Defense in home waters

References: (a) Report of Special Board February 6, 1918. (b) Approval with modification by Chief of Naval Operations March 6, 1918. (c) Memorandum for all divisions of Office Chief of Naval Operations March 13.

1. Your attention is invited particularly to the analysis of the distribution of the responsibility among the several divisions of the Offices of Operations in working out the plans of defense set up in the report and approval subject to above references (a) and (b).

2. The commandants of the several districts will perfect provision for the defense of the several districts in conformity with these plans. Concentration of all mine sweeping and of more or less of the mine laying groups from other districts particularly the first, second, and fourth districts, in the third and fifth districts is indicated and in laying out the district defenses the withdrawal from district forces of such units must be compensated for. The policy indicated in the report is to mine sweep the approaches to the harbors of New York and Norfolk only and in view of this, the difficulty of making such compensation will not be great inasmuch as the service of mine sweeping will not be required elsewhere.

This should not result, however, in the curtailment of plans for training district forces in these activities.

3. Attention is further invited to the requirements indicated in respect to torpedo boats and submarine chaser boats for use in defensive and convoy work.

4. The responsibility for working out these defensive plans and maintaining at all times the requisite force and material rests as to each district with the district commandant. Commandants will report promptly and in sufficient detail when perfected and dispositions established for maintaining these defense plans, and will take necessary steps to secure any equipment lacking to this end and report fully in respect thereto.

5. This letter and the references cited above and the subject matter is highly confidential in character and must be so regarded by all having knowledge of it.

H. OSTERHAUS.

NAVY DEPARTMENT,
Washington, March 13, 1918.

Memorandum for all divisions of Office of Naval Operations.

Subject: Execution of a plan for defense against submarine attack in home waters.

1. In accordance with the attached plan and approved modifications, the following parts thereof are assigned to the divisions of this office for information and action. Where a part has been assigned to more than one division the officers in charge will cooperate in its execution in accordance with the duties of their respective divisions.

2. Provisions of the plan that require the action of any bureau will be prepared by the head of the division concerned and transmitted to the bureau after signature by the Chief of Naval Operations.

Communications Division.—Assistant for operations: Paragraphs 6, 7, 10, and 45. Over-sea transportation: Paragraphs 12 (c), (d), (e); 13 (m), 17 (n); 19 (p); and 22. Ship movements: Paragraphs 12 (i); 19 (p); 36 (aa); 37 (bb), (cc); 39; 42 (dd), (ff); 43 (gg), (hh), (jj).

Submarine detection. Paragraphs 12 (j); 36 (aa); 37 (bb), (cc); 42 (dd), (ee), (ff); 43 (ii), (jj); and 45 (mm), (nn), (pp).

Material Division.—Paragraphs 12 (i), (j); 26 (r); 27 (s); 29 (t), (u); 36 (aa); 43 (ii), (jj); 44 (ll); 45 (mm), (pp).

Intelligence Division.—Paragraphs 32, 33, and 34.

Communications Division.—Paragraph 19 (p); 20 (q); and 21.

Naval Districts Division.—Paragraphs 12 (a), (b), (c), (f), (g), (h), (j), (k); 15; 18 (o), (p); 26 (r); 27 (s); 29 (t), (u), (v), 32; 33; 34; 35; 37 (bb), (cc); 39; 42 (dd), (ee), (ff); 43 (ii), (jj), (kk), 44 (ll); 45 (mm), (nn), (oo), (pp).

Air Division.—Paragraphs 12 (g); 15; 35; 36 (aa); and 43 (kk).

W. S. BENSON.

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, March 6, 1918.

The foregoing plan, "Defense against submarine attack in home waters," with the following alterations, modifications, or changes is approved. Steps will be taken immediately to put it into effect.

MODIFICATION AND CHANGES OR ALTERATIONS—OUTBOUND SHIPPING.

Paragraph 12 (c).—That the best practice is to have the coastwise shipping proceed by day, hugging the shore and keeping within the 5-fathom curve or as near it as practicable. Also, since it is the policy of the shipping committees charged with such work, to allocate the smallest and least valuable ships to the coasting trade, it, as a matter of expediency, should be the policy to protect said shipping by the means within the capacity of the naval districts through which the coastwise shipping passes, rather than to attempt to divert guns from ships in the trans-Atlantic trade, or to allocate cruisers for the protection of our coastwise trade, except in such cases where the districts could not afford protection, or the guns were readily available.

That if it were found expedient to route coastwise ships at night, that they should sail independently, being routed with due regard to the warnings received of the location of enemy submarines.

Paragraph 12 (f).—Change to read: "That convoys should be preceded to the 50-fathom curve or as far beyond as necessary by four submarine chasers equipped with listening attachments."

Paragraph 12 (g).—Change to read: "That air scouts should patrol the convoys intended course out at least to the 50-fathom curve and as far beyond as circumstances permit, or until darkness comes on."

Paragraph 12 (h).—Omit the words "and by one or more escorting submarines for lookout." It is the policy to use our submarines offensively against hostile submarines, and their movements are influenced by the movements of hostile submarines, or by the movements of our convoys.

Paragraph 12 (j).—Add at the end of paragraph: "and also of destroyers if advisable."

Paragraph 12 (l).—Omit entirely.

Paragraph 15.—Last two lines. Change to read: "Shipping out of the Gulf of Mexico should be routed north or south of Cuba as circumstances existing at the time render most expedient."

Paragraph 16. Held to be not sound as the delay thus caused to shipping practically reduces its efficiency to a lower limit than the actual submarine sinkings could impose.

Paragraph 17 (n). Add the words "until such time as convoys can be established."

Paragraph 27 (s). That in view of the slight advantages to be derived as compared to the inordinate risk to shipping, the subsurface mine will not be used offensively against hostile submarines. That it is legitimate to use it defensively, but that such use should be confined to the purpose of barring entrance and exit to our principal shipping ports and confined to the lowest limits compatible with a fair degree of safety. That even when a defensive mine field is laid, a clear and ample passage must be left for the transit of shipping, and this passage must under no circumstances be mined but be patrolled and protected by other means. That all mines upon being detached from their moorings must become innocuous. That the three places to be considered now as coming within the scope of defensive mining are New York, capes of the Chesapeake, and east entrance to Long Island Sound.

Paragraph 29 (u). After the words Hampton Roads add: "But that owing to the great demand for mines abroad this step be not considered now."

Paragraph 43 (*kk*). Read that a force consisting of at least one squadron of 20 air planes will be needed at each station, Rockaway Inlet and Hampton Roads, and that this number should be made available as soon as practicable, not to interfere with the European program.

Paragraph 45 (*nn*). Omit the words "and Nantucket Shoal Lightship be withdrawn."

Paragraph 45. Add new paragraph: "(oo) Be prepared upon special order of the Navy Department to withdraw all light vessels on the Atlantic Coast, but this will be done only when the necessity is strongly apparent."

Paragraph 45. Add new paragraph "(pp) Establish listening stations at the entrances to Chesapeake Bay, New York, and the east end of Long Island Sound. If these stations prove effective and are needed, to extend the system to other important localities."

W. S. BENSON.

During the time from April to July the organization for handling of communications to and fro between Admiral Sims and ourselves was cumbersome and, in my opinion, not efficient.

Just as a side light, I will say about that cablegram for Admiral Sims that went to Petrograd, I think the trouble was we had to send our cables from Operations to the Office of Intelligence, and it was afterwards sent by them to the British Embassy for coding, and from the British embassy it was sent abroad, and it was there that the mistake of sending it to Petrograd took place, I think.

In April, and until the communication system was reorganized directly under the office of operations, in the early summer of 1917, most of our cables came through the Office of Naval Intelligence. The system after reorganization became very efficient. It was used by the State Department during the peace conference.

Paragraphs 33 and 34 of Admiral Sims's letter are as follows:

33. Most earnest requests were made for tugs because of the urgent need for them in the submarine zone. These requests fully explained how many torpedoed ships could have been beached and salvaged if these tugs had been available. Experience has shown that such vessels could be repaired and put in service again in a short time—a very short time compared to that required to build new ships—thus resulting in a great saving of tonnage.

34. A year after we entered the war but four tugs had been sent, and two of these were specifically allocated to Italy by the department. Nine more were eventually sent at various times, but none before April 23, 1918.

Paragraphs 33 and 34. This is true. The department was having its own difficulties in getting tugs. There was a tremendous demand for tugs on our own coast to assist our transports, handle coal, and for the many purposes connected with our own logistic situation at home. The principal duty of our naval establishment as a whole may be summed up in Army terms, "the preservation of the line of supply," and by that is meant the line of supply both for material and for troops. The center of all these efforts originated at home. It was therefore more important for us to use those facilities which helped build up and sustain our vast system of reserves affecting the Army, Navy, and allied civil industries in this way than it was to send them abroad.

To further increase economy of effort the tug facilities in each of our two great ports of embarkation were pooled. Apart from the above needs and the strictly naval needs of mine sweeping, and of bringing in disabled shipping on our own coast, the policy was to fit out tugs for the service abroad. I wish distinctly to point out the difference between tugs and other naval antisubmarine craft. The destroyers, chasers, yachts, and gun boats were fighters, and their

place was abroad, where the fighting was. The rôle of the tug is, however, first commercial, and its location is properly at the center of commercial activity, that is here at home. Its second rôle was that of the fighter. When our war reserve needs could be met, and long before that time even, the preparation of tugs which could not be spared here was begun. The above conceptions naturally influenced the flow of tugs abroad. So great was the demand for this type that both the Navy and the Shipping Board had to start building these craft immediately. Had the transport service stopped, and the coal situation become more acute than it was, then the whole service of supply in the rear would have been paralyzed. The Army can appreciate what this means. The Army itself was in the market for tugs. Those we obtained were, for the most part, harbor tugs which could not cross the ocean. All that we did get had to be overhauled and repaired. This took time. The Salvage Division was formed to assist in effecting the work the admiral mentioned, but this took time. The first two tugs ready were sent to Italy, where they were badly needed. Italy at that time had received less than any of the other Allies, and the pressure brought to bear to send them there was great. It is a matter of judgment whether it was wiser to send these two tugs to England or to Italy, where there were very limited war transportation facilities. The department decided in favor of Italy.

There is herewith submitted a list of the seagoing tugs available for crossing the Atlantic.

When you come to examine the great numbers of tugs on our coast you will find them essentially harbor tugs. They can not cross the Atlantic. We lost several tugs at sea in the war.

The list of tugs referred to is as follows:)

| Number of seagoing tugs in Euro- pean waters: | | | | Number of seagoing tugs in home waters: | | | |

Paragraph 35 of Admiral Sims's letter is as follows:

35. The department caused serious embarrassment and delays in putting into effect the convoy system, which was the most important of all the measures used in defeating the submarine war against allied shipping.

Paragraph 35. I was not Assistant Chief of Naval Operations at the time when Admiral Sims first brought this subject up, but I remember that the plan was at first looked at with disfavor. There was much to say on both sides, and some British officers on this side had doubts as to its success. It was by no means a proved project at this time, though it later proved to be a success. Our first troop convoy went out June 14, guarded by destroyers, escorting our first 14,000 troops to France. It was always within the province of the British to establish their own convoy system and to prove its worth. On date July 5, 1917, we accepted the convoy system in toto, and after that used every available ship we had for this purpose excepting the battleships which were not so used until September 9, 1918, and ships were allotted to our own and to British convoy impartially, always excepting the primary duty of guarding our own troop convoys, which was one of the, if not the major, sea operations engaged in by our naval forces during the war.

While we are being criticized for not agreeing to convoy immediately, there was a similar dissension of opinion among some of the British authorities in Queenstown. Our destroyer forces there were working on the British patrol system when they first went over, this being the plan in vogue at that time, and they continued under that system for some time. This system was later admitted to be inefficient.

This subject of convoy will be discussed more at length later when it comes to a discussion of operating plans; that is, plans which have been commented upon in the statement of Admiral Sims.

I likewise submit the cable in which we accepted the convoy in toto. [Reading:]

To O. N. I.:

Please send the following message to Vice Admiral Sims through British Admiralty—
Secret:

"Sims. Replying your 72. Department agrees to scheme or convoy outlined by Admiralty. Has designated eight ships for work, *Denver* class; steaming radius, average conditions, 4,500 miles. Three can be available New York July 8, four more available about July 10. At 10 knots can steam to longitude 20 and return to base without refueling."

Paragraphs 36 and 37 of Admiral Sims's letter are as follows:

36. The department was repeatedly assured that the Allies at all times had remarkably accurate information as to the movement of submarines and that it was practically certain that they could not reach our coast, or even leave European waters, without advance information being supplied. Subsequent events proved this assurance to be correct.

37. No submarine visited our coast until May 1918, and the department was in all cases informed when they started across, and often as to their exact destination, where they were to lay mines, etc.

I wish to invite your attention to the fact that in sections 36 and 37 the impression is conveyed that we were informed at all times as to the movement of submarines and that they could not come over without our being informed, in 1917, as well as 1918, when the submarine did come across. This is correct, but requires further explanation. In 1918 the situation was exactly as Admiral Sims states. When the first German submarine arrived about the 1st of June, 1918, it arrived on schedule, and we had been expecting it. In 1917, however, the situation was somewhat different, especially in the first few months of the war.

In all of the letters about that time from the Admiral his main anxiety was lest we become over anxious for the safety of our coast and thus hold back the craft which ought to go abroad. He explained at length how profitable it would be if the entire submarine campaign could be transferred to our coast. This had been accepted by us before he even broached the subject, as sound military doctrine. And we also knew that large numbers could not cross, even if the Germans wanted to send them. Therefore we had, of our own accord, fortified by his assurances, planned our efforts so that nothing should interfere with our major mission of getting all available antisubmarine craft across the Atlantic, except the barest minimum compatible with common sense, even though in 1917 he could not and did not give us the assurances he did in 1918. It is a fairly conclusive proof of our steadfastness in adhering to the doctrine above stated, that when the submarines did strike our coast, no panic was created and the plans for getting troops across went on just as quietly as though nothing had happened. Neither did we hold back our destroyers in any appreciable numbers, except that it was necessary to double our guards sailing with the troop convoys, particularly as we were sailing many ships from both New York and Hampton Roads, frequently forming junctions at sea, and it was considered good judgment to give them an offing beyond the range of submarine activities. No absolute guaranty could be given that the submarine got clear of European waters and ceased firing.

less, nevertheless that did not worry us; we are probably judges of our own frame of mind.

In this connection it might be well to explain that by agreement entered into with the Admiralty, we were responsible for the seas west of longitude 30, and the British forces and forces under Admiral Sims were responsible east of longitude 30. This did not prevent us from making any pertinent suggestions concerning waters outside our own particular jurisdiction; neither did it preclude the Admiralty nor Admiral Sims from making any suggestions they chose concerning our waters. We had no objection to receiving any or all suggestions that might be offered, and the Admiralty, while they may have been apparently felt no resentment. Admiral Sims seems to be the one of the trio who had any feeling in the matter, and this is difficult to understand, as he through his close association with the Admiralty and the department was always in close touch, and his judgments and opinions were given paramount weight. This feeling of dissatisfaction appears to me to be of somewhat recent origin. I did not note it during the progress of the war, though I was in close touch with Admiral Sims. So thoroughly did we have the matter in hand after we had reorganized the service in the summer of 1917, that the matter of long messages to and from was a question of very few hours indeed.

Paragraph 38 of Admiral Sims's letter is as follows:

38. My dispatches show that with all possible emphasis I tried to induce the department to view the campaign as a whole; to consider our naval force as a relatively small item of an allied naval team; that our mission was the protection of all allied lines of communication, and not the United States lines of communication alone; that, particularly in the early part of our campaign, the strictly United States lines of communication, as compared to allied lines, were inconsiderable and it was quite possible to give our relatively small commerce quite superior protection at the expense of losing the war by denying essential protection to the vast allied commerce upon which the success of our common cause chiefly depended.

Paragraph 38. This statement is correct. It is also true that this point of view was accepted by the department or, speaking more specifically, by the Office of Operations, which is that office of the department dealing in policy, plans, strategy, and the movement of ships. We had no commercial convoys of our own to protect in 1918, when for the service of our Army in France, a convoy system was established to French bay ports. We did, however, from the beginning, assume that our primary duty in convoy matters was to protect our own troop transports. After that primary duty was performed, our second task was to protect our own supply lines to France when they were organized. Subject only to these restrictions, our men-of-war were available to guard any convoy and commercial ships sailed in any convoy. Admiral Sims was conversant with this policy. The plan of commercial convoy we accepted from the Admiralty, July 5, 1917. In 1918, a British officer from the Admiralty was sent to Washington to assist and cooperate in our convoy plans. The plans and routings for our troop convoys were handled entirely by our own forces. The troop convoy plans prepared by Admiral Sims, were accepted, but where one end of the route rested in Europe under Admiral Sims, and one in the United States under Admiral Gleaves, the Office of Operations acted as the coordinating agent between the two individual commands. In the first troop convoy of June 14, the plan for which (

States, none yet having been sent us by Admiral Sims, or at it having been received yet, was not an unqualified success, it was a waste of effort, for the protecting force of destroyers. ops were sent over safely, but the measures which had to be o guard them were not economical. This was the subject of n by Admiral Sims. His suggestions were immediately d, and his plan, which we received after the first troop convoy was adopted for other troop convoys.

less, nevertheless that did not worry us; we are probably the best judges of our own frame of mind.

In this connection it might be well to explain that by agreement entered into with the Admiralty, we were responsible for the safety of the seas west of longitude 30, and the British forces and our forces under Admiral Sims were responsible east of longitude 30. This did not prevent us from making any pertinent suggestions we chose concerning waters outside our own particular jurisdiction; neither did it preclude the Admiralty nor Admiral Sims from making any suggestions they chose concerning our waters. We certainly had no objection to receiving any or all suggestions that might be offered, and the Admiralty, while they may have been amused, apparently felt no resentment. Admiral Sims seems to be the only one of the trio who had any feeling in the matter, and this is difficult to understand, as he through his close association with both the Admiralty and the department was always in close touch, and his judgments and opinions were given paramount weight. This sense of dissatisfaction appears to me to be of somewhat recent origin, for I did not note it during the progress of the war, though I was in close touch with Admiral Sims. So thoroughly did we have the radio and cable situation in hand after we had reorganized the service in the summer of 1917, that the matter of long messages to and fro was only a question of very few hours indeed.

Paragraph 38 of Admiral Sims's letter is as follows:

38. My dispatches show that with all possible emphasis I tried to induce the department to view the campaign as a whole; to consider our naval force as but one relatively small item of an allied naval team; that our mission was the protection of all allied lines of communication, and not the United States lines of communication alone; that, particularly in the early part of our campaign, the strictly United States lines of communication, as compared to allied lines, were inconsiderable; and that it was quite possible to give our relatively small commerce quite superior protection at the expense of losing the war by denying essential protection to the vastly greater allied commerce upon which the success of our common cause chiefly depended.

Paragraph 38. This statement is correct. It is also true that this point of view was accepted by the department or, speaking more specifically, by the Office of Operations, which is that office of the department dealing in policy, plans, strategy, and the movement of ships. We had no commercial convoys of our own to protect, except in 1918, when for the service of our Army in France, a convoy route was established to French bay ports. We did, however, from the beginning, assume that our primary duty in convoy matters was to protect our own troop transports. After that primary duty was performed, our second task was to protect our own supply lines to France when they were organized. Subject only to these restrictions, our men-of-war were available to guard any convoy and our commercial ships sailed in any convoy. Admiral Sims was conversant with this policy. The plan of commercial convoy we accepted from the Admiralty, July 5, 1917. In 1918, a British officer from the Admiralty was sent to Washington to assist and cooperate in joint convoy plans. The plans and routings for our troop convoys were handled entirely by our own forces. The troop convoy plans, as prepared by Admiral Sims, were accepted, but where one end of the route rested in Europe under Admiral Sims, and one in the United States under Admiral Gleaves, the Office of Operations acted as the coordinating agent between the two individual commanders. The first troop convoy of June 14, the plan for which originated in the

United States, none yet having been sent us by Admiral Sims, or at least not having been received yet, was not an unqualified success, that it was a waste of effort, for the protecting force of destroyers. The troops were sent over safely, but the measures which had to be taken to guard them were not economical. This was the subject of criticism by Admiral Sims. His suggestions were immediately accepted, and his plan, which we received after the first troop convoy sailed, was adopted for other troop convoys.

Paragraph 39. No comment.

Paragraph 40. No comment.

Paragraph 41 of Admiral Sims's letter is as follows:

41. As the possession of adequate shipping was an imperative requirement in this war, it follows that the essential policy was to pool all antisubmarine forces and use them to the best possible advantage for the protection of all shipping, regardless of the flag it happened to be under. As the winning of the war was the paramount object, and as our antisubmarine forces and those of the Allies were always inadequate, and as it was consequently impossible to prevent a certain amount of loss, it was apparent that the game was to reduce the combined loss of allied shipping below a point which would defeat the objective of the enemy and thus insure victory of the common cause as a whole.

Paragraph 41. This is correct. This policy relating to shipping was accepted by the department. We concurred in the policy of pooling antisubmarine forces, as evinced by the disposition of our destroyers based on the Irish coast, under a British admiral, and in the disposition of our forces in the Mediterranean and at Gibraltar. We reserved the right merely of protecting our troops and the supplies to those troops as a right of paramount importance.

Paragraph 42 of Admiral Sims's letter is as follows:

42. It was repeatedly explained that if we could actually entice the enemy into shifting his submarines to our coast it would be greatly to the advantage of the common cause, even granting that our shipping would suffer somewhat more severely; that the chances of the enemy shifting any of his operations to the United States coast without our having advance knowledge, while remote, was a fully justifiable risk, and therefore that such considerations should not deter us in any way from throwing every possible bit of naval strength into the fight on the actual "front," that is, in the "war zone" in European waters. Moreover, that the risk was slight, as vessels could be sent back, if necessary, before submarines could reach our coast or could do much damage. In making long passages submarines necessarily steam at slow speed—from 5 to 6 knots.

Paragraph 42. This is correct. This was accepted by the department as being true, and the department's policy was to send all antisubmarine craft to Europe which could be efficiently used there. There was much pressure brought to bear upon the department from various sources to make it keep back some of our antisubmarine forces on this side. From private sources; from the British commander in chief in Atlantic waters; from Admiral Gleaves, the commander of our transport forces; from Admiral Mayo, commander in chief of the Atlantic Fleet, pressure was brought to bear to give to their forces submarine protection, but the chief of naval operations never deviated from his general policy of sending our antisubmarine craft to Europe. Practically the sole exception to this policy was in the few destroyers kept on our own coast for the convoy of our own troopships, and the tugs essential for our own uses. The numbers of these destroyers were few. The War Department insisted upon it, and the public opinion would not stand for our troops going across without a certain amount of protection being given to the ships from the beginning of the war to the end.

I remember a conference held in the chief of naval operations office, I think in the spring of 1918, between the chief of naval operations, Admiral Benson (the commander in chief), Admiral Mayo and the commander of the transport forces, Admiral Gleaves, at which I was present, when the policy of sending all of our destroyers abroad was discussed. Both Admiral Mayo and Admiral Gleaves thought that it would be wise to keep more destroyers on this side both for the fleet and for the transport service, in view of the fact that we never could be quite sure of where and when the German submarine would strike. In this matter I remember Admiral Benson stood firm and did not change his policy of endeavoring to send all of the effective antisubmarine craft abroad. However slow the actual desired results may have been; however delayed the destroyers were in getting across, and the delays were many and disappointing to us, as well as to Admiral Sims, there was no question as to the department's attitude of mind, nor of the efforts taken by operations to hasten them along.

Paragraph 43 of the letter of Admiral Sims is as follows:

43. Submarines attacked almost exclusively merchant vessels, thus cutting off supplies essential to the armies. This was their correct mission, and they wisely avoided conflict with allied naval vessels. It was, therefore, our mission to adopt such tactics as to force the submarines into contact with the Allies' military vessels, while protecting the merchant shipping. This meant antisubmarine craft in such numbers that the submarines could not reach their prey without encountering them. It was for this reason that it was continuously urged that everything be sent, not only destroyers, which are preeminently the best antisubmarine craft, but also yachts, gunboats, tugs, etc.; in fact, any craft that could steam across the ocean or be towed across.

Paragraph 43. Submarines did attack merchant vessels oftener than troopships, but not from the military reason that it was better to sink supplies than troops. Our troops were carried in merchant ships, but our troop convoys were much better protected than the merchant convoys; they were more dangerous to attack, and the ships themselves more difficult to sink. However, one troopship when sunk was usually worth much more than one supply ship. Many merchant ships could be sunk without eliciting one iota of the general anxiety in our country which the sinking of one troop transport would cause. The public opinion is a very important factor for any military organization to reckon with in war. The public and the War Department demanded adequate protection for their troop transports and it was given. Even though there were times and places where the Navy did feel that a little reduction in the protecting forces could be made, we could afford to take no chances with the troops, and this was sound military judgment, I think, for our military forces were the units intended to deal the final blow to the Germans, the blow which was delivered when a sufficient force had been landed and trained in France. So important was it considered to get our troops over, that beginning with the spring of 1918 and through to July and August the French and British military missions in our country were directing every effort to that end, especially in the matter of Infantry divisions and machine-gun battalions, even at a sacrifice in the matter of supplies, and some ships that had been carrying supplies were converted into troop transports.

The CHAIRMAN. It is 12.30 o'clock, Captain, and I think we will have to stop now. We will continue to-morrow morning.

(Thereupon, at 12.30 o'clock p. m., the subcommittee adjourned until to-morrow
April 20, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

TUESDAY, APRIL 20, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235, Senate Office Building, at 10 o'clock a. m., Hon. Frederick Hale presiding.

Present: Senators Hale (chairman), Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Will you continue, Capt. Pratt?

TESTIMONY OF CAPT. W. V. PRATT—Resumed.

Capt. PRATT. Continuing my testimony from where I left off yesterday, paragraph 44 of the letter of Admiral Sims reads as follows:

44. It is quite true that there were many naval activities outside of the Eastern Atlantic, such as in Caribbean, South Atlantic, Pacific, and Asiatic waters. But, considering the rapidity with which at the time in question we were losing the war in the submarine zone, these forces were of little importance—practically none as regards ultimate success. A great deal of unnecessary effort was expended in these areas. It was repeatedly pointed out that we could afford to lose some antisubmarine craft, but could not afford to continue the loss of merchantmen at the rate then being sustained.

My comment on that is, the office of operations realized full well that the areas mentioned were not vital areas with one exception. It was strictly necessary to preserve the flow of oil from Mexico and the Gulf to Europe. This oil was vital to the British fleet and to our own, and the oil reserve was low. We began in the early summer of 1917 with few exceptions the task of withdrawing our few remaining forces of every description from all other stations in the world and of focusing them in the war area. The destroyers in the Philippines were sent through the Red Sea to the Mediterranean, only a few old submarines and small gunboats taken during the Spanish War, together with one old monitor, were left in Asiatic waters. All submarine chasers built and building, except about five, and all submarines except five for training purposes, all destroyers, together with all valuable cargo and supply ships, were drawn around to the Atlantic from the Pacific. A division of four cruisers, which was later reduced, was maintained in South American waters under Admiral Caperton, to cooperate with South American countries, principally Brazil, which had entered the war. The Caribbean station and patrol was arranged, in April, after joint conference with the British commander in chief and French admirals in our waters, acting as naval representatives of their respective countries. Our

forces in home waters were, according to accepted policy, being reduced to the minimum, and this minimum consisted for the most part of some submarine chasers and those yachts, destroyers, and tugs which were not fit and did not have the steaming radius to cross the Atlantic.

All other craft except the battleships, some submarines, and a few cruisers and destroyers for convoy duty were started, if they had not already gone, on their way to Europe, as they became materially available. When our submarines were asked for, they were sent as soon as they could be made ready; but if I recollect correctly, at the time of asking Admiral Sims did not want them all sent, and at various times he advised their use by us in home waters in case of attacks by German submarines. The new destroyers building were, with very few exceptions, upon completion slated to go across for operations in European waters.

Paragraph 45 of Admiral Sims's letter is as follows:

45. It was realized, of course, that if a considerable number of antisubmarine vessels was not kept on our coast there would be risk of public criticism which, in time of war, must not be based upon inadequate information, because to inform the public would be to inform the enemy. But I strongly advise that this risk be accepted; that we should not be influenced in our war measures by the possibility of such adverse criticism; that the situation made it imperative that every possible means be used to defeat the enemy as speedily as possible, regardless of other considerations, and thus save many valuable lives.

This was realized at home in the department as well as in Europe, and it was not permitted to handicap our efforts. The craft on this side made a brave showing, but apart from our submarines they were practically useless as submarine fighters and were almost exclusively craft that could not get across the Atlantic.

Paragraph 46 of Admiral Sims's letter is as follows:

46. Perhaps the most remarkable situation disclosed by the correspondence with the department is that during the most critical period—the first four months after we entered the war—I had but one aid, and that for more than the first year I had a wholly inadequate staff.

This is true, and it was an error in judgment, I think. The office of operations was just as badly off. We gave them in London the best men that we had in our office here to help them out when we could not spare them. At the beginning of this war the Navy was very short in trained officers and men to cope with operations of the magnitude which we were called upon to undertake. This shortage retarded the flow of trained men and ships to Europe. The fleet and all home craft, including the cruisers used in convoy, had to be used for training purposes. The Navy had to be expanded from some sixty thousand and odd men to over five hundred thousand, and while training had to operate at the same time.

Paragraph 47 of the letter is as follows:

47. With all the insistence possible it was explained, in numerous cables and letters, for four weary and anxious months, the absolute necessity of further assistance in order to handle the situation effectively, but only to receive always the same answer, namely, that officers were "not available."

Paragraph 47. This is correct. We were in the same fix and far worse at home. The fleet claimed it was being ruined by lack of trained officers. There were only so many, and they had to be spread out in a very thin layer.

Paragraph 48 of the letter is as follows:

Finally, in July, 1917, my only aid was unable longer to support the continuous strain of the past four months' work, including the very anxious task of planning for and handling the troop convoys then arriving. And it was only after this fact had been cabled that three officers were sent out, though the department still declined to provide the adequate staff that had been requested, with full explanations of the types of officers required and the necessity for each. I urged the department to send me at least the staff that the commander of one flotilla of destroyers would have at time of peace. But all in vain.

Paragraph 48 of the letter, no comment.

Paragraph 49 of the letter is as follows:

As it gradually became apparent that support in this matter need not be expected. I began slowly building up a staff by detaching officers from some of the ships. This was, of course, regrettable, as many of the ships were at that time short of officers, but it was necessary, on pain of the whole force becoming ineffective through the rapidly growing and essential administrative work getting beyond the capacity of the headquarters force. Ultimately this force consisted of about 60 regular and 40 reserve officers and 1,000 enlisted men and clerical force for the administration, supply, and operation of widely dispersed forces of about 370 ships of all classes, 100 officers, and 75,000 men. Its necessity was finally, I believe, tacitly recognized by the department, but not until near the end of the war, when a few officers were sent for staff duty. If it had been recognized from the beginning, as well as the necessity of sending all possible antisubmarine forces, there can be no doubt that the end of the war would have been hastened and hundreds of thousands of tons of shipping and many lives would have been saved.

This policy had already been started on this side of the water. Admiral Sims's forces were the only ones that were anywhere near manned to full complement, either in officers or men. In proportion to the forces he had under him, he had more trained men and officers than the rest of the Navy. This was a perfectly correct policy to pursue, in view of the fact that these were the men who would be most actively engaged with the enemy. Everybody wanted to go with Sims, where the fighting and glory were to be, and none wanted to stay at home with the drudgery. I must reiterate again that the necessity for sending antisubmarine forces abroad was fully recognized. The results were not what either Admiral Sims nor we desired; but the principle was recognized, and an earnest effort was being made to get them fit and overseas as fast as possible.

Paragraph 50. Correct. No comment.

Paragraph 51. Granted.

Paragraph 52. No comment.

Paragraph 53 of Admiral Sims's letter is as follows:

If the department realized these conditions, it is made clear by the records that it was not influenced by them. The correspondence shows that I was trying to get the department to understand that I was confronted with an impossible task—that it was actually physically impossible for me and one aid to carry on efficiently the necessary operations of the forces, let alone comply with the department's demands for the details of information concerning all the various plans of the Allies, the details of all methods and appliances used, etc. All this, not to mention the details required concerning new construction, new types of vessels, new methods of gunfire, etc.

Paragraph 53. Granted. It was a stupendous task with which he was confronted. An adequate staff was required from the beginning. When Admiral Benson went abroad, this office was stripped of some of its best men when they could not be spared. In spite of the difficulties, the fund of operating information, plans, policies, data from all of the allied nations except Russia, etc., collected in our office through the effort of Admiral Sims, was enormous.

Paragraph 54 of the letter is as follows:

54. In a word, it would hardly be possible to conceive of a more complete misunderstanding by the department of the actual situation that confronted me on the other side, particularly during the critical period of the war.

This seems hardly the correct way to express the situation. It was natural that the complete understanding and cooperation which we hoped for and which grew as the war progressed, should not exist at first in the same degree that it did later. It is not possible to jump from peace to war, and in a few days have every man alive to the situation, and to the danger and responsibilities confronting him, to the same extent that he is later. We all developed as the war progressed. It was not a misunderstanding, but rather a natural period of transition, during which the viewpoints became adjusted.

Paragraph 55 of the letter is as follows:

55. On a number of occasions I invited the department's attention to the fact that it was impossible intelligently to direct the operation of our forces from Washington that if we were to cooperate with the allied navies, which was the only efficient way of participating in the war, it was essential that we keep in close personal touch with the heads of the allied navies in the war area.

This principle seems sound so long as the operations were confined to tactical operations, and conformed with the general plans and policies approved by the Admiralty and in Washington. The Department at home should not interfere with the detailed movements of our naval forces at the front, and did not in any marked degree do it, but should set its mark of approval upon every change of plan of magnitude or any new important plan, before the operations involved in these changes are carried on at the front, without reference to the Department. If this paragraph is intended to carry the suggestion that the Navy Department should be moved to London, the suggestion is not sound.

Paragraph 56. No comment.

Paragraph 57. No comment.

Paragraph 58. This is correct. No comment.

Paragraph 59 of the letter is as follows:

59. The policy indicated by the dispatches in question may be summed up by the statement that ships as well as troops in the field, no matter what their individual skill, would be very heavily handicapped if their combined efforts were not coordinated and directed from the most central source of all available information.

This is correct. With reference, however, to our total naval effort, this position is not necessarily at the front. Our total naval effort in this war consisted less in the operation of forces at the front than in a logistic effort in the rear, in which the greatest problems we had to contend with, originated and had to be solved, here at home. It must be noted that in this war the main united naval effort was one of logistics.

Paragraph 60 of Admiral Sims's letter is as follows:

60. The department frequently omitted to keep its naval representative abroad informed of its plans, intentions, and sometimes even the movements of forces in the European area, and there was at times embarrassment caused by lack of general information concerning the Navy's activities in other areas, such as the South Atlantic Pacific, etc. As foreign forces and shipping were also operating in those areas, it was embarrassing not to be able to answer in conference with the Allies all questions concerning our actual naval activities as well as prospective plans, the carrying out of which would necessarily influence allied plans.

It was always the department's intention to keep Admiral Sims fully informed in all such matters. If we failed in this respect it was, of course, an error and an omission. Errors happened, naturally, but in the vital essentials he was informed. There was, moreover, a double check in this matter. We were at all times in the closest touch here with the various naval representatives of the Allies, particularly with the British Commander in Chief and with the French Commander in Chief, and the various liaison officers. We had no secrets from them and they had none which they kept from us. Matters of importance which we might have forgotten to inform Admiral Sims about would be almost sure to reach the naval department of one of the allied powers with which we were closely associated. Admiral Sims's representatives in Europe were closely in touch with each allied office. He was almost sure to be in touch with all information as he had been, at his own request created attaché in London, and we had directed all other attachés to forward their important information through him first, before sending it to us, that he might be in position, if necessary, to act immediately without reference to the department at home if the urgency of the situation demanded.

Paragraph 61. No comment.

Paragraph 62 of the letter is as follows:

62. Apart from the resulting lack of coordination, it was very difficult—I fear sometimes impossible—to avoid the impression conveyed thereby to the heads of the allied navies that I was not being supported or was not in the confidence of the department.

Paragraph 62. This seems difficult to understand in view of the backing the Office of Operations was giving the admiral.

Paragraph 63 of the letter is as follows:

63. Delays and confusion were caused by the department's dealing directly from Washington with European naval officials in Europe without using its own representatives there to investigate conditions at the "front," discuss all details with the allied navies, and thus coordinate effort.

Paragraph 63. Not understood. It had a perfect right to do so. It should however keep Admiral Sims informed.

Paragraph 64 of the letter is as follows:

64. For example, on May 8, without previous explanation, the department announced its intention to establish naval bases at Bordeaux and Brest, although on May 5, it had been informed of the results of a conference with the French naval authorities and their agreement that our forces should remain concentrated at that time in the area of greatest enemy activity.

May 8, 1917, was before the time I came into very active connection with the Office of Operations. The Chief of Naval Operations and Assistant for Material are more qualified to speak on this particular point than I.

Paragraph 65 of the letter is as follows:

65. Delays and confusion were also caused by dealing with representatives of foreign countries stationed in America, who made independent and strenuous demands for ships, coal, and other supplies, etc., without reference to the demands or necessities of others. The department thus ignored its own representative who was manifestly abroad for the paramount purpose of investigating the details of all such requests, and determining, after conferences with the allied navies, their relative merits and, particularly, their relation to the necessities of the antisubmarine campaign.

Paragraph 65. This is a matter of opinion. We were the source of all supplies and the center of all supply efforts. This is one of

in which the forces may be engaged. To do anything else is to commit an error, because it commits your commander in the field, whoever may be the commander detailed to handle local operations, to a movement to which he can not adjust himself well. Therefore a distinction must be drawn, as I said before, between the base plan which it is the province of the board to draw, and the more detailed plans of operations, which must continually adjust themselves to local conditions as they occur. I wish also at this time to make comment upon Admiral Fiske's interpretation of what a general plan must be. If we were to accept in toto all that Admiral Fiske has stated about a general plan, and the ability to put your hand in a drawer and pull out a plan which at once throws us into war, that is at once to accept the proposition that we are a military nation, and having a man like Von Moltke, he can put his hand in a drawer and commit himself to a movement at once, because that means that the aggressive nation can always take the initiative.

A nation on the defense has got to adjust itself to the initial movement that enemy plans against it, and that is why there must be a distinction made between the general plan, as Admiral Fiske has outlined it, and a general plan which a nation like the United States must make in order to prepare itself for war. There is a vast difference in the conception of the two ideas and in the execution.

I submit herewith a list of plans of preparation. [Reading:]

DISCUSSION.—I. PLANS PREPARATION.

1. General plan (discuss), General Board plan.
2. Armed neutrality.
- 2a. Armed guard plan.
3. Naval district.
4. To render the maximum possible support now to the enemies of the Central Powers.
5. Make a general estimate of the character of service which will be required of our naval forces in order to serve best our own interests and to cooperate with our allies.
6. Adopt the policy that our present mobile naval forces shall be so distributed and used that they further the immediate mission and do not handicap it.
7. Organize the destroyers and remaining naval mobile forces into a patrol force to cooperate with the naval district force in combating the present submarine warfare.
8. Patrol force.
9. Make an estimate of the numbers and types of small craft necessary to obtain now in addition to the naval craft already assigned in order to put the coast defense districts in a position to cope with the immediate situation—antisubmarine war.
10. Outline the general scheme whereby we may furnish assistance to the allies in the shape of small craft without interfering too greatly with our own similar needs and without disrupting our own organizations.
11. Direct the policy of our naval bases as to their repair, reserve operating and supply facilities to meet the following conditions: 1. The needs of the immediate situation. 2. The future needs.
12. Plan for the expenditure of the naval emergency fund, so as to best supplement current appropriation for a period of six months.
13. Establish a policy with reference to the use of mines in the present emergency.
14. To indicate the steps tending to make life, ships, property, of vessels carrying armed guards, self protecting.
- 14a. To make an estimate of the number of merchant ships fit for such service it might be necessary to commission as naval auxiliaries to cooperate with the allies in protecting shipping from German raiders.
15. To outline the general plan whereby naval vessels may be requisitioned for guns to place on merchant shipping.
16. Mobilization, April 6, 1917. (Ship's data and readiness for service).
17. Plan for cooperating with Allies.

18. Establish the policy to be adopted toward the German vessels now lying in ports.
19. Fuel oil for naval purposes.
20. Outline general scheme for the efficient cooperation of information—plans—operations.
21. To outline the best general plan to get troops to the western front in a manner which will—
- (a) least interfere with any active offensive the Navy may be called to participate in; (b) not interfere with the mission of logistics; (c) best safeguard the certainty of the arrival of the Army forces at the destination; (d) least endanger our country's vital interests.
22. Taking over transports.
23. The naval position and needs in the matter of Panama Republic with special reference to the defense of canal.
24. Outline of the policy for cooperating with the Emergency Fleet Corporation along the lines suggested by Gen. Goethals.
25. Inaugurate a naval building program which will best meet our immediate needs and which will not be inharmonious with any future policy we may be called upon to adopt.
26. Report of submarine board already submitted, marked B.
27. Policy for priorities of personnel.
28. Mobilization plan, November 3, 1917.
29. District defense—Already submitted, marked I.
30. Revised plan for coast defense by submarines.

Now, the first general plan of which I have any knowledge—because I did not come into the office until after February, or during the first part of February—which in any way affected the detailed movement, which were necessary for us to commit ourselves to in order to have proper plans for this work, is the one spoken of by the general board, its plan of February 10, 1917. The general board plan that Admiral Badger speaks about (I have not seen it) I think is a plan which puts us in readiness to cope with our enemy alone. That was not the situation which faced us.

The CHAIRMAN. What was the date of that plan?

Capt. PRATT. Number 4, I think, was the one I speak of; but this one, the first one we took up, is one dated February 10, and that is the plan, by the way, which the general board submitted in one copy, and which has been lost. I can find no trace of it anywhere. The only reasonable assumption that I can make is that my predecessor, Capt. Chase, who drew it up, or who drew the assumptions up, had the plan submitted to him, and it was mislaid at his desk. There was but one copy. I do not know where that is, and nobody else knows; but I can read the assumptions upon which that plan was based; and, incidentally, I wish to say that did not have a great deal of bearing on the subject.

The CHAIRMAN. That was the plan of February 10, 1917?

Capt. PRATT. Yes; the plan of February 10; and I can state that with a certain degree of assurance, because, being in the plans section in conjunction with Capt. Scofield and Capt. Scott, I personally myself wrote all of these on the typewriter, so that I know something about what we were thinking of at the time.

On February 10 Capt. Chase submitted to the general board the following letter, which I will read. It is the first time I have seen any note made of this particular subject. [Reading:]

FEBRUARY 10, 1917.

To: The general board.

Subject: Solution of problem.

1. The department desires the general board to consider the following problem and submit its solution as soon as practicable:

PROBLEM.

General situation.—Conditions as at present except that war with Germany declared.

Special situation.—The allies do not desire our battleship force at present.

Required.—Naval estimate of the situation: First, as to the grand strategy demanded by the situation; second, as to disposition of battleship force; third, as to method of assisting in maintaining communications with Europe including scheme for cooperation with allies; fourth, as to methods of driving submarine from the sea.

Assume.—Mobilization of all naval vessels and possibility of mobilizing merchant vessels as required.

JOSEPHUS DANIELS

The CHAIRMAN. What date was that?

Capt. PRATT. February 10, 1917.

The CHAIRMAN. That was the one the answer to which was lost?

Capt. PRATT. That is the one the answer to which was lost.

On February 17 the General Board submitted to the Secretary of the Navy the following [reading]:

GENERAL BOARD, NAVY DEPARTMENT,
Washington, February 17, 1917.

To: Secretary of the Navy.

Subject: Solution of problem, Black. Reference (a) Navy Department confidential letter of February 10, 1917.

1. In accordance with reference (a), the general board submits herewith problem and solution based upon the general and special situations described in the Navy Department's instructions.

CHARLES J. BADGER.

The CHAIRMAN. That is not a reply to that letter?

Capt. PRATT. No, no; not a reply, but it simply authenticates the fact that a reply was sent.

Now, to come to the plans. The work on these passed from the General Board to the plans section in operations. On March 8, 1917, there was worked out by Capt. Schofield in the plans section, a complete plan of armed neutrality. That was the plan from which the armed guard system flowed. It was drawn up purposely as the last resort that this country might possibly take unto itself to keep from being involved in war. The whole plan is here, and I offer it. The important factor in it is the policy upon which the details of the plan were based.

The CHAIRMAN. It was an operational plan and not a general detailed plan?

Capt. PRATT. Oh, no; it actually carries the operations; prescribes all the rules and regulations which the merchant captains must adopt. It prescribes when they may open fire and when they may not. It was my plan.

The CHAIRMAN. I say it was an operational plan. You make a distinction between the two, do you not?

Capt. PRATT. Yes; an operational plan, and put up by the plans section of operations. It was put out by Capt. Schofield. [Reading:]

POLICY.

American merchant vessels are armed for the sole purpose of defense against the unlawful acts of the submarines of Germany and of her allies. Their armament can not be used for any other purpose.

It is lawful for the submarines of Germany and her allies to exercise all the rights of belligerent vessels of war and it is unlawful for any American merchant vessel to resist the exercise of any of those rights.

It is unlawful for the submarines of Germany or of her allies (1) to attack a merchant vessel by gunfire or by torpedo fire except that the vessel attempt to escape or resists or does not heed a summons to stop; (2) to approach a merchant vessel submerged as if for attack; (3) to sink or attempt to sink a merchant vessel before the crew and passengers have been placed in safety, except that the vessel is at the time sinking or attempting to escape; and (4) to require the passengers and crew of a merchant vessel to take to the ship's boats when such act places the lives of the passengers and crew in serious jeopardy.

The rest is detail, rules for the masters to adopt, and so on. The whole plan I will submit.

The plan is as follows:

ARMED NEUTRALITY—RULES FOR THE CONDUCT OF AMERICAN MERCHANT VESSELS.

POLICY.

American merchant vessels are armed for the sole purpose of defense against the unlawful acts of the submarines of Germany and her allies. Their armament can not be used lawfully for any other purpose.

The belligerent right of visit and search can not be lawfully resisted by a neutral merchant vessel. The announced policy of Germany to sink all vessels that enter certain areas of the high seas has led the Government of the United States to authorize its merchant vessels to resist any and all attempts of the submarines of Germany and her allies to approach, visit, or search American merchant vessels on the high seas.

American merchant vessels are forbidden to pursue or to search out the submarines of Germany or of her allies, or to engage in any other offensive warfare against them.

The following regulations amplify and define more precisely the policy above outlined:

REGULATIONS.

1. The belligerent right of visit and search is hereby denied to the submarines of Germany and her allies.

2. It shall be lawful for any American merchant vessel to fire upon any submarine of Germany that attempts to approach or that lies within 4,000 yards of the commercial route of the vessel sighting the submarine.

3. No American merchant vessel shall attack a submarine of Germany or her allies that is retiring or is attempting to retire.

4. No American merchant vessel shall ever assist in hunting for submarines of Germany or of her allies.

5. No American merchant vessel shall fire at any submarine of Germany or of her allies that lies more than 4,000 yards from the commercial route of the vessel sighting the submarine except that the submarine shall have fired first.

6. Every effort compatible with the safety of the merchant vessel shall be made to save the lives of the crew of any submarine that may be sunk or that submits.

7. Every effort shall be made to avoid the submarines of Germany or of her allies.

8. American colors shall be displayed conspicuously at sea during daylight.

POLICY NO. 2.

American merchant vessels are armed for the sole purpose of defense against the unlawful acts of the submarines of Germany and her allies. Their armament can not be used lawfully for any other purpose.

The belligerent right of visit and search can not be lawfully resisted by a neutral merchant vessel. The announced policy of Germany to sink all vessels that enter certain areas of the high seas has lead the Government of the United States to authorize its merchant vessels to resist any and all attempts of the submarines of Germany and of her allies to approach, visit, or search American merchant vessels within the zones proscribed by Germany. American merchant vessels outside the zones proscribed by Germany shall not resist the exercise of the belligerent right of visit and search by the submarines of Germany and of her allies.

American merchant vessels are forbidden to pursue or search out the submarines of Germany or of her allies, or to engage in any other offensive warfare against them.

The following regulations amplify and define more precisely the above outlined:

REGULATIONS.

1. The belligerent right of visit and search is hereby denied to the submarines of Germany and her allies within the zones proscribed by Germany.
2. The belligerent right of visit and search is permitted to the submarines of Germany and of her allies on the high seas outside of the zones proscribed by Germany.
3. It shall be lawful for any American merchant vessel to fire upon any submarine of Germany or of her allies that attempts to approach or that lies within 4,000 yards of the commercial route of the vessel sighting a submarine, if the submarine is sighted within the zones proscribed by Germany.
4. It shall not be lawful for any American merchant vessel to take any offensive action against any submarine of Germany or of her allies on the high seas outside of zones proscribed by Germany, unless the vessel is fired at either by guns or torpedoes or unless the submarine is submerged.
5. No American merchant vessel shall attack a submarine of Germany or of her allies that is retiring or attempting to retire.
6. No American merchant vessel shall ever assist in hunting for submarines of Germany or of her allies.
7. No American merchant vessel shall fire at any submarine of Germany or of her allies that lies more than 4,000 yards from the commercial route of the vessel sighting the submarine except that the submarine shall have fired first. Further, if the submarine that fires first is sighted outside of the zones proscribed by Germany, the presumption shall be that the shot is a warning shot and not an attack until the contrary fact is established.
8. Every effort compatible with the safety of the merchant vessel shall be made to save the lives of the crew of any submarine that may be sunk, or that submitted, or is in distress.
9. Every effort shall be made to avoid the submarines of Germany and of her allies.
10. American colors shall be displayed continuously at sea during daylight.

POLICY NO. 3.

American merchant vessels are armed for the sole purpose of defense against the unlawful acts of the submarines of Germany and of her allies. Their armament can not be used for any other purpose.

It is lawful for the submarines of Germany and of her allies to exercise all the rights of belligerent vessels of war and it is unlawful for any American merchant vessel to resist the exercise of any of those rights.

It is unlawful for the submarines of Germany or of her allies—

1. To attack a merchant vessel by gunfire or by torpedo fire, except that the vessel attempt to escape, or resists, or does not heed a summons to stop.
2. To approach a merchant vessel submerged as if for attack.
3. To sink or attempt to sink a merchant vessel before the crew and passengers have been placed in safety, except that the vessel is at the time resisting or attempting to escape.
4. To require the passengers and crew of a merchant vessel to take to the ship's boats when such act places the lives of the passengers and crew in serious jeopardy.

PRECAUTIONARY.

Communicate with the commandant of the naval district before leaving a United States port to make sure you have the latest information and instructions.

Your safety requires that you obey all instructions from vessels of war of the United States or of friendly powers.

Keep your intended route secret, but file it with your agent before sailing. Patrol vessels may prescribe your route to avoid new dangers or to insure that vessels shall scatter on the high seas.

Sail near dusk or at hour designated by local authorities.

Make land falls at night.

Make port at dawn or at hour designated by local authorities.

Proceed through neutral waters—that is, waters within 3 miles of a neutral shore, whenever practicable.

Advantage should be taken of the protection afforded by patrol vessels wherever such protection is afforded.

Always proceed at highest possible speed when within 150 miles from land. Speed is an excellent protection against submarines.

Make no entries in log concerning sighting of vessels of the United States or of friendly powers or concerning any communication received from such a vessel.
 Do not show navigational lights at night except to avoid collision. Keep ships properly darkened at night.
 Keep boats rigged out ready for lowering.
 Never go to the assistance of a vessel that is being attacked or that has just been attacked.
 Always carry steam ready for a spurt of speed.
 Maneuvering in narrow waters or whenever the presence of submarines is suspected is an excellent safeguard against submarine attack.
 Look out for explosives in taking on board fuel or cargo.
 Have sharp lookouts kept for submarines and mines at all times, particularly from ahead to abaft either beam.

ON SIGHTING A SUBMARINE.

On sighting a ship at sea, change course so as to insure that you will not close her unless she gives chase, in which case bring her astern and keep her there until chase abandoned or vessel is recognized.
 If the submarine is sighted on the surface beyond torpedo range, bring submarine to the beam and keep her there. If submarine attempts to close, bring her astern and proceed at highest possible speed.
 If submarine is sighted close aboard forward of the beam, the greatest safety lies in making course directly toward the submarine.
 If submarine is sighted close aboard abaft the beam, the greatest safety lies in turning away from the submarine and proceed at highest speed.

ON OPENING FIRE.

1. Hoist national colors before first shot is fired.
2. Once it has been decided to open fire, do not submit to the gun fire of a submarine so long as ship's battery can be used.
3. Do not fire on a vessel at night unless attacked by that vessel.
4. Send all persons except bridge force and the guns' crews below decks while ship is under fire.
5. Watch out for torpedoes and maneuver to avoid them. If unable to avoid them, maneuver so that they will strike a glancing blow.
6. If capture is imminent, destroy all documents, log books, papers, etc., by burning.

MISCELLANEOUS.

If you see a suspicious object in the water, do not watch it so hard that you will not see a possible mate near by.
 Sink all floating torpedoes found. Look out for the nose of a torpedo, as a moderate blow there will explode the torpedo. Never ram a torpedo, but sink it by gun fire or sending a small boat alongside to attach a heavy load to the tail.
 Sink all mines sighted at sea, using rifle fire. High velocity, small bore, rifles, with ball bullets are best for this purpose.
 Never assume that a mine or torpedo is safe. It is not.
 Report to the Navy Department, or nearest naval authorities all mines, torpedoes, submarines and suspicious objects that are encountered at sea. The report should contain the following information:

- a. Exact position in which sighted.
- b. Date and hour.
- c. Distance at which seen and examined.
- d. Shape and general appearance.
- e. Whether floating or moored.
- f. What was done with object.
- g. What did ship do.
- h. Additional details and remarks.

Passenger and noncombatant members of the crew can not lawfully engage in offensive operations except under the orders of the master or the officer in charge of the gun.

INFORMATION.

Submarines have been known to disguise themselves as fishing steamers showing smoke coming from their funnels, and as sailing vessels.

Submarines lay mines that may show a dummy periscope. The periscope may be recognized by the fact that it does not bob about and wobble, the fact that it is usually in motion, leaving a frothy wake.

Submarines do not like to use their torpedoes, as they carry only a limited number. When these are exhausted, they must lose time by returning for a new supply. They prefer to attack by gunfire.

Submarines that attack at night are usually not submerged. A machine-gun fire is very effective in beating off the night attack of a submarine.

Shallow water by day is fairly safe from submarines, but mines are more often encountered in shallow water than in deep water.

NAVAL DETACHMENT.

The master of a merchant vessel commands the vessel, her passengers and crew. The naval detachment is subject to the orders of the master of the vessel, except as to the employment of the ship's battery.

The ship's battery, being a part of the military force of the United States, is used in accordance with the instructions of the Navy Department. The commanding officer on board the merchant vessel shall be responsible for the execution of the instructions of the Navy Department relating to the employment of the battery.

Fire shall never be opened except by joint consent of the master and the senior naval officer on board. The joint consent of the master and the senior naval officer may be given in advance of the emergency, but the responsibility of the master for the proper employment of the battery shall not thereby be lessened.

Fire shall cease when the senior naval officer on board so directs. The movements of the ship shall not be controlled, even during an emergency, by the senior naval officer on board, but he shall advise with the master as to directing the movement of the ship for defensive purposes.

The naval officer commanding the naval detachment shall rank as a captain on the ship next after the master, except that he shall not be eligible for such command of the ship.

The discipline of the naval detachment shall be administered by the commanding officer of the detachment.

The members of the naval detachment shall perform no ship duties not connected with the serving of the gun, military lookout duty, and the maintenance of their quarters.

The enlisted personnel of the naval detachment shall be quartered together in a manner satisfactory to the naval officer commanding the detachment.

The senior naval officer on board shall be responsible for—

- (a) The condition of the battery and its appurtenances.
- (b) The training of the guns' crews and spotters, including members of the crew detailed by the master to assist in the service of the guns.
- (c) The readiness of the ship's battery day and night.
- (d) The readiness of the naval detachment to man the guns at day and night.
- (e) A continuous lookout near each gun.
- (f) The making of all reports required by the Navy Department.

MEMORANDUM.

ARMED NEUTRALITY.

The term "armed neutrality" has its origin in the League of Russia, Prussia, and Denmark, of 1780.

Previous to that date, the respective rights of neutrals and belligerents were not settled and defined clearly by the conventional law of Europe, to which the powers had given sanction. The principles governing these rights were:

- (a) That free ships gave freedom to the merchandise except contraband.
- (b) That neutrals might sail freely to and between enemy's ports and were blockaded.

When the war between France and Spain on the one hand and Great Britain on the other broke out, Great Britain betrayed a disposition to deviate from the principles. Great Britain's nonadherence to the principles above mentioned caused the Netherlands to join with France in the war, and caused the

celebrated declaration containing the principles to which the commanders
moments were told to adhere.

principles were:

1. All vessels may freely sail from port to port and on the coast of the nations
at war.

2. Goods belonging to the subjects of the said nations at war are, with the
contraband articles, free on board neutral vessels.

3. In respect to the definition of contraband articles the Empress adheres to
of the Tenth and Eleventh articles of her treaty of commerce with
and extends the obligations therein contained to all the nations at war.
4. To determine what constitutes a blockaded port, this denomination is con-
sidered the entrance into which is manifestly rendered dangerous in consequence
of operations made by the attacking power with ships stationed and sufficiently

by which Russia made with the other members of the league, the fol-
lowing binding principles:

1. The cargo of a neutral ship, though the property of an enemy, should
remain on board unless the vessel be found laden with a larger quantity of articles con-
traband than is necessary for the use of the voyage.

2. That no merchandise should be deemed contraband of war but such as
is used in war.

3. That nothing should be carried into the port, or city of one belligerent
blockaded, or shut so closely by the ships of war or batteries of the
other that a merchant vessel could not attempt to enter without danger.

4. That the principles were communicated formally to the powers at war, together with
the declaration that the league had determined to maintain these principles by arms if

needed. The armed neutrality of 1780 was revived and several additional powers
were added to the principles of the league. The methods taken to enforce the armed
neutrality were: 1. The employment of convoys and squadrons cruising in the vicinity of the commerce
of the neutral nations to protect it.

2. In 1797, John Adams, then President of the United States, addressed
Congress regarding the protection of American commerce at sea. The orders of
Congress were: 1. That all vessels carrying goods of British manufac-
ture should be seized, whether these goods were then owned by neutrals and in neutral

President Adams stated in his speech that he entertained no doubt
of the propriety of the policy permitting vessels to employ means of defense while
engaged in lawful foreign commerce. He said further: "It remains for Congress
to make such regulations as will enable our seafaring citizens to defend them-
selves against violations of the laws of nations, and at the same time restrain them
from committing acts of hostility against the powers at war."

At the same time the President asked for increase in naval forces to give additional
protection to American commerce at sea. As a result of the President's request, Con-
gress passed a law authorizing employment of force for the protection of commerce.
The law found expression in the instructions of the Secretary of the
Navy to the fleet. These instructions were as follows:

of the United States:

1. To the commanders of armed vessels belonging to the United States,
Philadelphia the 10th day of July, in the year of our Lord one thousand seven
hundred and ninety-eight, and in the twenty-third year of our independence.

2. In accordance with the acts of Congress, passed the 28th day of May, the 28th day of
June, and the 9th day of July:

3. That you be authorized, instructed, and directed to subdue, seize, and take any
vessel, or vessels, sailing under authority or pretense of authority from
any republic, which shall be found within the jurisdictional limits of the
United States, or elsewhere on the high seas; and such captured vessel with her apparel,
furniture, and the goods and effects which shall be found on board
together with all French persons and others, who shall be found acting on
the coast within some port of the United States; and also to retake any vessels,
which have been captured by any French vessel—in order that proceedings
may be taken against the citizens of the United States, or persons resident therein,
concerning such capture or recapture in due form of law, and as to right
of property.

and, etc.,

(Signed) BEN STODDART.

to officers of ships of war, volume 1, 1798.

INFORMATION.

Submarines have been known to disguise themselves as fishing vessels, steamers showing smoke coming from their funnels, and as sailing vessels.

Submarines lay mines that may show a dummy periscope. The genuine may be recognized by the fact that it does not bob about and wobble as the fact that it is usually in motion, leaving a frothy wake.

Submarines do not like to use their torpedoes, as they carry only a limited supply. When these are exhausted, they must lose time by returning for a new supply. They prefer to attack by gunfire.

Submarines that attack at night are usually not submerged. A heavy machine-gun fire is very effective in beating off the night attack of a submarine.

Shallow water by day is fairly safe from submarines, but mines are more frequently encountered in shallow water than in deep water.

NAVAL DETACHMENT.

The master of a merchant vessel commands the vessel, her passengers, and crew. The naval detachment is subject to the orders of the master of the vessel in all matters except as to the employment of the ship's battery.

The ship's battery, being a part of the military force of the United States, is used in accordance with the instructions of the Navy Department. The senior naval officer on board the merchant vessel shall be responsible for the execution of the instructions of the Navy Department relating to the employment of the ship's battery.

Fire shall never be opened except by joint consent of the master and the senior naval officer on board. The joint consent of the master and the senior naval officer on board may be given in advance of the emergency, but the responsibility of the naval officer for the proper employment of the battery shall not thereby be lessened.

Fire shall cease when the senior naval officer on board so directs.

The movements of the ship shall not be controlled, even during action, by the senior naval officer on board, but he shall advise with the master as to methods of directing the movement of the ship for defensive purposes.

The naval officer commanding the naval detachment shall rank as an officer of the ship next after the master, except that he shall not be eligible for succession to the command of the ship.

The discipline of the naval detachment shall be administered by the naval officer commanding the detachment.

The members of the naval detachment shall perform no ship duties except those connected with the serving of the gun, military lookout duty, and the cleanliness of their quarters.

The enlisted personnel of the naval detachment shall be quartered and mess together in a manner satisfactory to the naval officer commanding the detachment.

The senior naval officer on board shall be responsible for—

- (a) The condition of the battery and its appurtenances.
- (b) The training of the guns' crews and spotters, including members of the ship's crew detailed by the master to assist in the service of the guns.
- (c) The readiness of the ship's battery day and night.
- (d) The readiness of the naval detachment to man the guns at any time, day or night.
- (e) A continuous lookout near each gun.
- (f) The making of all reports required by the Navy Department.

MEMORANDUM.

ARMED NEUTRALITY.

The term "armed neutrality" has its origin in the League of Russia, Prussia, Sweden and Denmark, of 1780.

Previous to that date, the respective rights of neutrals and belligerents had been settled and defined clearly by the conventional law of Europe, to which all maritime powers had given sanction. The principles governing these rights were:

- (a) That free ships gave freedom to the merchandise except contraband goods.
- (b) That neutrals might sail freely to and between enemy's ports except such ports were blockaded.

When the war between France and Spain on the one hand and Great Britain on the other broke out, Great Britain betrayed a disposition to deviate from the above principles. Great Britain's nonadherence to the principles above mentioned caused Holland to join with France in the war, and caused the Empress Catherine of Russia to join with Great Britain.

celebrated declaration containing the principles to which the commanders of armaments were told to adhere. The principles were:

1. Neutral vessels may freely sail from port to port and on the coast of the nations at war.

The goods belonging to the subjects of the said nations at war are, with the exception of contraband articles, free on board neutral vessels.

With respect to the definition of contraband articles the Empress adheres to the provisions of the Tenth and Eleventh articles of her treaty of commerce with Britain, and extends the obligations therein contained to all the nations at war.

To determine what constitutes a blockaded port, this denomination is confined to those the entrance into which is manifestly rendered dangerous in consequence of dispositions made by the attacking power with ships stationed and sufficiently

by a treaty which Russia made with the other members of the league, the following were the binding principles:

That the cargo of a neutral ship, though the property of an enemy, should not be seized unless the vessel be found laden with a larger quantity of articles contraband of war than is necessary for the use of the voyage.

2. That no merchandise should be deemed contraband of war but such as is actually used in war.

3. That nothing should be carried into the port, or city of one belligerent while blockaded, or shut so closely by the ships of war or batteries of the nation, that a merchant vessel could not attempt to enter without danger.

These principles were communicated formally to the powers at war, together with a statement that the league had determined to maintain these principles by arms if necessary.

In 1800 the armed neutrality of 1780 was revived and several additional powers were added to the principles of the league. The methods taken to enforce the armed neutrality were convoy and squadrons cruising in the vicinity of the commerce as it was their duty to protect.

On May 16, 1797, John Adams, then President of the United States, addressed a message regarding the protection of American commerce at sea. The orders of office to her cruisers were to seize all vessels carrying goods of British manufacture, no matter whether these goods were then owned by neutrals and in neutral hands or not. President Adams stated in his speech that he entertained no doubt of the propriety of the policy permitting vessels to employ means of defense while engaged in lawful foreign commerce. He said further: "It remains for Congress to prescribe such regulations as will enable our seafaring citizens to defend themselves against violations of the laws of nations, and at the same time restrain them from committing acts of hostility against the powers at war."

At the same time the President asked for increase in naval forces to give additional security to American commerce at sea. As a result of the President's request, Congress passed a law authorizing employment of force for the protection of commerce. The provisions of the law found expression in the instructions of the Secretary of the Navy to armed vessels. These instructions were as follows:

JOHN ADAMS,

President of the United States:

Instructions to the commanders of armed vessels belonging to the United States, given at Philadelphia the 10th day of July, in the year of our Lord one thousand seven hundred and ninety-eight, and in the twenty-third year of our independence.

In pursuance of the acts of Congress, passed the 28th day of May, the 28th day of June, and the 9th day of July:

You are hereby authorized, instructed, and directed to subdue, seize, and take any armed French vessel, or vessels, sailing under authority or pretense of authority from the French Republic, which shall be found within the jurisdictional limits of the United States, or elsewhere on the high seas; and such captured vessel with her apparel, guns, and appurtenances and the goods and effects which shall be found on board the same, together with all French persons and others, who shall be found acting on board, to bring within some port of the United States; and also to retake any vessels, which may have been captured by any French vessel—in order that proceedings may be had concerning such capture or recapture in due form of law, and as to right shall appertain.

By command, etc.,

(Signed)

BEN STODDART.

From letters to officers of ships of war, volume 1, 1798.

Instructions to the commanders of armed vessels, belonging to the United States, given at Philadelphia, this 28th day of May in the year of our Lord, 1798, and in the 22d year of the independence of the said States.

Whereas it is declared by an act of Congress, passed the 28th day of May, 1798, that armed vessels, sailing under authority or pretense of authority from the French Republic, have committed depredations on the commerce of the United States, and have recently captured the vessels and property of citizens thereof, on and near the coasts, in violation of the law of nations and treaties between the United States and the French Nation;

Therefore, and in pursuance of the said act, you are instructed and directed to seize, take, and bring into any port of the United States, to be proceeded against according to the laws of nations, any armed vessel sailing under authority or pretense of authority from the Republic of France, which shall have committed or which shall be found hovering on the coasts of the United States, for the purpose of committing depredations on the vessels belonging to citizens thereof; and also to retake any ship or vessel of any citizen or citizens of the United States which may have been captured by any such armed vessel.

By command,

From letters to officers of ships of war, volume 1, 1798.

ARMING MERCHANT VESSELS.

The right of merchant vessels to arm is a survival of the ancient practice of arming all merchant vessels as a protection against the piratical acts of other vessels or of irresponsible communities.

The arming of merchant vessels, not holding letters of marque, has been generally a private act. The convoy of merchant vessels is a public act. Armed neutrality is a public act in which the neutral engages to maintain by force if necessary his rights against any or all belligerents. Armed neutrality has the sanction of international law in so far as it seeks to support the principles of international law, but it is a measure founded on the decision to use force rather than diplomacy.

As one of the methods of using force is convoy, the following rule of convoy is pertinent:

"Neutral vessels under convoy of vessels of war of their own nationality are exempt from search. The commander of the convoy gives orally or in writing at the request of a commander of a belligerent ship of war, all information as to the character of the vessels and their cargoes which could be obtained by visit and search."

From the foregoing it will be seen that arming merchant vessels and armed neutrality are not the same unless the armed forces of the Government participate in the arming of merchant vessels. The duty of the Government, in the latter case, is obviously to announce the principles that shall govern its armed neutrality, and to announce further that these principles are applicable alike to all belligerents.

Armed neutrality does not do away with the belligerent right of visit and search. Resistance to this right by the armed forces of the Government, no matter where those forces may be, is an act of war.

Following that, and previous to the declaration of war, seeing that it was impossible to have our neutrality respected, the problem of placing armed guards on ships was done. It might be a violation of neutrality, but it was at that time a necessity, and as war did flow shortly afterwards, I suppose no question could be raised. The complete plan for that, in many pages, I will submit.

When it became necessary later to make use of more guns than we had in reserve, it became necessary to evolve another plan, which is likewise done, and I will read it, whereby we could strip ourselves a little more than we had done, and take those guns which we considered would not be needed, from our heavy naval ships, our second line of battleships, and place them on the merchant ships for the simple reason that there would be no probability of our second line battleships being called upon to engage with the enemy and there was every probability of the merchant ships which needed to supply our troops, having to pass through the war zone and come in contact with the enemy's submarines, and possibly with the enemy's raiders. This plan is as follows:-----

ARMED GUARD PLAN—ESTIMATE OF THE SITUATION.

ARMING MERCHANT VESSELS WITH NAVAL GUNS FOR DEFENSE.

(Commander W. Pitt Scott, U. S. N., Mar. 1, 1917.)

The international situation has been growing steadily worse and has resulted in a breaking off of the diplomatic relations of this country with Germany, with the prospect of an actual state of war rapidly increasing.

It has been decided to arm merchant vessels with naval guns for defense. Our decision is made. The problem that now confronts us is as to how we are to accomplish this in other words, to prepare a plan.

It may then be stated as our:

Mission.—To prepare a plan for arming our merchant vessels with naval guns for defense, including rules for conduct of ships and personnel.

In considering this problem the procedure will be considerably facilitated if the arrangements are discussed in their logical sequence, viz: (a) What vessels are to be armed; (b) How to arm them; (c) How to man the guns; (d) Rules for conduct of merchant ships; (e) Rules for officers and men of naval service if assigned to duty on merchant vessels; (f) Rules for masters of merchant vessels to which naval gun crews have been assigned.

Enemy forces.—Their strength, disposition, and probable intentions.

Strength.—The enemy forces that are a menace to our merchant vessels are limited to German and Austrian submarines, with the possibility of a detached surface raider; and under the present conditions, the menace of this latter may be considered as of less moment.

The number of German and Austrian submarines is unknown. The number that this country had at the beginning of the war is useless in forming an estimate of their present number, as reports from German sources as to the immense number built since the war began, and from British sources as to the immense number sunk or captured, are too vague to warrant close estimation. From the best information obtainable, it is probable that Germany and Austria combined have no less than 250 submarines. As Germany's policy is understood to be to relieve her submarines on every two weeks for rest and overhaul, it is probable that the actual number available at any one time is considerably less than one-half this number. Were the scene of operations shifted to the American coast, the number that would be available would be enormously reduced, even though it is possible mobile submarine bases could be established.

The German U-boats have a radius of at least 6,000 to 7,000 miles, have a surface speed up to 18 knots, and a submerged speed of 10 to 12 knots.

While the earlier boats are armed with lighter guns, their latest boats are armed with guns up to 4-inch.

Disposition.—At the present time it is probable that the submarine strength of Germany is concentrated in and about the "forbidden zone," the area decreed by Germany as surrounding England and France, and in the Mediterranean.

Probable intentions.—Germany has officially announced her intentions of stopping with every available weapon and without further notice all sea traffic in certain designated blockade zones around Great Britain, France, Italy, and in the eastern Mediterranean. While the sailing of regular American passenger vessels may be continued, they are permitted—by Germany's decree—to do so only under such obnoxious and limiting stipulations that no attention can be paid to them.

It is therefore Germany's probable intention to sink all vessels that enter this forbidden area.

Owing to the expense of each torpedo and the submarine's limited carrying capacity of this weapon, it is probable the enemy will endeavor to accomplish, as far as possible, her task by gunfire.

OUR OWN FORCES—STRENGTH, DISPOSITION, AND COURSES OF ACTION OPEN TO US.

Strength.—The guns that may be used for our purpose may be considered under two classes: (a) Those guns of 6-inch caliber and below that are now available, i. e., unmounted and in reserve; (b) those of similar caliber that are now mounted on board ship but which, owing to improved methods of fire control, are of little military value and might be spared for our purpose.

In considering the number of guns that are available for our purpose it must be borne in mind that the problem before us is not an independent one, and that the two classes of guns above enumerated are already assigned to other necessary purposes in a certain contingency, in case we enter into a state of war. In this contingency

the guns of class (a) have already been assigned under a mobilization plan, and guns of class (b) would be urgently needed in providing batteries for patrol and auxiliary vessels.

It can not therefore be assumed that the above reserve guns can be utilized entirely for our purpose, but our present problem must be coordinated with the necessities of the future, and it becomes a question of policy as to how far we may proceed in completing our stock of reserve guns to accomplish our immediate purpose.

The guns of class (a) are reserved for batteries of merchant vessels that would be taken over as auxiliaries in case of war. These are assigned as per the attached summary of which is as follows: 30 6-inch, 83 3-inch, 85 5-inch, 124 6-pdr., 159 4-inch, 160 3-pdr., or which may be summarized according to their present location, as follows:

| | 6-inch. | 5-inch. | 4-inch. | 3-inch. | 6-pounder. | position. |
|-----------------------|---------|---------|---------|---------|------------|-----------|
| New York..... | 22 | 36 | 81 | 57 | 16 | |
| Norfolk..... | 8 | 16 | 44 | 16 | | |
| Boston..... | | 4 | 4 | | 4 | |
| Philadelphia..... | | 16 | 8 | 1 | 4 | |
| Washington, D. C..... | | 5 | | | 48 | |
| Charleston..... | | | 4 | | 28 | |
| Portsmouth, N. H..... | | | 4 | | 8 | |
| Newport..... | | | | 2 | | |
| Mare Island..... | | 8 | 14 | 8 | 1 | |
| Puget Sound..... | | | | | 8 | |
| Olongapo..... | | | | | 8 | |
| Total..... | 30 | 85 | 159 | 83 | 124 | |

Of the above, 4 6-inch, 9 5-inch, 23 4-inch, 50 6-pounder, and 53 3-pounder are at present unassigned.

The guns of class (b) are not immediately available and after it was decided that no guns could be spared from the present ships' batteries it would probably be some time before they could be utilized.

Disposition.—The disposition of our available guns is given in the preceding table.

Courses of action.—If it appears to be impracticable to arm all American vessels then the questions of what vessels to arm, and how to arm them, must be a question of policy, giving precedence to those vessels that more urgently need this defense and to those that will best serve the interests of this country by having this defense. Primarily these vessels are to be armed for defense against German, and possibly Austrian, submarines as a result of Germany's decree of establishing a forbidden zone around England and France. This then may be considered the area of greatest menace if not the only area in which for the moment American ships will need defense. Ships then sailing for points in the forbidden zone or traveling through that area should be given precedence, omitting for the present and until more guns are available all others, though should the present broken relations with Germany develop into a state of war those vessels engaged in the coast trade and those sailing to West Indian and Gulf ports, would demand and would require equal consideration with those sailing for the forbidden zone.

A further factor that should govern in determining what vessels should be given precedence in arming for defense is a consideration of those vessels for which batteries have already been assigned in case of mobilization. If so now armed for defense with their assigned batteries for mobilization, or with a part of those batteries, less additional arming would entail when the further necessity arose.

It must further be considered as a question of policy as to what vessels would be immediately taken over in case of war. Many of the vessels now listed would, of course, not be taken over at once. The larger and faster vessels listed as suitable for scouts and to which the heavier batteries have been assigned, would, by their nature and by the necessity of maintaining supplies to the Entente Powers, probably be maintained in their merchant capacity for as long a time as possible.

From an inspection of the mobilization sheets and the assignment of batteries in case of war it appears that the only regular trans-Atlantic carriers that are listed for assignment of batteries are the five large vessels of the International Mercantile Marine. Other vessels listed for batteries are those engaged in the coast trade or trade to the Pacific Ocean and Gulf ports. A great many not listed for batteries are engaged in cargo trade to such ports as will best serve their interests. It is to this class that our attention must be given, and our furnishing batteries to them—considering our present limitations.

apply—must depend on their number, as they have no regular routes, decision must be based on their application.

It would appear then that our estimate as to:

a. What vessels to arm, is:

1. Regular transatlantic carriers, those listed as suitable to be taken over in time of war, and to which batteries have already been assigned.

2. Cargo carriers that apply for this defense, stating they intent to travel through the forbidden zone.

To be a real defense these vessels must be armed with a weapon of sufficient power and range to cope with a vessel by which they are likely to be attacked. We know that the latest German U-boats have guns of 4-inch caliber. A vessel equipped with a battery only of lesser caliber and of sufficient speed would be powerless against a U-boat carrying this weapon, which could stand off out of our range and sink at will. It must be borne in mind, however, that it is only their latest boats that carry this heavier gun, and that which would not be a defense against their latest boats would be a defense against many that might be encountered. Further, it is known that these boats approach, as a rule, to close range to avoid wasting any torpedo, and while their 4-inch gun may outrange a 3-inch or a 6-pounder, or a 3-pounder, the submarine is far more vulnerable to a lighter gun at short range than is the larger vessel to a heavier gun at the same range.

With our limited supply it will be advantageous therefore to utilize all the guns we have available, though it is not believed that guns of less than 3-pounder are desirable. The possibility of any efficiency of a lesser weapon is more than offset by the need of personnel that would be necessary to man it.

It is probable that the latest German U-boats are assigned almost exclusively to the area around Great Britain and France, leaving to the Austrian boats the attacks in the Mediterranean, and on the presumption that the Austrian boats are less efficient and of a lesser development, precedence in assigning the heavier batteries available should be given to those sailing through northern zones.

While certain batteries have been assigned to vessels in case of mobilization, and it is desirable to retain these batteries for this purpose, yet these batteries are in the case of the larger vessels assigned for offensive rather than defensive purposes and for this latter purpose do not need the full battery assigned for the former. While a more effective defense would be to mount four guns on each vessel, one in the bow, one astern, and one on each beam, owing to the limited supply it is believed a fairly efficient defense could be maintained by mounting two guns provided these can be mounted so as to cover an arc from ahead or astern to abaft, or ahead of the beam, especially so in the case of any but the larger vessels.

Our estimate, then, as to (b) "How to arm them," is:

1. Assign two guns to each vessel, except in the case of the larger vessels, where four should be mounted, if the supply permits. (2) Assign, as far as practicable, these guns to the same vessels to which they are already assigned under mobilization plans. (3) Give precedence in assigning the heavier calibers to those vessels whose travel takes them through the northern zones in preference to those taking the Mediterranean routes.

The estimate as "How to man the guns" resolves itself into two questions:

a. Who are to man the guns? (b) What number should or can be assigned to each gun?

The first of these, "Who is to man the guns?" brings forth a question of policy as to whether they should be manned by trained men of the Navy or whether by men secured by the steamship companies themselves, both of which considerations are influenced by the lack of trained men.

Should it be decided to man these guns by regularly enlisted men of the Navy, opportunity may be given to Germany to claim that these vessels are offensively armed vessels and in the Government service, but this should have no weight in our decision, for such a claim should insure them only greater immunity from attack as long as there is no actual state of war, and in that case it is immaterial what their status is as far as Germany's probable action would be. The present state of our international relations has reached such a point that it is incumbent upon us to formulate our own policy without fear of giving affront on a purely technical point which, from our own point of view upheld by international law, is thoroughly justified.

The question of policy as regards taking trained men from the fleet is, however, worthy of more consideration from the viewpoint of the shortage of these men that now exists. The Navy is already seriously handicapped by the lack of personnel, and the greatly increased demands that will be necessary in case of war presents a serious problem if this shortage is to be further depleted to furnish guns' crews for merchant vessels.

On the other hand to make this defense effective requires trained men, and it has been demonstrated that the steamship companies have so far either been unable or unwilling to obtain them. It is undoubtedly their right to demand protection from their Government.

It has been said that in time of war there would be no difficulty in recruiting men for the Navy. This is probably so, but in coming to this conclusion, while no doubt these men would be largely influenced by patriotism, were the psychology considered it would undoubtedly be found that this desire for excitement plays its part. Many men hesitate to enlist for a four-year enlistment with the prospect of four years' routine but would willingly do so if they had the certain prospect of something doing. Were patriotism the only influence, these men would be enlisting in large numbers now when their services are urgently needed for the benefit of their country.

As this question of arming merchant ships now looms large before the public, and this duty offers the possibilities of excitement and "fame" it is believed that many men could be immediately enlisted on short-term enlistment for this particular service. Many trained ex Navy men who are now awaiting developments will no doubt be immediately attracted.

As however trained men are immediately necessary, there is no other solution than to provide these men from the present enlisted force of the Navy. As it is however of the utmost importance to return these men to their present duties at the earliest moment, steps should be taken to immediately secure men to replace them. The first step in this direction would be to obtain legislation authorizing a short term (one year) enlistment for this particular service. As rapidly as men were recruited they would be given naval training in gun pointing and the service of the piece. Their entire time devoted solely to this particular training should qualify these men in a comparatively short time and as rapidly as they qualified they would be ordered to this duty; it will be noted as previously referred to, that it will be impracticable to arm all vessels immediately, and many will have to wait depending on the urgency of their needs, and until guns and personnel are available, so that this method has an additional advantage in that it will furnish a progressive system of supplying this personnel without the necessity of constantly calling away trained men of the fleet.

Should it be found less desirable to actually enlist these men in the Navy than to recruit them for the steamship companies, arrangements might be made with the companies to recruit their men for them, give them the proper training, and then turn them over to the companies. While this would be cheaper for the Government and would perhaps simplify the control of the master over these men, it is believed not to be as desirable as actually enlisting them.

The questions of furnishing officers to command detachments on these vessels is subject to the same remarks as above as regards the present shortage in the Navy with the less apparent necessity of supplying them.

As the repelling of a submarine attack will usually be at a comparatively short range, if not often at nearly point-blank range, if trained personnel man the guns, the service of an officer to direct and control the fire is much less necessary than if longer range firing were anticipated.

If trained personnel are assigned to these guns it is not believed necessary to spare an officer to give them further training, and a realization of the menace to which they are exposed would be their best incentive to keep on the job.

Therefore, from the viewpoint of training, keeping the crews in shape or from directing and controlling the fire, it is believed it is not necessary to assign an officer to this duty.

Were sufficient officers available, it would appear desirable to assign an officer as the representative of the Government to avoid committing any unneutral or belligerent act or unwarrantably involving the country in international complications; but were an officer assigned for this purpose it must needs be an officer of some experience and well versed in international law, and considering the present great shortage of officers, it is not believed the situation warrants the taking away of officers from other urgent duty for this purpose.

Our estimate then as to who are to man the guns, is—

1. Immediately: Trained enlisted men of the Navy. 2. Specially enlisted short-term men, and when these are qualified, these men to replace the regularly enlisted men. 3. No officers to be assigned.

As the total number of ships that will be immediately armed can not for the moment be gauged, it will of course be impossible to estimate the total number of men required, but six is the minimum number that can effectively serve a gun of 6-inch, 5-inch, 4-inch, or 3-inch (these would include, pointer, trainer, sight setter, plugman, shellman, and powder man or extra shellman), and four is the minimum that can likewise serve a 6-pounder, or 3-inch.

On this basis, and considering solely the guns now available in reserve and unassigned, 668 men will be immediately necessary. Assuming that one petty officer will be assigned to each gun 149 of the above will be petty officers.

Our estimate, then, as to the number of men is—

(a) One petty officer and five men to be assigned to each gun of 6-inch, 5-inch, 4-inch, and 3-inch caliber; (b) one petty officer and three men to be assigned to each 6-pounder, and each 3-pounder; (c) immediate requirement 149 petty officers and 519 men; (d) additional men to be trained solely for this duty as rapidly as practicable.

PART II—RULES FOR CONDUCT OF MERCHANT SHIPS.

FOREWORD.

(Commander W. Pitt Scott, Mar. 3, 1917.)

The arming of merchant vessels with naval guns for defense being solely for the protection of those vessels while engaged in their legitimate commerce, this purpose must never be lost sight of and must be rigidly adhered to. For this reason all measures of an offensive nature must be refrained from unless actually attacked. But considering the circumstances under which this defense has become necessary it may be well to consider what may be construed as an actual attack.

Germany has developed her warfare to the point where she has practically abandoned the principle of visit and search and has inaugurated a policy of sinking all ships of her antagonists, often without even a warning, and has similarly sunk many neutral nations.

Within the past month she has extended this policy by officially announcing her intentions of "stopping with every available weapon and without further notice all sea traffic" in certain designated zones, which extend for several hundred miles seaward of England and France. This then may be taken as sufficient notice of her intention to sink all vessels in that area.

It is to be expected that practically all ships that we are intending to arm for defense are engaged in carrying contraband. This, though within their legitimate rights, subjects them to condemnation if overhauled and subjected to a lawful visit and search. Owing to Germany's position and the nature of her warfare, condemnation of a prize means her sinking.

In the eyes of international law armed resistance of a neutral merchant ship to one of the belligerent armed vessels differs from the resistance of an enemy's merchant vessel in that the former is an act of war, while the latter (the two countries being already at war) merely subjects her to the consequences. Therefore, it can make little difference to us in the consequences whether we resist an attack after the submarine has opened fire upon us or whether we make that resistance immediately.

Therefore, when we arm these vessels for defense, knowing that they contemplate carrying contraband, and, therefore, subject to being sunk if apprehended, we take the position that we are arming these vessels for resistance against being sunk.

Owing to Germany's methods and to her announced intention of sinking all vessels in the forbidden zone, in order to make our resistance effective an "attack" must be construed literally. Therefore, a "threat" by a submarine, either by actually firing at our vessel or by its approach and menacing attitude, must be considered an attack.

RULES.

1. Every effort should be made to avoid meeting hostile submarines.
2. If a submarine is sighted course should be changed so as to give it as wide a berth as possible. If sighted ahead, course should be changed 90°.
3. If a submarine approaches, change course to bring the boat astern and proceed at full speed.
4. If the submarine is submerged fast ships can considerably reduce the chance of a successful torpedo attack by zigzagging.
5. Have sharp lookouts kept at all times, particularly from ahead to abaft either beam.
6. Speed being one of the best defenses against submarine maximum speed should be used when passing through the forbidden zone.
7. Provisions will be made for darkening ships and when passing through the forbidden zone, ships will be completely darkened, including all navigational lights.
8. Advantage should be taken of the protection afforded by the Allied patrol fleet as far as information of their protected lanes is communicated.

9. Radio will not be used either to send or to acknowledge a call, except in the presence of a hostile submarine it becomes necessary to summon assistance.

10. Observe all signals of the English and French patrol boats.

11. American colors will be conspicuously displayed during the daylight.

12. Great care and judgment must be exercised in initiating an attack on submarines. Fire on a submarine will not be opened unless the submarine fires first or unless it is evident that she contemplates doing so either with gun or torpedo. In no case will fire be opened at a range exceeding 3,000 yards unless the submarine herself opens fire at a greater range.

13. Secrecy should be maintained as to the route to be taken.

14. All suspicious looking vessels should be given a wide berth. Instances have been noted where German submarines have been disguised as small steamers and converted merchantmen have been fitted with torpedoes.

RULES FOR OFFICERS AND MEN OF THE NAVAL SERVICE IF ASSIGNED TO DUTY ON MERCHANT VESSELS.

Policy.—If a naval officer and enlisted men of the Navy are assigned to a merchant vessel for its defense, it is necessary to so define the authority of both the master of the ship and of the naval officer that there can be no question of a conflict of authority.

By existing law the master of a merchant ship is supreme in his command on the high seas and no part of that authority or responsibility can be withheld from him except by legislative act, nor does it appear desirable to do so. If a naval officer is assigned to one of these vessels either to represent the Government or to maintain the efficiency of the gun battery and personnel, he must either be placed in full command of the vessel or be entirely subordinate to the master. From the viewpoint of the Government and from that of the company, the former is not desirable, though if we enter into a state of war it will doubtless later be found necessary or desirable to place each of these vessels under command of a naval officer or one sufficiently acquainted with naval plans and procedure as to be able to coordinate his movements with naval procedure. The naval officer therefore, if, under present laws, assigned to one of these merchant vessels, must be subordinate in all respects to the master, can have no independent authority, but will be charged with certain responsibilities in regard to the battery and naval personnel.

RULES.

1. The naval officer assigned to duty on merchant vessels armed for defense will be under the orders of the master of that vessel.

2. He will have direct supervision over the ship's battery and all appurtenances thereof, and will be directly responsible for its efficiency.

3. He will have direct supervision over the enlisted personnel of the Navy assigned to that vessel and will be responsible for its training and efficiency.

4. He will issue such orders as will insure the battery and personnel being ready to repel a submarine attack at a moment's notice.

5. The Navy personnel are not required for duties unconnected with the armament except in case of emergency.

6. The naval officer will arrange with the master to detail additional men of the ship's company to assist in completing the gun's crew.

7. He will arrange with the master times when these additional men will be available for instruction and training.

8. He will make such reports as are necessary direct to the Navy Department.

9. He will consult with the master and advise him in all matters regarding the repelling of an attack and the procedure thereof.

RULES FOR MASTERS OF MERCHANT VESSELS TO WHICH NAVAL GUN CREWS HAVE BEEN ASSIGNED.

1. The master is in sole command of his vessel.

2. He will not interfere with the duties assigned to the personnel of the Navy assigned to his vessel for manning the defense guns.

3. He will be responsible for opening and ceasing fire upon a submarine, but he will consult with and be advised by the naval officer upon these actions.

4. After fire has been opened upon a submarine and until he gives the order to cease fire, he will in no way interfere with the management of the piece nor with the direction or control of the fire.

5. He will keep the naval officer fully informed as to the ship's movements and of his procedure when passing through menaced waters.

6. He will issue all orders to personnel through the naval officer.

(Confidential.)

REGULATIONS GOVERNING THE CONDUCT OF AMERICAN MERCHANT VESSELS ON WHICH ARMED GUARDS HAVE BEEN PLACED.

1. Armed guards on American merchant vessels are for the sole purpose of defense against the unlawful acts of the submarines of Germany or of any nation following the policy announced by Germany in her note of January 31, 1917. Neither the armed guards nor their arms can be used for any other purpose.

2. The announced policy of Germany, in her note of January 31, 1917, to sink all vessels that enter certain areas of the high seas, has led the Government of the United States to authorize armed guards on merchant vessels to resist any and all attempts of the submarines of Germany or of any nation following the policy announced by Germany in her note of January 31, to put that policy into practice.

3. It shall be lawful for the armed guard on any American merchant vessel to fire upon any submarine of Germany or of any nation following the policy of Germany announced in her note of January 31, 1917, that attempts to approach, or lies within 4,000 yards of the commercial route of the vessel sighting the submarine, if the submarine is sighted within the zone proscribed by Germany.

4. No armed guard on any American merchant vessel shall fire at any submarine that lies more than 4,000 yards from the commercial route of the vessel sighting the submarine, except that the submarine shall have fired first.

5. No armed guard on any American merchant vessel shall take any offensive action against any submarine of Germany or of any nation following the policy of Germany announced in her note of January 31, 1917, on the high seas outside of the zones proscribed by Germany, unless the submarine is guilty of an unlawful act that jeopardizes the vessel, her passengers, or crew, or unless the submarine is submerged.

6. No armed guard on an American merchant vessel shall attack a submarine that is retiring or attempting to retire either within or without the zone proscribed by Germany, unless it may be reasonably presumed to be maneuvering for renewal of attack.

7. In all cases not herein specifically excepted the armed guard on American merchant vessels shall be governed by the principles of established international law and the treaties and conventions to which the Government of the United States is a party.

8. American merchant vessels are forbidden to pursue or search out the submarines of any nation or to engage in any aggressive warfare against them.

9. American merchant vessels shall make every effort compatible with the safety of the merchant vessel to save the lives of the crew of any submarine that may be sunk, or that submits, or is in distress.

10. This paragraph stricken out.)

11. This paragraph stricken out.)

12. American merchant vessels should communicate with the commandant of the naval district before leaving a United States port to make sure of the latest information.

13. The safety of American merchant vessels requires that they obey all instructions of vessels of war of the United States.

ON SIGHTING A SUBMARINE IN THE PROSCRIBED ZONES.

14. If a submarine is sighted beyond torpedo range, bring submarine abaft the beam and keep her there. If submarine attempts to close, bring her astern and proceed at highest possible speed.

15. If submarine is sighted close aboard forward of the beam, the greatest safety lies in changing course directly toward the submarine.

16. If submarine is sighted close aboard abaft the beam, the greatest safety lies in turning away from the submarine and proceeding at highest speed.

ON OPENING FIRE IN DEFENSE AGAINST THE UNLAWFUL ACTS OF SUBMARINES.

17. Hoist national colors before first shot is fired.

18. Once it has been decided to open fire, do not submit to the gunfire of a submarine so long as the armed guard can continue to fire.

19. Send all persons except bridge force and the armed guard below decks while vessel is under fire.

20. Watch out for torpedoes and maneuver to avoid them. If unable to avoid them, maneuver so that they will strike a glancing blow.

THE ARMED GUARD.

21. The armed guard is commanded by the Senior Naval Officer on board. He shall have exclusive control over the military functions of the armed guard and shall be responsible for the execution of all the regulations given herein governing the employment of the armed guard.

22. The military discipline of the armed guard shall be administered by the naval officer commanding the armed guard.

23. The armed guard shall be subject to the orders of the master of the merchant vessel as to matters of nonmilitary character, but the members of the armed guard shall not be required to perform any ship duties except their military duty, and these shall be performed invariably under the direction of the officer commanding the armed guard.

24. The decision as to opening fire or ceasing fire upon any submarine shall reside exclusively with the naval officer commanding the armed guard.

25. The enlisted personnel of the armed guard shall be quartered and messes together on board both in port and at sea, at the expense of the owners of the vessel on which the armed guard is serving, in a manner satisfactory to the naval officer commanding the armed guard.

26. The naval officer commanding the armed guard shall take precedence next after the master, except that he shall not be eligible for succession to the command of the ship. He shall be quartered and messes on board both at sea and in port, at the expense of the owners of the vessel on which he is serving, and in a manner appropriate to his precedence next after the master.

27. The master of the merchant vessel shall, on request of the commander of the armed guard, detail members of the crew to handle ammunition, clear decks, and otherwise supplement the service of the gun.

28. The naval officer commanding the armed guard shall be responsible for—

- (a) The condition of the battery and its appurtenances.
- (b) The training of the guns' crews and spotters, including members of the ship's force detailed by the master to assist in the service of the guns.
- (c) The readiness of the ship's battery at night.
- (d) The readiness of the armed guard to perform its duties at all times.
- (e) The continuous lookout near each gun by a member of the armed guard.
- (f) The making of all reports required by the Navy Department.

JOSEPHUS DANIELS,
Secretary of the Navy.

MARCH 13, 1917.

ARMING MERCHANT SHIPS—ESTIMATE OF THE SITUATION.

PROBLEM.

General situation.—The present situation.

Special situation.—It has been decided to arm merchant vessels with naval guns for defense.

Required.—Estimate of the situation as to (a) what vessels to arm; (b) how to arm them; (c) how to man the guns; (d) rules for conduct of merchant ships; (e) rules for officers and men of naval service if assigned to duty on merchant vessels; (f) rules for masters of merchant vessels to which naval guns crews have been assigned.

Preliminary.—In considering the question of arming merchant vessels there are three directions which our effort may take: (1) arm merchant ships generally, irrespective of their prospective employment; (2) arm merchant ships that have been listed as naval auxiliaries in accordance with mobilization plans; (3) arm merchant ships that are to traverse the so-called forbidden zones.

The following facts must be considered as a preliminary to the solution of the problem of arming merchant vessels:

(a) The problem assumes that the policy of arming merchant vessels has been determined upon. It is, therefore, not made the subject of comment here.

(b) Merchant vessels can not be armed in any considerable number, or effectively, without Government aid. The Government can aid in one of two ways: (1) by selling guns to shipowners, or (2) by placing Government-owned guns at the disposal of shipowners. The difference in these two methods, so far as the international aspect is concerned, does not appear material to me. The Government, in either case, is an active party to the act, and thereby becomes measurably responsible for the subsequent use to which the

The arming of merchant vessels by naval guns will probably result in the guns being used against submarines, which in turn will probably lead to war.

Although war may not result from the present situation, it appears so probable that all steps of a military nature, involving a distribution of our forces, or of our military resources, must be taken in such a way as to harmonize with the requirements of the kind of war that now seems most probable.

A previous general estimate of the situation deduces that if war is declared our interests demand that our immediate mission shall be "To render the maximum possible naval support now to the enemies of the Central Powers." In the examination of the way to accomplish the above mission the following decisions relating to merchant vessels were arrived at: "To assist in arming merchant vessels and in training gun crews for all merchant vessels engaged in the trans-Atlantic trade with the Entente Powers." "To mobilize shipping by subsidy into the trans-Atlantic trade, where necessary to increase traffic with cooperating powers." "To make the minimum possible demands on cargo vessels of the merchant marine for military service."

The total number of ocean-going merchant vessels (Great Lakes not included) in the United States is about 550.

The total number of sea-going yachts that might be available for arming and which might have to be armed in war against submarines is over 100.

The local patrol of the New York approaches will require a minimum of 100 armed vessels—yachts, tugs, and motor vessels.

The total number of guns now available for mounting on vessels of all classes is: 1-inch, 32; 5-inch, 84; 4-inch, 176; 3-inch, 88; 6-pounder, 136; 3-pounder, 188.

Of the vessels to which batteries are assigned for general mobilization purposes there are but five vessels engaged in the trans-Atlantic trade at present. These vessels are the *St. Louis*, *St. Paul*, *New York*, *Philadelphia*, *Kroonland*, and *Finland*. In other words, of the entire number of guns available for mounting but 28 would be in immediate active use in the defense of trans-Atlantic commerce if merchant vessels were armed in accordance with present mobilization plans.

From an examination of the above facts we are led to the unavoidable conclusion that if merchant vessels are to be armed with a view either to their own safety or with a view to permitting their free use of the so-called forbidden zones, or with the view of supporting the Entente Powers, or with a view of furthering our national aims, we should arm first those merchant vessels which are to traverse the so-called forbidden zones.

So soon as we adopt the arming of merchant ships as a principle we have to realize the special helplessness of unarmed vessels in the presence of submarines that are making war on us. Joining this consideration to the alarming shortage of ships and the necessity of merchant ships for our success in the war, I conclude that American ships should not thereafter be permitted to enter the areas of great danger until they are armed.

If merchant vessels are to be armed for defense the question is what constitutes "armed for defense." The reply must be adjusted to the ruling of the authorities in the ports that the armed merchant vessels are to visit. So far as the Entente Powers are concerned we can be certain that there will be no restriction on the number of guns assigned any vessel, nor on their position on board. As the essential element is the safety of the ship and as the military situation requires that we concentrate our effort on support of the Entente Powers, and as the Central Powers have announced that they will sink armed merchant vessels wherever encountered, the solution of the question as to how arm merchant vessels is made entirely dependent on the method of arming that will give the merchant vessel the greatest possible offensive power against an attacking submarine.

As submarines may appear and may attack on any bearing, all-around-fire is important. The number of guns per ship is dependent upon the supply available.

The above decision as to arming merchant vessels is based upon the principle that the offensive or defensive character of a vessel's battery depends upon the use to which it has been or is intended to be put.

DECISION.

Distribute guns to vessels and mount them so as to give the greatest degree of protection to each vessel, no matter what direction from which it is attacked.

The actual assignment of guns to vessels can not be made until a list of vessels to engage in trade in or near danger zones is obtained, and until the desires of owners are ascertained.

There are two methods of manning guns placed on merchant vessels: (1) By guns crews drawn from the merchant crew of the vessel; (2) by naval guns crews.

When the Government places its own guns on privately owned vessels it accepts a certain responsibility for the use to which the guns are placed. In the period preceding war it is of importance that these guns shall not be used imprudently, or contrary to governmental policy. I believe that there can be no sure control of the use of the guns except naval control. Naval control is open to two objections:

(a) That it tends to alter the status of merchant vessels.

(b) That it makes a demand for personnel that it is very difficult to meet.

These objections must be considered in the light of the following facts:

Four trained men per gun and one or two officers per ship will ensure sufficient service of the guns.

Guns are not effective without trained crews. The chance of the successful defense of the ship would probably be more than doubled by having guns controlled by officers and men of the Navy.

For these reasons and because of the great importance of preserving and defending our shipping I recommend that guns on merchant vessels shall be manned and officered by the Navy.

RULES FOR THE CONDUCT OF MERCHANT VESSELS.

POLICY.

American merchant vessels are armed for the sole purpose of defense. Their armament can be used lawfully for no other purpose. The fact that a vessel sighted may be hostile or may have hostile intentions does not justify any hostile act on the part of a merchant vessel, but it does justify readiness to act. The merchant vessel may use its armament solely to resist attack, or to resist pursuit in a zone where it is the custom of vessels of the nationality of the pursuing vessel to sink American merchant vessels without warning. A vessel must discontinue the use of its armament as soon as the attacking vessel ceases to attack and to pursue.

INFORMATION.

Submarines have been known to disguise themselves as fishing vessels; disguise themselves as small steamers, showing smoke coming from their funnels; disguise themselves as sailing vessels; lay mines; lay mines that show a dummy periscope. The genuine periscope can be recognized by the fact that it does not bob about and wobble, and by the fact that it is in motion and leaves a frothy wake close aboard.

Submarines do not like to use their torpedoes, as they carry only a limited number. When these are exhausted they must lose time by returning for a new supply. They prefer the attack by gunfire. The arming of all merchant vessels and their unanimous determination to resist the surface attack of submarines will reduce losses by at least 80 per cent.

Submarines that attack at night are not submerged. A heavy rifle and machine-gun fire is very effective in beating off the attack.

Submarines are apt to operate near navigable channels from positions inside outlying shoals. They avoid shallow water.

Torpedoes can be set to float after a run; they then become mines.

Raiders are apt to be armed with torpedoes.

Shallow water by day is fairly safe except as to mines.

REGULATIONS.

1. Always communicate with commandant of naval district before leaving a United States port to make sure that you have the latest information and instructions.

2. Your safety requires that you obey all instructions from vessels of war of the United States or of friendly powers.

3. Keep your intended route secret but file it with your agent before sailing. Patrol vessels may prescribe your route to avoid new dangers, or to insure that too many vessels shall not follow the same route.

4. Sail near dusk or at hour designated by local authorities.

5. Make your landfalls at night.

6. Make port at dawn.

7. Lay your course through neutral water—within 3 miles of a neutral shore—wherever practicable.

8. Always proceed at highest possible speed when within 150 miles of land. Speed is an excellent protection against submarines.

- Make no entries in log concerning the sighting of any vessel of the United States or of friendly powers or concerning any communication received from such vessel.
10. Do not show navigational lights at night except to avoid collision. Keep ship thoroughly darkened.
 11. Fly no colors or house flag at sea except in presence of ships of war of friendly powers unless you are about to use your armament, in which case you must show your proper national colors before firing.
 12. If your vessel is armed, always fly your true colors in approaching and while passing through neutral waters.
 13. You may use false colors at sea subject to the restrictions given in above paragraphs.
 14. If you see a suspicious object in the water, do not watch it so hard that you will not see its possible mates near by.
 15. Paint out names and other distinguishing marks.
 16. Keep boats rigged out and ready for lowering.
 17. Never go to the assistance of a vessel that is being attacked or has just been attacked. Leave this job for small vessels.
 18. Sink all floating torpedoes found. Look out for the nose of a torpedo, as a moderate blow there will explode the torpedo. Never ram a torpedo, but sink it by gun fire or by sending a small boat alongside to attach a heavy load to the tail.
 19. Sink all mines sighted at sea, using rifle fire. High-velocity, small-bore rifles with steel bullets are best for this purpose.
 20. Never assume that a mine is safe. It is not.
 21. Report to the Navy Department, or nearest naval authorities, all mines, torpedoes, submarines, and suspicious objects that are encountered at sea. The report should give the following information:
 - a. Exact position in which sighted.
 - b. Date and hour.
 - c. Distance at which seen and examined.
 - d. Shape and general appearance.
 - e. Whether floating or moored.
 - f. What was done with object.
 - g. What did ship do?
 - h. Additional details and remarks.
 22. Always do your utmost to escape hostile vessels under all conditions. You will be sunk if you do not escape.
 23. Remember that submarines do not like to use their torpedoes, and that they are afraid of gunfire. So do not submit to the gunfire of submarines so long as you can fire your own guns.
 24. Passengers and noncombatant members of the crew can not lawfully engage in defensive operations except under the orders of the master or the officer in charge of the guns.
 25. When you sight a ship at sea, consider it as possibly hostile. Change course so as to insure that you will not close her unless she gives chase. In which case bring her astern and keep her there and send out calls for help.
 26. If a submarine is seen at a distance, or on the surface, or if periscope is seen, alter course to bring the submarine astern and keep it there and proceed at the highest possible speed. Do not stop because of gunfire of the submarine, but reply to it as effectively as possible.
 27. When your vessel is under fire, send all of the bridge force and the guns' crews below decks and be ready to stop leaks from shot holes. Always have in mind definite plans for listing the ship to bring holes near the water line out of the water.
 28. If the submarine does not use gunfire to bring you to, it is probably because she has no gun or else no ammunition.
 29. Always watch for torpedoes and maneuver to avoid them. The torpedo leaves a well-defined wake of bubbles and is slick, if the water is not too rough. If unable to avoid the torpedo, maneuver so that it will strike a glancing blow, as torpedoes sometimes fail when striking a glancing blow.
 30. If submarine attacks submerged from positions forward of the beam and close aboard, the greatest safety probably lies in changing course directly toward the submarine. If the attack is made from positions abaft the beam, the greatest safety lies in presenting the stern to the submarine.
 31. Always carry steam ready for a spurt of speed.
 32. Beware of decoy vessels making signals of distress.
 33. Zig-zagging in narrow waters is excellent protection against unseen submarines, as submarine can not easily get into position for attack.
 34. If capture is imminent destroy all documents, log books, papers, etc., by burning.
 35. Look out for explosives in taking fuel and cargo.

36. Inspect ship carefully before sailing to be sure that no job has been done re-
reptitiously that will make the ship unseaworthy.
37. Watch out for "accidental ramming" in neutral waters of vessels manned
enemy subjects.

FIRE-CONTROL RULES.

1. Hoist national colors before first shot is fired.
2. The master is responsible for opening fire, ceasing fire, and for the conduct of
persons engaged in the defense of the vessel.
3. The master must not fire on a vessel after she has indicated surrender.
4. The master is bound by the treaties and covenants to which the United States
is a party.
5. Keep guns in constant readiness, with ammunition at the guns.
6. Do not fire at a vessel at night unless attacked by that vessel.
7. The point of aim should be the center of the water line.
8. The guns' crews should aim so as to keep one-half of the shots falling short. Shots
that go over do no damage, while shorts, by throwing spray, interfere with the man-
vering of the submarine and its aim.

RADIO RULES.

9. If attacked, report broadcast in plain language, position and type of attack
vessel.
10. Arrange radio apparatus so that master will control absolutely the sending
messages.
11. Make sure of the loyalty of your radio operators.
12. Before leaving port, inquire specially for codes in which to report special
information by radio.

REGULATIONS CONCERNING NAVAL DETACHMENT ON MERCHANT VESSELS.

1. The master of a merchant vessel commands the vessel, her passengers, and crew.
The naval detachment is under the command of the master. They shall obey the
orders of the master and the regulations of the ship.
2. The naval officer commanding the detachment shall rank as an officer of the
ship next after the master, except that he shall not be eligible for succession to com-
mand of the ship.
3. The discipline of the naval detachment shall be administered through the naval
officer commanding the detachment.
4. The members of the naval detachment shall perform no duties except those con-
nected with the service of the guns and military lookout duty.
5. The enlisted personnel of the naval detachment shall be quartered and mess
together in a manner satisfactory to the naval officer commanding the detachment.

It was also necessary at this time to take into consideration what we should do at home to prepare ourselves for an adequate defense, and while the idea of defense was not a paramount idea, it had to be considered. The paramount conception of our naval districts was to so use our districts that they would be able to utilize to the full the facilities for repair and to coordinate these efforts with our fleet afloat, and particularly with the merchant ships which had to be taken over, which had to be repaired and supplied in order that the civil activities coming within the naval district could be coordinated with the needs of shipping. Our navy yards were supposed to look out particularly for the naval ships, but the civil industries within a naval district and the acts of taking over merchant ships had to be considered and operated through our naval districts. There is quite a plan here for organizing our naval districts, and attached to it I have the President's proclamation, called the commandeering act, allowing us to take over boats; also I have attached a list of ships in the naval districts, and also a list of ships which were commandeered for the purpose of sending abroad, and which were sent abroad, with the duties of selling and taking over, the price of them when taken, all quite complete.

The CHAIRMAN. Those were vessels all outside of the Navy?

Capt. PRATT. All outside of the Navy.

(These papers are as follows:)

NAVAL DISTRICTS, INCLUDING EXTRACTS FROM COMMANDEERING ACT, JUNE 15, 1917.

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, April 17, 1918.

From: Chief of Naval Operations.

To: Commandants first, second, third, fourth, fifth, sixth, seventh, eighth, ninth, tenth, eleventh, twelfth, thirteenth, fourteenth, and fifteenth.

Subject: Circular letter to all districts, amplifying General Order 372 of February 28, 1918.

1. In districts having within their boundaries a navy yard, all the industrial activities of the district will be under the head of the industrial organization of the navy yard. In the first district they will be under the head of the industrial activities of the Charleston yard except as to the industrial activities in the Portsmouth yard, which will not be disturbed.

2. All officers detailed to the district whose duties include industrial activities will be, so far as those activities are concerned, under the industrial control of the head of the industrial activities of the district.

3. The military control of the submarine base at New London is under the commandant of the district. (See Operation's letter of Apr. 15, 1918, 24514-846.8.)

4. Chief of Naval Operations' letter to commandants first, second, third, fourth, fifth districts, and others of January 9, 1918, paragraph 3, provides:

"The Bureau of Navigation will designate an officer to perform the local duties of district supervisor of the 'Naval overseas transportation service' for the first, third, fourth, and fifth naval districts. This office shall, under the direction of the commandant of the district, be charged with the duties of taking over necessary alterations, repairs, upkeep, and supply of all vessels of the 'naval overseas transportation service' coming in that district and the movements of the vessels within that district." (For this purpose the waters of the second district are considered as coming within the jurisdiction of the third district.)

5. The activities at the naval operating base at Hampton Roads, Va., have been placed under the commandant of the fifth naval district and made the subject of separate order, General Order 363 of January 28, 1918.

6. The Washington Navy Yard and the activities located on the Severn and Potomac Rivers including the naval air station, Anacostia, D. C., are affected by orders subsequent to General Order 372 of February 28, 1918, as follows:

C. N. O. Jan. 19, 1918, Op-Air 078-3.

C. N. O. April (28905-560), Op-14 4/8.

7. In the twelfth district conditions are affected by the following orders:

Secretary of the Navy letter to commander patrol force Pacific Fleet, May 25, 1917, directing him to assume general supervision of the twelfth, thirteenth, and fourteenth districts. This supervision not to be constructed as displacing the organization of naval districts or supplanting the naval district commandants in the performance of duty within their districts. Chief of Naval Operations letter of July, 1917 (278383-127), placing above duties upon the commander division 2, Pacific Fleet.

8. Marine detachments stationed or quartered at the navy yards will be under the immediate military control of the commandants of the yard and through the commandant together with other district activities under the military control of the commandant of the district.

9. Marine detachments stationed and quartered elsewhere within district limits will be under the military control of the commandant of the district.

10. The advanced base force at Philadelphia will be under the military control of the commandant of the district.

11. Attention is invited particularly to the provision of General Order 372 of February 28, 1918, directing that the naval activities in each district shall be organized under four heads.

W. S. BENSON.

(Copies to Bureaus of Steam Engineering, Op. Mat. Construction & repair, Op. Air. Yards & Docks, Naval Intel. Supplies & Accounts, Armed Guard. Navigation. Naval Communications. Ordnance, Capt-Commandant Coast Guard. Medicine & Surgery, Commandant, U. S. Marine Corps.)

FEBRUARY 20, 1918.

From: Secretary of the Navy.

To: Commandants of all naval districts.

Subject: Powers and duties of naval district forces in regard to protection of private plants, wharves, and water fronts.

The powers and duties of the naval district forces on the water and on shore in regard to guarding wharves, piers, and vessels lying alongside; private plants, State

and municipal property, and munitions and merchandise not on property under direct naval control, has been the subject of perplexity to the various district commandants and others having responsibilities in connection with these matters. The subject is a complicated one and the bearing and relative importance of the various elements involved subject to such sudden changes that it is not felt desirable, even if it were possible, to frame a series of definite rules to cover the various demands for such service. What is undertaken in this is rather to collect definite information as to what has been done, and how matters involving these questions have been handled and to point out a number of important considerations to be taken into account when dealing with such cases. It should always be kept in mind that the question of the power to act is to be considered in connection with the policy of the department as to how far and to what extent it is to be exercised, which is quite a different consideration. This policy is in a general way to become involved as little as possible with activities on land, or even within the harbors and inland waters, but to confine the activities of the district forces to duties which are primarily naval and, consequently, such as no other agencies are as well adapted to undertake—such as the patrol of the waters adjacent to the coast in watch for the activities of the enemy from the sea, searching and sweeping for mines, guarding nets and mine fields, directing the movement of vessels of commerce through mine fields and the defensive sea areas as established, the routing of vessels and assembling of convoys, placing of guards on vessels when necessary in their passage in and out of harbors, as a matter of cooperation with the Treasury Department, collecting intelligence of attempts against the safety of vessels at sea, and, a service to be considered of first importance, the training of the enlisted force in these duties, and so as to fit them for service on transports and vessels carrying war material.

2. The Government has divided the duties in connection with the defensive sea areas, and the coastal waters and harbor entrances, the control of shipping in the harbors and of the crews of merchant ships, their passengers and cargoes while in port, and the protection of the various activities along the shores and harbors from vicious acts on the part of alien enemies or others, between the Navy Department, Treasury Department, and the office of the Attorney General. The control of the anchorages and of merchant vessels and their crews, passengers, and cargoes while in harbor, is placed in charge of the Treasury Department, which will act through captains of the port in certain specified harbors, and elsewhere through the collector of customs; and the enforcement of the enemy alien act and the responsibility for seeing that its provisions are carried out, lies with the Attorney General, who acts primarily through the United States marshals and deputy marshals.

3. The Secretary of the Treasury is given control of vessels and their crews in harbors by the proclamation of December 3, 1917, which

Recites: "An act to punish acts of interference with the foreign relations, the neutrality, and the foreign commerce of the United States, to punish espionage and better to enforce the criminal laws of the United States, and for other purposes," approved by the President June 15, 1917, and quotes:

Section 1, which provides that whenever the President by Executive order or proclamation declares a national emergency, the Secretary of the Treasury may make, subject to the approval of the President, rules and regulations governing the anchorage and movement of any vessel, foreign or domestic, in the territorial waters of the United States, inspect her, place guards on her, and, if necessary, in his opinion, to prevent injury to vessels or to harbors or waters of United States, or secure observance of rights and obligations of United States, take full possession and control by and with the consent of the President for such purposes, and remove all on board, including officers and crew.

Recites: Proclamation of April 6, 1917.

Recites: That it is now essential to exercise these powers.

Proclaims: A national emergency accordingly and authorizes the Secretary of the Treasury to make regulations governing the anchorage and movement of any vessel, foreign or domestic, in the territorial waters of the United States and to inspect, place guards on, etc., as above.

The Secretary of the Treasury has asked for the cooperation of the naval districts in carrying out these duties to the extent of the use of certain personnel and of patrol boats, which are to be detailed for boarding and transportation work, after conference between the district commandant and the officer in the particular port representing the Secretary of the Treasury in these matters. In agreeing to this cooperation the Navy Department has pointed out to the Treasury Department, and it is a matter of agreement and understanding between the two departments, that this cooperation must be somewhat limited by force of circumstances, due to the scarcity of the supply of tugs and vessels of the type best adapted to this service, and that at any time some emergency may arise that would make superior demands upon and remove the services of the vessel at the disposal of naval districts.

4. The Attorney General is charged with the duty of enforcing the restrictions placed upon enemy aliens by the proclamations of April 6, 1917, and November 16, 1917. This latter

Recited: Section 4067 Revised Statutes: Whenever war is declared and the President makes proclamation, all natives, citizens, denizens, or subjects of the hostile nation within the United States and not naturalized shall be liable to be apprehended, restrained, secured, and removed as alien enemies. The President is authorized to direct the conduct to be observed by the United States toward them, restraint to which they shall be subjected, provide for removal, and establish any other regulations.

Recites: Sections 4068-4069-4070 Revised Statutes.

Recites: Proclamation of April 6, 1917, which gives rules for guidance of citizens in their intercourse with alien enemies and rules for guidance of alien enemies, and places enforcement as provided in sections 4069-4070, as above.

Proclaims: That an alien shall not be found within 100 yards of canal, of wharf, pier, or dock used directly or by means of lighter for vessel of over 500 tons, etc., or of warehouse at water, railroad, or other terminal, storage or transfer facilities in connection with dock, etc. That Attorney General, in his discretion, may exclude enemy aliens from other depots, warehouses, terminals, etc., not in above described class, etc.

Excludes enemy alien, except on public ferry, from ocean, bay, river, or other waters within three miles of shore line of the United States or its territorial possessions. This includes all inland waters connected with ocean and navigable by ocean-going vessels, including the Great Lakes, all of the District of Columbia, and the Panama Canal Zone. Forbids use of airplanes, balloons, etc. Alien enemies must register as decreed by Attorney General, and must comply with all regulations. Attorney General is authorized in accomplishment of this registration to utilize all agents, agencies, officers, and departments of the United States, and of States, Territories, municipalities, etc., and all such are granted full authority for all acts done in the premises when acting by direction of Attorney General. Alien enemy shall not change his abode or travel except as authorized by Attorney General, etc.

As stated, the duty of enforcing these limitations in respect to alien enemies lies with the Attorney General, and he has, of course, the right to call upon the Federal authorities, including the armed forces of the United States, and State, city, town, or village authorities, to assist.

Regulation 4 of the proclamation of April 6, 1917, has never been strictly and completely enforced, but to the extent and in the manner directed by the Attorney General. A circular was issued by the Attorney General, dated May 22, 1917, giving instructions as to the issue of permits under regulation 4 of the President's proclamation of April 6, 1917. It is understood that this is considered to be no longer active. Another set of instructions to United States attorneys and marshals for the enforcement of the supplemental proclamation of November 16, 1917, was issued by the Attorney General, dated December 17, 1917.

The Attorney General has by letter of November 30, 1917, called this proclamation to the attention of the Secretary of the Navy and asked his views as to the manner and extent of cooperation with a suggestion as to the form it should take, and the Secretary of the Navy has explained the limitations imposed by the necessities of the situation, and agreed to afford the full measure of cooperation possible under existing circumstances in the following letter:

"Answering your letter of November 30, requesting cooperation in establishing and maintaining a system of patrol over areas covered by supplemental proclamation recently promulgated regarding alien enemies, I have the honor to say that the area covered by the President's proclamation includes not only a portion of the entire coast and of all the harbors, but the banks of all navigable rivers and sounds and inland waters navigably connected with the high seas, including the Great Lakes and territorial possessions.

"The Navy Department has undertaken to regulate and otherwise safeguard shipping in portions of these areas, those defined as defensive sea areas in the President's several proclamations in respect to such areas, and to establish systems of defense as to various activities of the enemy which it has been thought could be reasonably anticipated, and which fall within the scope of naval operations to undertake.

"Whenever and to the extent that patrol service established by the Navy in connection with such activities covers any of the areas referred to in the proclamation, cooperation will gladly be furnished as far as practicable.

"The opinion appears to be very generally held that the best and most reliable protection can be afforded by armed guards or secret watchmen on the docks or piers and within the plants. It is understood that steps are being taken—are in fact well advanced—to place at the disposal of the Army an organized force to be used for this purpose.

Within the scope of naval operations, however, to furnish protection to patrol them, except as incidental to such service, and no attempt

can be made to establish any general system of patrol covering all of the areas defined in the proclamation."

* * * * *

5. Following are various rulings, given in brief, and observations on these matters by this department and others when dealing with various concrete cases where action has been required.

The Secretary of the Navy has said:

"Such acts as the destruction of bridges and the obstruction of channels by individuals or small civilian parties, are felonies or offenses against the law, whether occurring in peace or war. The National forces are not permitted of their own volition to assist the local authorities in the police duties which devolve upon these authorities, and in some States are very jealous of interference by the Federal forces in the enforcement of the police power. The law is very specific on this point, and the fact that the country is at war does not alter the rights of the local police in dealing with the civil offenses."

And again, upon a request to guard railway bridges and local piers:

"To guard the countless railway bridges, tunnels, piers, etc., by which the Navy is served, would overtax the strength of the entire Navy. Any naval force which might be assigned to such work would be liable to withdrawal should occasion demand their employment elsewhere. It would appear, therefore, that in the impossibility of furnishing guards from the Navy, each community must supply police protection for the utilities lying within its jurisdiction. Not the least of the advantages of such an arrangement would be the avoidance of these controversies between the civil and the military authorities, which would surely arise if the latter were to attempt to take over some of the duties of the former."

In the case of the Bremerton water works, it was stated that the navy yard at Puget Sound was "entirely and absolutely dependent upon this water system for its supply, and should it be cut off the yard could not run beyond three days." An extreme case, but although the Judge Advocate General allows the authority under such circumstances he qualifies it, as will be noted in the last part of the quotation.

It is certainly clear from the attached papers that the waterworks question, upon which the navy yard, Puget Sound, is "entirely and absolutely dependent" for its sustenance, is therefore to a limited extent an instrumentality of the Federal Government, the duty of protecting which devolves upon such Government in view of the circumstances disclosed by the attached papers. That the President has power to utilize the naval forces where their employment is necessary in order to protect the property and interests of the naval establishment of the United States is undoubted and needs no authorities in support of the proposition; and this would be true even in time of peace. It is accordingly my opinion that the necessary orders to effectually protect the water supply of the navy yard, Puget Sound, may be issued by the Secretary of the Navy acting for the commander in chief. It is needless to say that any action taken under this authority should, if practicable, be with the knowledge and consent of the local authorities where they are unable to cope with the situation. This appears to be the case shown by the attached papers—an implied, if not express, consent for the use of the naval forces—for the purpose mentioned is certainly contained in the letter from the mayor of Bremerton and the governor of Washington.

W. C. WATTS,
Judge Advocate General.

The Navy Department did not approve this request.

Brig. Gen. L. McI. Carter, in charge of Division Militia Affairs of the Army:

"The desire to thrust the protection of private enterprises upon the Army should be checked, else the fighting forces in Europe will be affected. States, individuals, cities, and manufacturers should be impressed with the idea that the relation of the Government to State and individual is not changed by reason of the war in Europe, and States, municipalities, and corporations should then comply with these obligations of protecting life, liberty, and property."

The question of how best to furnish this protection has also been the subject of much thought and discussion, and some comments in this direction are quoted:

By direction of the Secretary of the Navy:

"Probably the best protection against criminal acts against your property is a properly organized secret service, as injuries likely to occur would probably be inflicted by individuals and not by an armed body of the enemy forces. It is the attack by armed forces that should be resisted or watched for by the Navy and not the act of an individual criminally inclined."

From Chief of Naval Operations:

"The guarding of the water supply is a function of the State and local military forces. It is directed that the necessary action be taken to bring the inadequate guard to the attention of the proper authorities."

C. N. C.

"Requests for armed guards at private plants should not be considered by the commandant. Persons or corporations making such requests should be informed that it is the duty of the local authorities to furnish police protection, or of the State authorities to furnish protection by State troops. Where firms are making important material for the Navy Department, the department will forward requests for armed guards to the War Department for such action as may be practicable."

C. N. C.

"The department does not contemplate as a general proposition the establishment of patrols inside of harbors. It is realized, however, that in and near large seaports there are certain private activities which are of great interest to the Government and to allied nations, which can not receive a full measure of protection from forces on shore. It is considered proper for commandants to establish such patrol of rivers and harbors leading to large cities as will insure keeping the channels open and will prevent possible attack from armed boats on shipping at wharves."

C. N. C.

Commandant of the district:

"In addition to the above the commandant should make arrangements to provide for armed guards on all pier ends as patrol boats alone can not furnish the necessary protection, but must have armed guards on shore to protect by means of arms as well as against danger of fire."

From report of chief of staff of naval district as to piers:

"The above is submitted, however, with the opinion that the most constant and careful watch, and the most reliable protection, can be given by armed guards equipped with searchlights on the pier ends and that reliable protection can not be given by patrol boats alone."

5. It should be noted that the authority resting upon the Secretary of the Treasury under the proclamation referred to is the making and enforcing of rules and regulations governing the anchorage and movements of vessels and their inspection, the authority to place guards on board if necessary to prevent injury to the vessels or to the harbors or waters of the United States, and in order to secure observance of rights and obligations of the United States, the authority to take full possession of vessels and to remove all on board, including officers and crew; and it should be noted that the authority of the Attorney General is with respect to alien enemies, and, when requested by the Attorney General in respect to an alien enemy, or by the Secretary of the Treasury, with respect to a merchant vessel or or its passengers or crew, the Naval Reserve Force become authorized to carry out the orders given by these officials or their representatives, and doubtless have all the power that the Attorney General or the Secretary of the Treasury might have under the circumstances. These powers, it should be noted, are to compel search and arrest.

Several inferences can safely be drawn from the foregoing with regard to the policy of the Navy Department as to how far the naval district forces should concern themselves with these activities. The question of cooperation between the Navy and Treasury Departments will be worked out under the direction of the district commandants, as indicated so far as the Navy is concerned; and the question and character of cooperation to be maintained with the Department of Justice will be seen from the letter given above. There is no question, of course, as to property or plants which are upon or form part of an inclosure under the exclusive control of the Navy Department, or of naval vessels. These are to be guarded at all times, and the obligation to do this falls on the naval and naval district forces. As to other wharves piers, vessels, State and municipal property, munitions and merchandise, if in the discharge of the regularly ordered duties of the naval districts patrolling or otherwise, any attempt to injure such property should be observed or suspected, on the part of an alien enemy or any other person, the force observing it should undoubtedly attempt to prevent such injury and to apprehend such offender and to turn him over, if an alien enemy, to the nearest United States marshal or his representative; if any other person, to either the State or the Federal or municipal authorities, whichever is not most advisable or convenient under the circumstances; that is, of course, if immediate action is required, otherwise the occurrence should be immediately reported to someone authorized to deal with it. Beyond this, no patrolling or guarding should be attempted. It is to be observed that the responsibility for guarding against such attempts, and of ascertaining suspects, does not rest with the district forces, but only when such incidents are encountered in the course of their regular work, and when in an emergency their aid is definitely sought by Federal State, or municipal authority. A case in point would be a district vessel undergoing repairs at a private plant. In this case the crew should guard the vessel, and keep continuous sentry on guard to prohibit any unnecessary entry on the vessel, and the crew should, while in the yard, aid in apprehending any person suspected

intended injury to the plant, or other vessels there. But the guarding of private plants from attack, either by an alien enemy or by some other evilly disposed individual, can best be done on shore; is not primarily the duty of the naval districts' forces, and these forces are not the first or even the second, in point of precedence which would be invoked by the Attorney General.

7. It is understood that many, if not most, of the private shipyards and plants, which are doing work for the Government under contract or agreement, have obligated themselves as part of their contract to maintain sufficient guard to protect the work from this very type of injury. This obligation should be insisted upon and made the subject of constant inquiry, and those in charge should be instructed how best to carry it out. The municipal authorities and the State authorities controlling the territory in which such plants are situated, are also bound to protect the property from any person attempting such acts, and such persons are in any event, common criminals, which it is the duty of the State and municipal authorities to apprehend and control. The Army has been authorized also to create a special force for this purpose and, in addition to this force, there is available to a greater or less extent, according to the locality, the State militia and various other organizations of home guards, etc.

8. If called upon directly to institute a water patrol in front of some particular plant by some one of the authorities above enumerated, even if unusual conditions seem to justify the service, care should be taken to see that the plant in question is adequately guarded on the shore side, and that the piers, if any, are patrolled by means of guards on the piers themselves, otherwise the patrol of the water front would not be sufficiently effective to justify the diversion of the district forces to that purpose. It is also hardly worth the diversion of the force to attempt to guard one point where other points in the same locality, equally worthy of protection, are not receiving it.

9. It seems to be generally agreed, and the reasons are obvious, that an armed guard on a pier with a searchlight is a much better protection than a patrol on the water; and such protection can, of course, be furnished without interfering with the patrol organization and duties.

10. It is considered that if good judgment is used in dealing with applications to the district forces for such protection, besides making the attitude of this department clear, and also the reasons and justification for it, the duties of the State and local authorities, and of the owners of the plants, can be pointed out and insisted upon.

JOSEPHUS DANIELS.

Extracts from "An act making appropriations to supply urgent deficiencies in appropriations for the Military and Naval Establishments, etc.," approved June 15, 1917:

To purchase, requisition, or take over the title to, or the possession of, for use or operation by the United States any ship now constructed or in the process of construction or hereafter constructed, or any part thereof, or charter of such ship.

Compliance with all orders issued hereunder shall be obligatory on any person to whom such order is given, and such order shall take precedence over all other orders.

* * * If any person owning any ship * * * shall refuse or fail to comply therewith or to give to the United States such preference in the execution of such order, or shall refuse to * * * supply * * * the ships * * * so ordered, at such reasonable price as shall be determined by the President, the President may take immediate possession of any ship, * * * and may use the same at such times and in such manner as he may consider necessary or expedient.

Whenever the United States shall cancel, modify, suspend, or requisition * * * any ship * * * in accordance with the provisions hereof, it shall make just compensation therefor, to be determined by the President; and if the amount thereof, so determined by the President, is unsatisfactory to the person entitled to receive the same, such person shall be paid seventy-five per centum of the amount so determined by the President and shall be entitled to sue the United States to recover such further sum as, added to said seventy-five per centum, will make up such amount as will be just compensation therefor, in the manner provided for by section twenty-four, paragraph twenty, and section one hundred and forty-five of the Judicial Code.

The President may exercise the power and authority hereby vested in him, and expend the money herein and hereafter appropriated through such agency or agencies as he shall determine from time to time: * * * All ships constructed, purchased, or requisitioned under authority herein, or heretofore or hereafter acquired by the United States, shall be managed, operated, and disposed of as the President may direct.

The word "person" as used herein shall include any individual, trustee, firm, association, company, corporation, or contractor.

The word "ship" shall include any boat, vessel, or submarine and the parts thereof.

Vessels taken over and purchased by naval districts Dec. 13, 1918.

[Agreement A, Government owned. Agreement B, free lease, \$1 per month plus cost of restoration and restoration only. Agreement C, chartered.]

Capt. PRATT. We now come to a series of plans in the regulating of estimates that were made—you must remember we had very little time to work and commit ourselves much to writing. The

real thing which was desired was the decision, and opportunity for the secretary and the chief of naval operations to look at decisions and not be involved in a mass of reasoning about the decisions, so that they could make quick decisions. I wrote these myself, but I am sorry to say that, being very careless, I have not placed dates on them.

I wish especially to invite your attention to that. I do know, however, that they took place between the time I went to the office in the first part of February, and when I became aid for operations in June, and I know very well, too, when most of them took place previous to the war or when we came in. Some of them were before and some of them after.

The CHAIRMAN. In each case will you give the estimate of the date as near as you can get at it?

Capt. PRATT. I will try to do it as near as I can. This plan is as follows [reading]:

PLAN—MISSION TO RENDER THE MAXIMUM POSSIBLE SUPPORT NOW TO THE ENEMIES OF THE CENTRAL POWERS.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington.

War being declared, the third general mission becomes the "immediate mission."

Third. Immediate mission: To render the maximum possible support now to the enemies of the Central Powers.

Reconciling the various decisions arrived at from the different estimates of the situation (general), the following "decisions" to the immediate mission are arrived at. These decisions serve as the "missions" to further estimates and more detailed "plans" for each decision of the "immediate mission."

Decisions to (third) immediate mission: Action taken.

1. Mobilize all naval districts.
2. Mobilize all naval vessels.
3. Organize for antisubmarine warfare.

a. Organize, inaugurate policy and make plans for the operation and administration of the naval districts.

b. Adopt the policy that our present mobile naval force shall be so distributed and used that they further the immediate mission and do not handicap it.

c. Make estimate of the best methods for cooperating the present naval and military forces to meet the immediate needs caused by the antisubmarine war.

d. Adopt the policy that our merchant shipping shall be protected against antisubmarine warfare to the utmost, and its aims directed toward furthering the immediate needs of our cooperating allies, and our own future needs.

e. Inaugurate a naval building policy which will best meet our immediate needs.

f. Inaugurate a financial policy with regard to the moneys already appropriated by Congress, and not yet specifically allotted, together with estimates of further moneys that may be needed.

g. Make a survey of our general diplomatic situation, with special reference to naval and immediate needs.

h. Make a survey of general financial and industrial situation with view to organizing same to meet immediate needs.

i. Outline the general scheme whereby we may best cooperate with our allies.

j. Make a general military survey and estimate of the immediate situation.

k. Formulate a policy whereby the proper necessary news may reach the public, in order that its interest may be kept up, and morale stimulated, without disclosing important military secrets.

l. Direct the policy of our naval bases as to reserve, repair, operating, and supply facilities to meet the following conditions (1) the needs of the immediate situation, 2) our future needs.

m. Thoroughly organize the naval general staff for the purposes of advising, planning, communicating, supplying, repairing, and operating all naval facilities to meet 1) the immediate situation, (2) the future needs.

(n) Take steps to overcome the present shortage in personnel of the Navy, in officers and enlisted men, and prepare plans to establish a reserve to fill casualties which might be caused (1) by the immediate situation, (2) by the most probable future situations.

(o) Inaugurate a system of training for our naval forces, active and reserve, to meet (1) the immediate situation, (2) the most probable future situation.

(p) Establish a policy with reference to the use of mines in the present emergency.

(q) Establish the policy to be adopted toward the German vessels now lying in our ports:

(a) As regards the vessels having a national character.

(b) As regards the interned merchant vessels.

The CHAIRMAN. Is that an operational plan?

Capt. PRATT. No; it is operational to a certain extent, but it is more basic than anything else.

The CHAIRMAN. That was drawn by you in the Bureau of Operations?

Capt. PRATT. Yes, sir; I wrote it myself. Here is another plan. [Reading:]

Plan. Mission: Make a general estimate of the character of service which will be required of our naval forces in order to serve best our own interests and to cooperate with our allies.

This, you must realize, was before we went into the war, but while the patrol system was so in vogue with Great Britain, and to establish a patrol, I wish to state now, is one of the best ways to get our various craft coming from all sources; the yachts we would take in from outside sources, and all the rest, thoroughly organized in the quickest way before they were sent abroad; so that just as soon as the idea germinated that we were to drop the patrol and send forces abroad we had forces already organized and trained, ready to go abroad and do the work, which would not have been the case had we not had an organization of this sort established to conduct this particular section of work; and the coast patrol which was adopted on our coast was not a handicap to the vessels that went abroad. On the contrary, it served as very useful training for the vessels and the men, particularly those of the reserves who came in later, and it allowed them to know something of the work that they would be called upon to conduct abroad.

This plan is as follows. [Reading:]

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington, D. C.

Mission.—Make a general estimate of the character of service which will be required of our naval forces in order to serve best our own interests and to cooperate with our allies.

Following an estimate of the situation, the below conclusions were reached:

CONCLUSIONS.

1. That there will be required of the Navy the following service tasks: (a) The service of security or defense, (b) the service of information, (c) an active offensive against the enemy, (d) a reserve of force ready to assume the offensive when the opportunity arrives, and (e) the service of logistics.

2. To meet the above service tasks the following forces are assigned or created (a) District coast defense, (1) to protect the coast against all enemy efforts, (2) to protect logistics within the area of its jurisdiction, and (3) conducted by the water craft and land forces assigned for this purpose; (b) patrol and escort, (1) to assist logistics beyond the limits of the coast defense districts; (2) to patrol for information, (3) to operate actively against S. M. and their bases, and (4) conducted by yachts, destroyers,

cruisers, small Government vessels; (c) information forces, (1) to assist all services—offensive, reserve, logistics, defensive, and (2) conducted by communication service, (3) N. I. service, appropriate patrol and escort force, district scouting force, and appropriate district coast defense force; (d) active offensive, (1) to operate against the enemy S. M. and bases and raiders, (2) conducted against S. M. and bases by appropriate district forces, patrol force, submarines, destroyers, and (3) conducted against raiders by cruisers; (e) reserve, (1) to train to be and to hold themselves in readiness to act offensively against the enemy; (2) conducted by battleships, major ships not in active use, any fleet auxiliaries needed to further fleet training, that portion of the train needed in the service of fleet logistics; (3) to be effected at such places as—(a) the fleet may be on the strategic offensive, and (b) the fleet may be mobile; (f) logistics, (1) to carry supplies to the Allies, (2) conducted by armed merchant ships, unarmed merchant ships, and national vessels; (3) to carry supplies to national forces, and (4) conducted by the train.

Here is another plan [reading extracts]:

Mission.—Adopt the policy that our present mobile naval forces shall be so distributed and used that they further the immediate mission and do not handicap it.

Decision...... (3)..... B..... immediate mission.

Adopt the policy that our present mobile naval forces shall be so distributed and used that they further the immediate mission and do not handicap it.

(3)..... B..... immediate mission.

Adopt the policy that our present mobile naval forces shall be so distributed and used that they further the immediate mission and do not handicap it.

Estimates of the general situation bearing on the above mission were submitted by the General Board, Commander Schofield, Capt. Magruder, Commander Sterling, Capt. Pratt, Capt. Plunkett. Estimates of local problems involving the Atlantic coast, the Caribbean area, the New York area were submitted by Commander Lanning and some of the above-mentioned officers. Reconciling the various estimates, the following decisions were reached.

I will tell you here was a case where the decision was countermanded by Admiral Benson directly.

The CHAIRMAN. I do not think you have given the date of that.

Capt. PRATT. I have not the date, but it was prior to the war.

The CHAIRMAN. Can you give the probable date?

Capt. PRATT. It was in February or March. It was a very serious oversight on my part not to date these plans, but not being a stenographer and typewriter I made that omission.

The CHAIRMAN. In each case I wish you would say whether it was prior to the war or not.

Capt. PRATT. This was prior to the war. [Reading:]

DECISIONS.

1. Send battleships and armored cruisers to Pacific in order to—
 - (a) Remove those types that can have no immediate military purpose as far from the submarine menace as possible.
 - (b) Place them where their potential as a fleet in being might be used to the best political advantage.
 - (c) Relieve vessels in the Pacific needed in the Atlantic to cope with the immediate situation.
 - (d) Allow battleships a free drill ground for bringing and keeping ships up to maximum efficiency.
 - (e) Remove the bad morale effect of practically interning our own battleships in the Atlantic seaports.
 - (f) Avoid the congestion at our navy yards consequent to preparing our coast defense districts, our gunboats and small cruisers, our patrol fleet, and destroyers for an active campaign in the Atlantic.
 - (g) Free certain auxiliary types, especially the destroyers and mining vessels, from their duty of guarding the fleet, and thus permitting them to operate actively against the enemy.

2. Send the fleet train, or such portions of it as are necessary to subsist the battleships, to the Pacific.
3. Send the fleet submarines with the battleships to the Pacific.
4. Make the necessary arrangements for the navy yards on the west coast to undertake all the repairs to the battleships and armored cruisers it is possible for them to handle.
5. Retain all the other submarines in their present separate organization, and not under the coast defense districts.
6. Assign to the naval craft in the fitting out and repair work at the yards, necessary to put these craft in a position to cope with the immediate submarine warfare, the following order of precedence of work:
 - (a) Destroyers.
 - (b) Small craft, gunboats, cruisers.
 - (c) Submarines.
 - (d) Battleships.
 - (e) Fleet auxiliaries.
7. Send the fleet mining force to the coast defense districts to form the nucleus of the sweeping forces operating from there.
8. Distribute the Atlantic coast defense battleship division, to act as training ships for the naval personnel, mobilized in that district.
9. Organize the destroyer and remaining naval mobile forces into a patrol force to cooperate with the naval district forces in combatting the present submarine warfare.
10. Draw up a general plan of operations for this patrol force.
11. Issue to the patrol force the manual on submarine warfare prepared for the naval districts.
12. When the reserve battleship forces are put in condition in accordance with (d) or paragraph (6) to have them join the main fleet.
13. Keep the main forces of the marines where they are at present needed, but be prepared to supply the ships of the patrol force operating in the Gulf and Caribbean waters with marine guards.

The idea of not having that fleet sent to the Pacific was not because in a theoretical sense it was sound, but because there might be a lowering of the morale, and therefore, even though it might cause a certain amount of congestion at the navy yards, it was deemed wisest to have the fleet come north, and the decision was made by Admiral Benson, and it was undoubtedly a sound decision; to have done that would have relieved some of the congestion of the navy yard work on this side.

The next plan, which I have marked 7, was also before the war. It is as follows:

PLANS FOR—

Decision (9).—Organize the destroyer and remaining naval mobile forces into a patrol force to cooperate with the naval district forces in combating the present submarine warfare.

Decision (10).—Draw up a general plan of operations for this patrol force.

Missions.—No. (9). Organize the destroyer and remaining naval mobile forces into a patrol force to cooperate with the naval district forces in combating the present submarine warfare. No. (10). Draw up a general plan of operations for this patrol force.

From an estimate of the situation on No. (9), prepared by Commander Schofield, the following decisions are made:

DECISIONS TO (9). (ACTION TAKEN.)

(1) To base the organization of the patrol force upon the character of the work it may be called upon to do and upon an estimate of the probable localities of its operations.

(2) To keep in mind the apparent necessity for some sort of patrol and of escort for the merchant shipping entering and leaving our principal ports, a protection which will extend beyond the limits of efficient operation of the district forces.

(3) To base the assignment of ships to the organization upon the two most probable forms of duty a patrol force would be called upon to do: (a) Off shore or sea patrol, requiring a high degree of endurance, with normal low speeds; (b) escort duty, requiring a high degree of speed and mobility, but a lesser degree of sea endurance; and (c) a certain degree of immunity from submarine attack for each class.

4) That the principal areas of operation for the patrol force will be: (a) The Boston sea area; (b) the New York sea area; (c) the Delaware capes sea area; (d) the Chesapeake capes sea area; (e) the Key West sea area; and (f) the Canal Zone sea area.

5) That the sea areas of minor importance are: (a) The Narragansett Bay sea area; (b) the Savannah and Charleston sea areas; (c) the New Orleans, Mobile, Pensacola, and Galveston sea areas; (d) the Mexican Gulf coast; (e) the Central American coast; (f) the Caribbean fringe of islands, and (g) the South American coast line to the Caribbean fringe.

6) On the basis of the above requirements to organize the patrol force into six squadrons of three divisions each, with six vessels to a division. Total 111 craft when fully recruited.

7) To assign to each squadron vessels of each type: (a) The low speed, high-endurance class; (b) the high speed, low-endurance class.

8) To keep similar units together in divisions to facilitate their working in harmony and to interrupt to as slight a degree as possible the present fleet organizations, from which some of the units forming the patrol force are drawn.

9) To assign competent leaders to each squadron.

10) To assign a patrol force commander for the entire force.

11) To enter the organization of the patrol force on the mobilization sheet.

From estimates of the situation based on the solution of the New York problem and the Caribbean area problem, the following decisions to (10) are arrived at:

DECISIONS TO (10). (ACTION TAKEN.)

(1) That the first best assignments of the patrol force would be as follows: (a) One squadron to the Boston sea area; (b) two squadrons to the New York sea area; (c) one squadron to Delaware Capes sea area; (d) one squadron to Chesapeake Capes sea area; (e) one squadron to Key West sea area.

(2) That the best normal position for the commander of the patrol force would be the New York sea area.

(3) That the normal line for the inshore patrol under the supervision of the coast defense districts, will extend to the 50-fathom curve.

(4) That where the water deepens to more than 50 fathoms after leaving the harbor entrances, the district patrols need not accompany, escort or patrol to a distance in excess of 45 miles, unless the waters to seaward of this limit are flanked by the mainland or are covered by a fringe of outlying islands.

(5) That the activities of the patrol forces begin where the jurisdiction of the coast defense districts cease.

(6) That the outer limits of escort and patrol, for the patrol force, will not at first extend beyond the longitude of the shoals on Georges Bank.

(7) That in the Caribbean problem, as it affects the Canal Zone, the outer limit of the most probable submarine efforts will not extend to the eastward of a line between Roncador Reef and Cartagena Harbor until the outer fringe of the Caribbean Islands is reached, when a second probable submarine area is liable to be encountered.

(8) That in the protection of shipping coming from and entering the Gulf of Mexico, a probable area of submarine operations lies in the Yucatan Channel, the Straits of Florida, and the waters between the Bahama Islands, the mainland, and Cuba.

(9) That the most probable basing spots for submarines are on the Cuban coast, the islands and reefs of the Caribbean and Gulf, the Central and South American coasts, and in the summer season the coasts of Maine and Nova Scotia.

(10) That the most probable areas of enemy submarine activities will always lie as close to the entrances and exits of the ports of shipping as the district patrol and sweeping operations render practicable.

(11) That the intensity of the submarine activities off any port will depend upon its maritime importance.

(12) That if its operations are discovered and its activities handicapped in any one area the submarine will transfer its activities to the nearest most likely area.

(13) That the probable number of enemy submarines now operating lies between 150 and 300, of which 200 is a fair probable estimate.

(14) That of this number probably not more than 75 will keep the sea at one time. That, of the 75 at sea, probably not more than 35 will ever be on this coast (including the Caribbean) at one time.

(15) For the purposes of training, and to familiarize officers with the probable situations that might arise, to submit problems to the commander of the patrol force and to his staff for solution.

The next plan, which I have marked 8, is a plan for organization of a patrol force. Admiral Wilson, before the war, organized the

patrol force and put it into effect. (That is the organization showing the ships.) It flowed automatically from the preceding estimates we had made, and this put it into effect. I submit that plan.

The CHAIRMAN. What was the date of that?

Capt. PRATT. He joined sometime toward the end of March, and the plan was started sometime before he joined. It was before we entered the war. I do not know the date, but I know it was before the war and at the time he came up to take command.

(That plan is as follows:)

MEMORANDUM FOR CAPT. PRATT.

[Organization of patrol force, April 1, 1917: *Olympia*, flagship; *Panther*, destroyer tender; *Dixie*, destroyer tender.]

SQUADRON 1.

Division 1:

Chester, flagship.

Des Moines (special duty, Mediterranean).

Division 2:

Smith.

Flusser.

Lamson.

Preston.

Reid.

SQUADRON 2.

Division 4:

Birmingham, flagship.

Sacramento (under repairs).

Division 5:

Walke.

Monaghan.

Perkins.

Roe.

Sterett.

Terry.

SQUADRON 3.

Division 7:

Dolphin (Virgin Islands, temporary).
Chattanooga.

Division 8:

Warrington.

Henley.

Beale.

Patterson.

Mayrant (out of commission).

SQUADRON 4.

Division 10:

Tacoma, flagship; Mexican patrol.

Denver.

Division 11:

Cummings.

Ammen.

Jarvis.

Burrows.

McCall.

Fanning.

SQUADRON 5.

Division 13:

Cleveland, flagship.

Raleigh (under repairs, Mare Island).

Division 14:

Cassin.

Jouett.

Trippe.

Jenkins.

Drayton.

Paulding.

SQUADRON 6.

Division 16:

Albany.

New Orleans (under repairs, Puget Sound).

Division 17:

Balch.

Benham.

Aylwin.

Parker.

Downes.

Duncan.

MARCH 28, 1917.

To: Capt. Henry B. Wilson, United States Navy, commanding U. S. S. *Pennsylvania* (commander in chief, Atlantic Fleet).

Subject: Detached command of *Pennsylvania*; to command Patrol Force, Atlantic Fleet.

1. Upon the arrival of the *Pennsylvania* in American waters you will regard yourself detached from duty in command of that vessel; will proceed to Washington, D. C. and report Navy Department for temporary duty.

2. When so directed you will regard yourself relieved of this temporary duty, will proceed to such port in which the *Olympia* may be and assume command of the Patrol Force, Atlantic Fleet, *Olympia* flagship.

JOSEPHUS DANIELS.

PATROL FORCE UNITED STATES FLEET,
U. S. S. "OLYMPIA," FLAGSHIP,
Fleet Base Three, April 9, 1917.

Campaign Order No. 1:

Forces:

- (a) Northern Detachment, Capt. Jones, Squadron 1.
- b) Nantucket Detachment, Capt. Twining, Squadrons 2, 3.
- c) Delaware Detachment, Capt. Oman, Squadron 5.
- d) Chesapeake Detachment, Capt. Morgan, Squadron 6.
- e) Gulf Detachment, Capt. Johnson, Squadron 4.

1. No news regarding enemy forces.
2. This force will give maximum possible protection to trans-Atlantic commerce of the United States and to friendly powers in areas to seaward of and contiguous to areas guarded by naval district forces. Vessels shall on every occasion use all means within their power to capture or destroy every enemy submarine sighted.
3. (a) Northern Detachment: Guard area between lines bearing 135 through Cape Sable and Nantucket Shoal Lightship and Barnegat. Base, Boston and Portsmouth.
- b) Nantucket Detachment: Guard area between lines bearing 135 from Nantucket Shoal Lightship and Barnegat. Base, New York and Newport.
- c) Delaware Detachment: Guard area between lines bearing 135 from Barnegat and Assateague Light. Base, Hampton Roads.
- d) Chesapeake Detachment: Guard area between lines bearing 135 from Assateague Light. Base, Hampton Roads.
- e) Gulf Detachment: Guard area Florida Straits and Gulf of Mexico. Base, Key West and New Orleans.
- f) Proceed when ordered. Use 75 time.
4. Tenders: *Dixie*, base Key West; *Panther*, base Newport.
5. Cipher ROT.
- Flag in *Olympia* bases vicinity of New York.

H. B. WILSON.

Subject: Instructions to vessels of patrol force.

1. Patrol commanders will patrol to the best advantage the areas assigned, with the view to safeguarding trans-Atlantic shipping and destroying enemy submarines sighted.
2. Make every effort to facilitate the passage of vessels through the patrolled area.
3. From sunset to sunrise ships to be darkened and lookouts stationed both aloft and on deck.
4. At all time of the day and night such portion of the battery to be manned and ready for use as is necessary to open fire instantly on a submarine sighted on any bearing.
5. The gun is the primary weapon against the submarine. but this is not to preclude the use of torpedoes when conditions warrant.
6. Visual signals will not be used at night except in cases of emergency, and then to be restricted to the use of blinker tube if possible.
7. Searchlights will not be used for search, but to illuminate a target already definitely located, and they should be turned off immediately when the target has disappeared.
8. Recognition signals as directed.
9. Radio: Every precaution shall be taken to ensure that unnecessary radio messages are not sent, and messages when sent should be as brief as possible. Use land lines and cable for communication rather than radio.
10. In case of reported contact with an enemy vessel, the two adjacent vessels will proceed to assist in hunting down the enemy, keeping lookout for possible mate.
11. The patrol force will cooperate with the commandants of the naval districts in every way.
12. Upon discovering a submarine by night a patrol boat may be able to get very close before being seen. An attempt to approach as close as possible shall be made before turning on a searchlight or firing guns. The submarine shall be stalked at night and surprised; wait until the patrol boat is nearly on top of the submarine before announcing the boat's presence by searchlight and gun. Care must be exercised that the object seen is certainly a submarine before making radio report, for this may tell the submarine that patrol boats are in its vicinity.
13. Consider any submarine hostile unless it is definitely known that our submarines are operating in the locality.
14. When a raider is reported the available vessels of the supports will be sent to sweep to the best advantage in the area under the supervision of the patrol force. If

the raider is reported within a patrol area, the commander of the patrol will assist in the search within his own area, having due regard to his patrolling duties.

15. Vessels will continue the search until otherwise directed. When the officer conducting the search considers that further operations are not justified, he will request instructions for the force commander.

PATROL FORCE UNITED STATE FLEET,
U. S. S. *Olympia*, Flagship, April 17, 1917

Campaign order No. 2.

Forces:

- (a) Northern patrol, Capt. Jones, squadron 1.
- (b) Nantucket patrol, Capt. Twining, squadron 2.
- (c) Chesapeake patrol, Capt. Morgan, squadron 6.
- (d) Southern patrol, Capt. Oman, squadron 5.
- (e) Gulf patrol, Capt. Johnston, squadron 4.
- (f) Caribbean patrol, Capt. Anderson, squadron 3.
- (g) Supports, *Olympia*, *Columbia*, *Charleston*.

1. The area assigned to this force has been extended to include a portion of the Caribbean heretofore supervised by the French.

2. This force will furnish maximum possible protection to trans-Atlantic commerce of the United States and friendly powers in areas to seaward of and contiguous to areas guarded by naval district forces.

3. (a) Northern patrol: Guard area between lines bearing 90 from Cape Sable and 100 from Sankaty Head. Base, Boston and Portsmouth.

(b) Nantucket patrol: Guard area south of northern patrol to line bearing 110 from Absecon light. Base, New York and Newport.

(c) Chesapeake patrol: Guard area south of Nantucket patrol to line bearing 100 from Cape Canaveral. Base, Charleston.

(d) Southern patrol: Guard area south of Chesapeake patrol to line bearing 107 from Cape Canaveral. Base, Charleston.

(e) Gulf patrol: Guard area of the Bahamas south of Southern patrol north of latitude 23 and west of meridian 75, and the Gulf of Mexico. Base, Key West and New Orleans.

(f) Caribbean patrol: Guard area south of Gulf and Southern patrols, and the Caribbean west and north of a line from the Panama-Colombian boundary to the west point of Jamaica, thence along north coast of Jamaica, south coast of Haiti, Porto Rico, and Santa Cruz, through Anegada passage, and thence 84°. Base, Guantanamo, Canal Zone and St. Thomas.

(g) Supports: *Columbia* at Hampton Roads; *Charleston* at St. Thomas. Be prepared to operate at high speed on short notice as far as meridian 50. Keep full of fuel.

(h) Use every means to capture or destroy enemy submarines sighted.

Cooperate closely and constantly with the commandants of naval districts in adjustment of areas of operation, in exchange of information, and in routing outgoing and incoming merchant vessels. Tenders are available for repairs within their capacity. Effective noon, April 25. Proceed then. Use 75 time.

4. Tenders: *Dirie* at Key West; *Panther* at Newport.

5. Flag on *Olympia* vicinity New York.

Cipher as indicated.

H. B. WILSON.

Then here is a plan for making an estimate of the number and types of small craft necessary to obtain now, in addition to the naval craft already assigned, in order to put the coast-defense districts in a position to cope with the immediate situation, antisubmarine war. That plan is as follows:

PLAN FOR DECISION TO MAKE AN ESTIMATE OF THE NUMBERS AND TYPES OF SMALL CRAFT NECESSARY TO OBTAIN NOW, IN ADDITION TO THE NAVAL CRAFT ALREADY ASSIGNED, IN ORDER TO PUT THE COAST DEFENSE DISTRICTS IN A POSITION TO COPE WITH THE IMMEDIATE SITUATION, ANTISUBMARINE WAR.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington, D. C.

Action taken:

Mission.—To make an estimate of the numbers and types of small craft necessary to obtain now, in addition to the naval craft already assigned, in order to put the

ant-defense districts in a position to cope with the immediate situation, antisubmarine war.

Following an estimate for the coast defense districts, from Eastport, Me., to Galveston, Tex., which involves not only (1) the establishing and protecting of lanes of traffic from our principal shipping ports to the European Continent, but (2) takes into consideration some degree of protection for those ports not of the first importance, but all within the range of submarine activities, the following decisions to meet the immediate situation are made:

DECISIONS.

1. The most important duty is to protect the interests and shipping at the ports of Boston, New York, Philadelphia, and capes of the Chesapeake.
2. That a second but less important step is to protect the interests and shipping at the ports of, or sea areas in the vicinity of, Portland, Me., Narragansett Bay, Charleston, Savannah, Pensacola, Mobile, New Orleans, Port Arthur, and Galveston.
3. That certain harbor police (patrol) will be required for the four principal ports of shipping.
4. That some minor harbor police (patrol) will be required for the lesser important ports.
5. That in addition to the above port protection, and protection to the lanes of maritime travel (indicated as necessary for the four principal ports in decision (1) there will be required certain submarine base hunting operations, coming within the scope of activities of the Coast Defense districts, in the following areas: The coast of Maine; the Gulf of Mexico.
6. That to fulfill the duties outlined in the previous five paragraphs, there will be required in addition to the naval craft already available for use in the Coast Defense districts the following craft for the below-mentioned duties:
 - (a) Harbor entrance patrols (yachts, tugs preferable, or equivalent small craft, of good sea qualities, 50; (b) escort and patrol craft (for the four principal ports of shipping, fast sea keeping motor craft), 250; (c) sweepers and mine craft (for the four ports mentioned above, and for the east entrance of Long Island Sound—sea-going tugs only), 50; (d) harbor police patrol (for the four principal shipping ports, fast small motor craft), 60; (e) submarine base hunting craft (for the Gulf of Maine, 5 coast sections, 12 boats to a section, fast sea keeping motor craft or equivalent), 60; (f) submarine base hunting craft (for the Gulf of Mexico, from the west coast of Florida to Galveston, Tex., fast sea-keeping motor craft, or equivalent), 60; total, 630.

The plan which I have marked "10" was also some time before the war. It is as follows:

PLAN No. 10.

MISSION—TO OUTLINE THE GENERAL SCHEME WHEREBY WE MAY FURNISH ASSISTANCE TO THE ALLIES IN THE SHAPE OF SMALL CRAFT WITHOUT INTERFERING TOO GREATLY WITH OUR OWN SIMILAR NEEDS AND WITHOUT DISRUPTING OUR OWN ORGANIZATIONS.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington.

CONCLUSIONS.

- (1) A law to commandeer shipping should be enacted.
- (2) Vessels are divided into the following general classes:
 - (a) Purely naval.
 - (b) Pleasure craft.
 - (c) Merchant shipping necessary to the overseas traffic.
 - (d) Commercial craft, more or less vital to home needs.
- (3) The craft from which we may choose vessels to send to the Allies, outside of class (a), (purely naval), for patrol purposes, in conformity with the above mission, must come out of classes (b) and (d).
- (4) All of class (b) not absolutely needed at home can be spared.
- (5) Only so many of class (d), which includes tugs and trawlers, as can be spared, should be sent.
- (6) Class (b) includes craft fit for deep-sea work and having good radius of action. It also includes those fit only for near-shore work, with short radius of action.
- (7) To meet the present need:
 - (a) Do not break up existing naval organizations.
 - (b) Inspect all pleasure and merchant vessels and classify.

(7) To meet the present need—Continued.

- (c) Commandeer all pleasure craft (class (b)), that will be needed to fill up the needs of naval districts, patrol force, and distant service.
- (d) Take into naval districts all the pleasure craft (class (b)) that are not sea keeping, and have not a radius of 1,500 miles, that the districts may need; also take into the district forces as many of the tugs and trawlers (class (d)) as trade and fishing can spare.
- (e) Draft into the patrol force all of class (b) having over 1,500 miles radius of endurance, and good sea keeping qualities.
- (f) When necessary to send a patrol force abroad, take from the patrol force on this side, and augment it, with the maximum number of tugs (class (d)) the naval districts can spare.
- (g) If practicable, do not attempt to form new forces, but first increase the present organizations. Utilize their efforts for perfecting the unit organizations now in existence. When needed, detail one or more complete units for special service abroad.
- (h) Speed up the drafting into service of the small craft needed.
- (i) Build tugs and trawlers.

Plan No. 11 was also before the war. Admiral McKean would know more about just when that would come than I would. That plan is as follows:

PLAN No. 11.

MISSION—DIRECT THE POLICY OF OUR NAVAL BASES AS TO THEIR REPAIR, RESERVE OPERATING, AND SUPPLY FACILITIES TO MEET THE FOLLOWING CONDITIONS (1) THE NEEDS OF THE IMMEDIATE SITUATION; (2) THE FUTURE NEEDS.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington.

Following general estimates of the situation, made by Capt. McKean, the Commission on Yards and Bases, and other officers, the following tentative decisions are reached:

DECISIONS—IMMEDIATE NEEDS.

- (1) That the repair facilities of all our yards on the Atlantic coast will require expansion.
- (2) To meet present needs, repair and supply, as navy-yard assets, are much more important factors than building.
- (3) That in the conduct of any war the repair facilities of our navy yards will be so taxed as to leave little room for construction.
- (4) That if the fleet is to be sent north and is to stay there, the repair facilities of the New York strategic area and of the Chesapeake Bay strategic area will have to be enlarged to meet the extra demands that will be made on them.
- (5) That the navy yards should be used first for legitimate naval needs, assigned in the order of present importance.
- (6) To meet the needs of the naval districts, recourse should be had to civil repair facilities (as far as practicable) whenever the mobile repair facilities assigned to a district are not adequate.
- (7) That if the major ships on the Atlantic coast which serve no particularly useful war purpose at present were removed to the Pacific, it would greatly facilitate the ability of the Atlantic yards to cope with the repair needs of ships that were useful in waging submarine warfare.
- (8) That if the major ships are transferred to the Pacific immediate steps will have to be taken to put the Puget Sound area and the San Francisco area in a position to adequately care for them.
- (9) That to meet the immediate situation, in addition to enlarging the repair facilities of the present yards, there will be required new bases, or a great expansion of the facilities of the old bases, as follows, in the order of their importance:
 - (a) New York—Long Island Sound area—Main reserve, repair, supply base—An enlargement or extension of present facilities, within area—First-class base.
 - (b) Chesapeake Bay area—Main reserve, repair, and supply base—An enlargement, or extension of present facilities within area—First-class base.

That to meet the immediate situation, etc.—Continued.

c. Key West area—Operation base, with limited repair and supply facilities, for fleet and submarine operations—Second-class base.

d. Aviation bases (at selected spots).

In addition to present facilities, and those mentioned above under Immediate Needs, there will be required at the place mentioned, bases of the character specified:

e. New London—Main submarine base—First-class base.

f. Charleston, S. C.—Main submarine base—First-class base.

g. Culebra, St.—Advance fleet and submarine operating Thomas area. Base—Second-class base.

h. Canal Zone—Main fleet and submarine operating base—First-class base.

i. San Francisco—Main fleet base—First-class base.

j. San Diego, San Pedro area—Main submarine base—First-class base.

k. Guam—Advance fleet and submarine operating base—Second-class base.

l. Aviation bases (at selected spots).

m. Coast-type submarine bases—(For a limited local defense at certain strategic and advanced positions, beyond quick supporting distance of our coast and forces).

Senator PITTMAN. Captain, this was all prior to the war?

Capt. PRATT. Yes; all prior to the war.

The CHAIRMAN. And so were all the other plans that you have submitted?

Capt. PRATT. Yes; they followed logically up. I wrote these myself, and I am quite sure that I am correct.

Next is this plan which I have marked 12:

PLAN No. 12.

REASON—TO PLAN FOR THE EXPENDITURE OF THE NAVAL EMERGENCY FUND SO AS BEST TO SUPPLEMENT CURRENT APPROPRIATIONS FOR A PERIOD OF SIX MONTHS.

| | |
|--------------------------------------------------------------------------------------------------------------------------|--------------|
| Purchase patrol vessels and yachts for inshore and offshore patrol and fit them out..... | \$25,000,000 |
| Build 250 110-foot, 18-knot patrol vessels and fit them out..... | 25,000,000 |
| Provide additional guns and ammunition as circumstances indicate.. | 5,000,000 |
| Purchase 100 pairs of mine sweepers and fit them out..... | 10,000,000 |
| Rush work on present dirigibles and build 24 more..... | 1,500,000 |
| Erect air patrol stations as per report of Joint Army and Navy Board. | 1,500,000 |
| Provide bases, floating or ashore, as circumstances require, for patrol forces..... | 5,000,000 |
| Provide antisubmarine nets and torpedo nets..... | 5,000,000 |
| Provide 1,000 buoys, anchors, and chains to make lanes and patrol areas..... | 500,000 |
| Speed up construction of 3 battleships nearest completion, all authorized destroyers, and all authorized submarines..... | 10,000,000 |
| Additional storehouses and depots..... | 5,000,000 |
| Technical experts, draftsmen, clerks, and other necessary personnel. | 250,000 |
| Lay down immediately as many destroyers as shipyards can handle. | 10,750,000 |
| Balance available..... | 10,500,000 |

The CHAIRMAN. These plans were all yours, were they not, Capt. Pratt?

Capt. PRATT. Not alone mine. I wrote them. They were worked up in conjunction with any officer who had any knowledge on that particular subject. They were worked mostly with Capt. Schofield, Capt. Scott, and myself.

The CHAIRMAN. But they were put in by you?

Capt. PRATT. They were put in by me; and one reason why I bring them up is because I was later called upon to execute the very plans that I had been drawing up, so that I knew something about what we were going to do.

I present plan No. 13, mission to establish a policy with reference to the use of mines in the present emergency.

This also, I think, was a plan which was made before the war, because the preliminary discussions of the plans for the northern barrage began by conversations which took place between the officer who was later responsible for most of the work, Commander Fullenweider, in conference with the planning section in Operations.

This plan is as follows:

PLAN No. 13.

MISSION—ESTABLISH A POLICY WITH REFERENCE TO THE USE OF MINES IN THE PRESENT EMERGENCY.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington.

(3)—P. Mission: Establish a policy with reference to the use of mines in the present emergency.

Following an estimate of the situation by Capt. Pratt, the following decisions are reached:

DECISIONS.

(1) That for the purposes of a pure defense, a passive defense can be made more certain than an active offense.

(2) That for the purposes of an efficient offense, a mobile offense is better than an immobile offense.

(3) Keeping the above doctrine in mind, that our objectives in mining are (a) to absolutely protect certain valuable floating and shore facilities lying within vulnerable seacoast areas; (b) not to handicap the ingress and egress of war and merchant vessels, of our own or of our allies, from certain important ports or sea areas; (c) to facilitate every offensive effort that can be made against the enemy submarine, without restricting the activities of any of our vessels participating in this work.

(4) That the best positions in which to employ offensive mining against submarines is directly off their permanent or home bases.

(5) That there are no sea areas on this side of the Atlantic answering the character of permanent or home hostile submarine bases, though there are probably sea areas which could well answer the purposes of temporary bases.

(6) To use only mines that can be controlled or removed at any time, for offensive mining.

(7) To use defensive mines to as limited an extent as possible, and then only when other means such as very heavy nets, gates, and obstructions are impracticable.

(8) That to be an adequate protection to a harbor (since the submarine can cut any wire net), a net must be exceedingly strong and made of other material than wire.

(9) That owing to the impracticability of establishing permanent or movable barriers at all the necessary ports or sea areas, defensive mining will have to be resorted to in certain localities.

(10) Be prepared to adopt the following policy at the below-named ports. In adopting this policy (a) the definite obstruction should be given the first consideration; (b) the mine field should be considered as an adjunct to the definite obstruction, and used only where it is impracticable to do otherwise.

(a) Kennebec River: Movable heavy gate of logs and chains, moved by tugs.

(b) Portland, Me: Same. Stop any entrances except one.

(c) Portsmouth, N. H.: Same.

(d) Boston, Mass.: Block two entrances permanently, use heavy gate across other. Mine flats where necessary.

(e) Narragansett and Buzzards Bay: Mine.

(f) Long Island Sound: Mine heavily, Race Rock to Little Gull. Obstruct all entrances to Fishers Island Sound except one. Gate that. Mine heavily, Little Gull to Gardiners Island, leaving heavy gate entrance off the old fort, on end of Gardiners Island. Use Plum Gut-Gardiners Island passage. Throw heavy gate net across East River near Throgs Neck.

(g) New York entrance south: Block Gedney and Swash Channels. Place heavy log and chain gate across Ambrose Channel. Mine the flats.

Delaware Bay entrance: Heavily mine across the entrance Cape May toward Henlopen. Leave entrance and exit via a movable heavy log and chain gate at Henlopen.

Philadelphia, Wilmington, Chesapeake and Delaware Canal entrance: Mine below canal and establish heavy log and chain movable barrier across narrowest channel adjacent to mine fields.

Chesapeake Bay entrance: Mine heavily across from Cape Charles to Cape Henry. Establish entrance and exit near Cape Henry via a heavy movable log and chain gate. Hampton Roads.

Baltimore: Mine across flats near North Point to channel. Gate the channel.

Washington: Gate the Potomac near Sheridan Point.

Charleston and Savannah: Heavy movable gate obstructions near the breakwaters.

Key West, Mobile, Pensacola, Galveston: Establish heavy mobile gate obstructions to channel near entrances. Mine shoals and flats adjacent as necessary.

New Orleans: Obstruct two entrances. Use heavy mobile gate for third channel.

Port Arthur: Establish heavy mobile gate for channel.

That the above-named ports should receive the first and immediate consideration and arrangements be made locally, for putting the above or similar policy into effect.

12. If it develops that other localities require defensive mining, arrangements should be made through the district commandant for same, but that it should be remembered, defensive mining and obstruction is adopted (a) to protect certain areas which are the logical submarine objectives; (b) that a measure of defensive mining and obstruction relieves the patrol forces, from a passable defensive patrol, and allows them, to a greater measure, to operate offensively and actively against the submarine; (c) that defensive mining in localities where there is no apparent submarine objective, other than temporary basing, is apt to be more harmful to our own forces than to the enemy; (d) that to attempt to adopt defensive mining in localities which might be used as temporary submarine bases, is too elusive an objective.

13. That for the present the use of offensive mining against the submarine, by any except the most mobile and controlled of mines, is too passable an offensive, to give efficient results, in view of the great areas over which the submarine can operate.

14. That the submarine is only a mobile mine, and that the principles involved in the destruction of a mine field (a) locating; (b) sweeping; (c) counter mining, though more difficult of execution, are nevertheless the correct principles to adopt against the submarine.

15. That until more definite data on the subject is received, the antisubmarine efforts of all craft be as actively offensive in character as practicable, and that the efforts of all craft, except those used in safeguarding, shipping and port entrances, and police duties, be directed towards:

a. Scouting for and marking down submarines, their bases and their mines. And to draw a cordon around said craft, by search-curve methods, in order to establish a limit within certain times, beyond which said submarine once marked, can not be.

b. Day air reconnaissance: For locating submarines in conjunction with surface craft.

c. Sweeping for submarines and for their mines with grapnels, anchors, sweeps, mines, or torpedoes, with the object (once the submarine is marked down) of (a) locating, (b) destroying either under water or on the surface.

d. Trapping: By the use of indicator nets.

e. Bombing: By the use of water bombs set for varying depths, and used abundantly in the suspected areas where a submarine is located.

f. Gunning: For surface submarines.

16. That our own submarines, being merely safe mobile mines, should not be used by us (in an active sea offensive) against the enemy submarines until their role can be proven to be more actively mobile and offensive, and less immobile and passive, than it is at present, since such use would serve to handicap the activities of our own craft, which can inaugurate a more active offensive at sea. That if our submarines are to be used offensively against the present enemy, their best use will be as an offensive mobile mine, close up against the enemy probable basing spots, effecting with their torpedoes what the allies are attempting to do with their policy of fixed mines in the neighborhood of and across the entrances to the submarine home and fixed bases.

17. That at his bases, and perhaps on the open sea, the submarine, may be more likely to be caught off his guard, at night, than in the daytime.

Very rough sketch for use of towed mines or water bombs by destroyers or submarine chasers.

That plan goes definitely into details more in relation to what we should do on our own coast. It is very general as to our operation abroad and only later do they come to a definite conclusion in the plan for the northern barrage, which is a separate proposition.

The CHAIRMAN. These are still plans that were submitted before the war?

Capt. PRATT. Yes; this was one, also. When I come to the other I will tell you; because we started armed guards before we actually went into the war. But this plan, I think, is even preliminary to the details that Capt. Scott worked out, and which I submitted to you as the armed-guard plan.

The CHAIRMAN. And the same applies as to being all before the war, to all you have read heretofore?

Capt. PRATT. Yes; to all that I have read heretofore, as well as to these. This plan, No. 14, is as follows:

PLAN No. 14.

MISSION—TO INDICATE THE STEPS TENDING TO MAKE LIFE, SHIPS, PROPERTY OF VESSELS CARRYING ARMED GUARDS SELF-PROTECTING.

CONCLUSIONS.

(1) That in addition to providing guns and efficient armed guards for merchant ships, in order for them to act offensively—defensively against submarines—it is also equally necessary to take purely defensive measures to safeguard (a) life; (b) property (including the ship itself), carried by these merchant vessels.

(2) The first steps taken must concern those vessels now actually engaged in commerce.

(3) Inspection of the reports and accounts of the sinkings of the *Astec*, *Vacuum*, *Rockingham* lead to two conclusions: (a) The armed guard was not efficient (shown in the case of the *Rockingham*, by not immediately attempting to avoid an unknown possible danger); (b) The life-saving apparatus is not efficient (indicated in reports of the *Astec* and in newspaper accounts of the lack of seaworthiness of the *Vacuum* boats).

(4) The first step necessary after providing adequate guns and instructions, is to furnish a personnel capable of handling the guns and of understanding the instructions.

(5) The second step is to give the commander of the armed guard authority to carry the instructions out. This implies naval control of merchant shipping furnished with armed guards.

(6) The third step consists in making the merchant ships provide themselves, or to provide them with (a) efficient lifeboats; (b) excess life rafts in case the weather boats are stove in; (c) efficient life belts; (d) proper equipment for the lifeboats especially in the matter of ration (such as the Navy emergency ration). In the case of lifeboats probably the most efficient type for the service required is the old type lifeboat used in the Life-Saving Service.

(7) The final step concerns (a) the new construction planned for; (b) the construction already built but under repair (such as the seized German ships). These ships must be made as unsinkable as human ingenuity can devise. This is essential.

I do not know whether this was before or after the war. The plan is to make an estimate of the number of merchant ships for such service that it might be necessary to commission as naval auxiliaries to cooperate with the Allies in protecting shipping from German raiders. It has nothing to do with the antisubmarine campaign. This plan is as follows:

PLAN No. 14.

— TO MAKE AN ESTIMATE OF THE NUMBER OF MERCHANT SHIPS FIT FOR SUCH USE IT MIGHT BE NECESSARY TO COMMISSION AS NAVAL AUXILIARIES TO COOPERATE WITH THE ALLIES IN PROTECTING SHIPPING FROM GERMAN RAIDERS.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington.

CONCLUSIONS.

In forming an estimate, to divide the ocean into the following areas which it be considered advisable for the United States to guard, in addition to the forces in Asiatic waters.

- a. North Atlantic to the Azores and to O. Lat.
 - b. South Atlantic, O. Lat. to Cape Horn.
 - c. North Pacific to Honolulu—Aleutian Islands to O. Lat.
 - d. South Pacific to Tutuila—O. Lat. to Cape Horn.
 - e. West Coast of Africa to reinforce allies.
- To estimate on the division of three ships as a working unit, and to determine the probable working bases within each area assigned, as follows:
- a. North Atlantic to the Azores and to O. Lat.
 - (1) 1 division to base—Halifax or Bermuda.
 - (2) 1 division to base—St. Thomas or Trinidad.
 - (3) 1 division to base at the Azores.
 - Total, 9 ships.
 - b. South Atlantic—O. Lat. to Cape Horn.
 - (1) 1 division to base at Bahia or Rio, British or French Guiana.
 - (2) 1 division to base at the Falklands or River Platte.
 - Total, 6 ships.
 - c. North Pacific to Honolulu—Aleutians to O. Lat.
 - (1) 1 division to base at San Francisco, Puget Sound, and Mexican coast.
 - (2) 1 division to base at Honolulu.
 - (3) 1 division to base at Panama.
 - Total, 9 ships.
 - d. S. Pacific to Tutuila—O. Lat. to Cape Horn.
 - (1) 1 division to base at Tutuila, Fiji, New Zealand, and Australia.
 - (2) 1 division to base at Panama, Guayaquil, Callao, and other South America ports if possible.
 - Total, 6 ships.
 - e. West Coast Africa to reinforce allies.
 - (1) 1 division base at Cape de Verdes.
 - (2) 1 division to base at Cape Town.
 - Total, 6 ships.
- Grand total, 36 ships.

That this work should be attempted by an offensive force additional to the and escort force, whose work is in the nature of close in protection for our coasts and shipping in its vicinity.

That to meet the above demand there are at present the following classes of vessels available: Mobilization plan, scout force, divisions 1, 2, 3, 4, and the 5th. In addition (if properly fitted with heavier battery) there are the 3 ships transport class (though it might be wiser to hold in reserve 2 of this class, as per tenders, in view of the great increase in destroyer building). Total naval available, 16.

That therefore there would be required 20 merchant ships to be fitted as naval mines in case the above plan in all its details were carried out.

That therefore 20 to 23 merchant ships (preferably interned ships) of high long endurance, capable of carrying a sufficiently powerful battery of 50-caliber, be inspected, put in readiness, and taken over as naval auxiliaries.

That until such time as these ships be actually required for active cruising they be operated by the Navy in the service of logistics.

That such vessels, when so armed and operated by naval forces in the service, are always their own protection against the ordinary raider.

There is a very detailed plan of operations. This is after the war declared.

Senator PITTMAN. About what date, Captain? Could you approximate it?

Capt. PRATT. Some time in April, very early, because the immediate necessity showed itself of being able to place guns on a great many ships, and we therefore had to take secondary batteries from other ships, and that is the reason why, as Admiral Fullam has stated in his testimony, guns were taken from the Pacific ships, and it became necessary, and not only was it necessary but we found that that was a policy which was a good one, and it is being carried on at present for the simple reason that those lower-deck guns were close to the sea, and it was found that in rough weather the lower ports of the ship were apt to be flooded. And not only did that policy meet the war needs, but that is carried on to-day in most ships, and those guns have never been replaced, because it is better to keep them off.

The CHAIRMAN. What do you mean by saying that the ports were flooded?

Capt. PRATT. In rough weather the sea would come in and sweep the lower deck and come down below; that is, if you had to fight. If you could go into action with all your ports closed and all your hatches battened down, you would not be flooded so much, although the guns would be useless from having the seas sweeping over. That was an error; or I will not say an error, because it was the thought of the day when those ships were built, and they were as good as any better than any of the ships like them in foreign navies that were built before we took to heart the lesson of the sinking of these vessels under Admiral Craddock off the coast of South America, and that was one of the principal reasons for their sinking, that they could not fight in a very heavy seaway, and we had to take that into consideration almost immediately.

The CHAIRMAN. What do you call the lower decks?

Capt. PRATT. What we mean by the lower decks are the main decks; below the turret guns. Our older battleships had that.

We had an estimate of 423 ships that would have to be armed. This plan is as follows:

PLAN No. 15.

MISSION—TO OUTLINE THE GENERAL PLAN WHEREBY THE NAVAL VESSELS MAY BE REQUISITIONED FOR GUNS TO PLACE ON MERCHANT SHIPPING.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington.

Following an estimate of the situation, based on estimates by Capt. Plunkett, Commander Scott, and Lieut. Pickering, of the Bureau of Ordnance, the following general conclusions were reached.

CONCLUSIONS.

- (1) To establish a general policy for the immediate requisitioning of naval guns.
- (2) To base the requisitioning on the number of merchant ships that may have to be supplied.
- (3) First to remove all the 6 and 3 pounder guns and hold them for the use of the small craft in the naval districts.
- (4) In requisitioning guns from a ship, follow this plan: Call for a ship to supply a certain number of guns, and specify the caliber, but leave the decision of the guns to be selected to the individual ship.
- (5) In taking or leaving guns, the following rules to be observed: (1) Take those guns of the medium calibers, which interfere most with the fire of guns better placed.

2 take those guns which can best be spared, having in mind the probable duty of the ship; (3) leave only the minimum number of the smallest caliber guns, that might be needed for a possible submarine defense.

6 That the order of precedence in removing guns from classes of ships should be generally as follows:

- 1 The guns held in reserve.
- 2 The guns of the T. D. battery assigned to the new dreadnaughts.
- 3 Guns from the ships of the Coast Defense Division, not likely to engage in active operations.
- 4 Guns from the old battleships, A class.
- 5 Guns from the scouts (armored and protected cruisers), certain ships in the destroyer flotilla, patrol forces, and train, when the ships are available, for the purpose of removing guns.

7 Guns from the T. D. battery of the dreadnoughts, AA class.

7 That naval auxiliaries (which is to include all merchant shipping taken into naval service for naval uses) should be armed with no less than four high-powered guns, preferably of a standard type, such as the T. D. battery of the dreadnoughts).

8 That armed merchant ships should carry, if possible, four guns and never less than two guns, adequate for the purpose assigned.

9 A general estimate of the shipping (merchant) that might have to be considered in the arming problem, taken from Commander Scott's paper, is as follows:

- Class (1). Those engaged in present Atlantic trade, 70.
- Class (2). Those in other trades that might be diverted to the Atlantic, 175.
- Class (3). Included in class 2.
- Class (4). Vessels that might be taken over as naval auxiliaries:
 - 1 Merchant ships, 50.
 - 2 Yachts (for the patrol force), 50.
 - 3 Coast Guard, 12.
 - 4 Army transports, 14.

Class (5). Available German ships, 102.

Class (6). Vessels enrolled in naval districts.

Class (7). Vessels in the United States coast trade, 165.

Class (8). Vessels in the Pacific trade, 80.

Class (9). New building program (wooden ships), 1,000.

Total that may have to be provided for in the immediate future, classes (1), (2), (3), (4), (5), 423.

10 Following the principles laid down in conclusion 5, the below guns in each class of ship indicated in conclusion 6 are believed to be available.

Class (a) Guns now in reserve (including *Memphis* and *Milwaukee*), 6-inch, 43; 5-inch, 68; 4-inch, 88; 3-inch, 88.

Class (b). Guns T. D. battery for dreadnoughts AA building.

In reserve, .50-caliber, 5-inch: *California* and *Tennessee*, 44; *New Mexico*, *Idaho*, and *Mississippi*, 66; total, 110.

Class (c). Guns from the Coast Defense Divisions:

| Ship. | Take guns. | Leave guns. |
|--------------------|---------------------------|-----------------------|
| Massachusetts..... | 8 3-inch..... | 4 2-inch. |
| Alabama..... | 8 3-inch..... | 4 3-inch. |
| Iowa..... | 6 4-inch..... | 4 4-inch. |
| Oregon..... | 8 3-inch..... | 4 3-inch. |
| Chicago..... | 6 4-inch..... | 6 4-inch. |
| Total..... | 24 3-inch; 12 4-inch..... | 12 3-inch; 10 4-inch. |

Class (d). Guns from battleships A class:

DIVISION 1.

| Ship. | Take guns. | Leave guns. |
|----------------|---------------------------|---------------------|
| Alabama..... | 6 6-inch..... | 4 3-inch; 8 6-inch. |
| Illinois..... | 6 6-inch..... | 4 3-inch; 8 6-inch. |
| Kentucky..... | 6 5-inch..... | 10 5-inch. |
| Kearsarge..... | 6 5-inch..... | 10 5-inch. |
| Total..... | 12 6-inch, 12 5-inch..... | 8 3-inch. |

DIVISION 2.

| Ship. | Take guns. | Leave guns. |
|----------------|----------------|----------------------|
| Ohio..... | 6 6-inch..... | 6 3-inch, 10 6-inch. |
| Maine..... | 6 6-inch..... | 6 3-inch, 10 6-inch. |
| Missouri..... | 6 6-inch..... | 6 3-inch, 10 6-inch. |
| Wisconsin..... | 6 6-inch..... | 4 3-inch; 8 6-inch. |
| Total..... | 24 6-inch..... | 22 3-inch. |

DIVISION 3.

| | | |
|-------------------|----------------|----------------------|
| New Jersey..... | 4 3-inch..... | 6 3-inch; 12 6-inch. |
| Virginia..... | 4 3-inch..... | 6 3-inch; 12 6-inch. |
| Rhode Island..... | 4 3-inch..... | 6 3-inch; 12 6-inch. |
| Nebraska..... | 4 3-inch..... | 6 3-inch; 12 6-inch. |
| Georgia..... | 4 3-inch..... | 6 3-inch; 12 6-inch. |
| Total..... | 20 3-inch..... | 24 3-inch. |

DIVISION 4.

| | | |
|--------------------|----------------|----------------------|
| Minnesota..... | 10 3-inch..... | 6 3-inch; 12 7-inch. |
| Louisiana..... | 10 3-inch..... | 6 3-inch. |
| Kansas..... | 10 3-inch..... | 6 3-inch. |
| New Hampshire..... | 10 3-inch..... | 6 3-inch. |
| Total..... | 40 3-inch..... | 24 3-inch. |

DIVISION 5.

| | | |
|-----------------------------|---------------------------------------|----------------------|
| Connecticut..... | 10 3-inch..... | 6 3-inch; 12 7-inch. |
| Vermont..... | 10 3-inch..... | 6 3-inch; 12 7-inch. |
| Michigan..... | 10 3-inch..... | 12 3-inch. |
| South Carolina..... | 10 3-inch..... | 12 3-inch. |
| Total..... | 40 3-inch..... | 36 3-inch. |
| Grand total, class (d)..... | 36 6-inch; 12 5-inch; 100 3-inch..... | 114 3-inch. |

Class (e). Guns from the scouts (armored and protected cruisers), destroyer and patrol force, and train.

SCOUT FORCE, DIVISION 1.

| Ship. | Take guns. | Leave guns. |
|-----------------|----------------|-------------|
| Charleston..... | 12 3-inch..... | 6 3-inch. |
| St. Louis..... | 12 3-inch..... | 6 3-inch. |
| Total..... | 24 3-inch..... | 12 3-inch. |

DIVISION 2.

| | | |
|-------------------|----------------|------------|
| San Diego..... | 10 3-inch..... | 6 3-inch. |
| South Dakota..... | 10 3-inch..... | 6 3-inch. |
| Frederick..... | 10 3-inch..... | 6 3-inch. |
| Total..... | 30 3-inch..... | 18 3-inch. |

DIVISION 3.

| | | |
|-----------------|----------------|------------|
| Pueblo..... | 10 3-inch..... | 6 3-inch. |
| Pittsburgh..... | 10 3-inch..... | 6 3-inch. |
| Huntington..... | 10 2-inch..... | 6 3-inch. |
| Total..... | 30 3-inch..... | 18 3-inch. |

DIVISION 4.

| | | |
|---------------------|----------------|----------------------|
| Saratoga..... | 8 3-inch..... | 0 3-inch; 10 5-inch. |
| Montana..... | 10 3-inch..... | 8 3-inch. |
| North Carolina..... | 12 3-inch..... | 8 3-inch. |
| Total..... | 30 3-inch..... | 24 3-inch. |

PATROL FORCE.

| Ship. | Take guns. | Leave guns. |
|------------|-------------------------|------------------------------------------------------------------|
| Trile..... | 2 3-inch..... | 8 3-inch, but at least 2 5-inch guns should be added to battery. |
| Salem..... | 8 3-inch; 2 5-inch..... | 0 3-inch and 5-inch.. |
| Total..... | 8 3-inch; 2 5-inch. | |

DESTROYER FORCE.

| | | |
|--------------|----------------|-----------|
| Seattle..... | 10 3-inch..... | 8 3-inch. |
|--------------|----------------|-----------|

TRAIN.

| | | |
|-----------------------------|---------------------------|------------------------------------------------------------------------------------------|
| Prairie..... | 2 3-inch..... | 8 3-inch. |
| Hancock..... | | 6 3-inch. |
| Buffalo..... | | 6 4-inch. |
| | | But at least 2 5-inch guns should be added to battery of all these ships on active duty. |
| Total..... | 2 3-inch..... | |
| Grand total, class (e)..... | 2 5-inch; 126 3-inch..... | 72 3-inch available. |

Class (f) guns from the T. D. Battery of the dreadnaught AA Class:

DIVISION 6.

| Ship. | Take guns. | Leave guns. |
|-------------------|----------------|-------------|
| Pennsylvania..... | 8 5-inch..... | 14 5-inch. |
| New York..... | 8 5-inch..... | 13 5-inch. |
| Texas..... | 8 5-inch..... | 13 5-inch. |
| Delaware..... | 4 5-inch..... | 10 5-inch. |
| Oklahoma..... | 8 5-inch..... | 13 5-inch. |
| Totals..... | 36 5-inch..... | 63 5-inch. |

DIVISION 7.

| | | |
|-------------------|----------------|------------|
| Arkansas..... | 8 5-inch..... | 13 5-inch. |
| North Dakota..... | 4 5-inch..... | 10 5-inch. |
| Florida..... | 6 5-inch..... | 10 5-inch. |
| Utah..... | 6 5-inch..... | 10 5-inch. |
| Total..... | 24 5-inch..... | 43 5-inch. |

DIVISION 8.

| | | |
|-----------------------------|----------------|--------------|
| Wyoming..... | 8 5-inch..... | 13 5-inch. |
| Nevada..... | 8 5-inch..... | 13 5-inch. |
| Arizona..... | 8 5-inch..... | 13 5-inch. |
| Total..... | 24 5-inch..... | 39 5-inch. |
| Grand total, class (f)..... | 84 5-inch..... | 145 5-inch.. |

(11) The following is the approximate general total of guns available for use on the basis of the above policy:

| | 6-inch. | 5-inch. | 4-inch. | 3-inch. |
|----------------------------------|---------|---------|---------|---------|
| Class (a), reserve..... | 43 | 66 | 88 | 88 |
| Class (b), new dreadnoughts..... | | 110 | | |
| Class (c), Coast Defense..... | | | 12 | 24 |
| Class (d), battleships A..... | 36 | 12 | | 100 |
| Class (e), scouts..... | | 2 | | 126 |
| Class (f), dreadnoughts AA..... | | 84 | | |
| Total..... | 79 | 276 | 100 | 338 |

Or a total of 793 guns of all classes which can be spared for merchant ships or auxiliaries in addition to the low-velocity 3-inch, which are adapted for the naval dis-
craft and are not here considered.

(12) The following is the grand total of 3-inch and 4-inch guns left on the vessels above enumerated (those not enumerated not coming in the classes consid-
eligible for requisitioning for guns), which might at the expense of a portion of
submarine defense be spared if it were deemed advisable to draft all the 3-inch
4-inch guns from the A, B, and C classes (battleships, armored cruisers, scouts,
cruisers), 3-inch, 198; 4-inch, 4.

(13) Experience, limited to the few armed American ships that have crossed
Atlantic, indicates that a smaller caliber gun, like a 3-inch, which can easily
quickly be handled in a seaway on a ship that rolls and pitches in any mod-
seaway, is more useful than a more powerful larger caliber gun, but one more diff-
to handle as an antisubmarine menace.

DECISION—(3)—D—IMMEDIATE MISSION.

Adopt the policy that our merchant marine shall be protected against anti-
marine warfare to the utmost and its aims directed toward furthering the imme-
needs of our cooperating allies and our own future needs.

MEMORANDUM RE PAPER OF MR. F. H. FORD TO THE SECRETARY OF THE NAVY—
PORTANCE OF NOW CONSTRUCTING THEREIN (UNITED STATES) A MODERN UN-
STATES MERCHANT MARINE."

The accompanying paper seems in the main thoroughly sound.

In particular is the premise on page 1, and the remarks on pages 8 and 11
curred in.

On page 6, at the bottom of the page, the proposition to limit naval construc-
to 350,000 tons might be all that is absolutely required for the present needs, but
set figure should not be the basis for new naval construction.

Except for the battleships almost completed, which it is believed should be pu-
to completion, the naval demands on construction should be limited to destroy-
chasers, submarines. The first two are indispensable in meeting the subma-
menace, as they are the only types now known that the submarine has any fe-
or which can conduct offensive operations against the submarine.

As for the submarine itself, this type is necessary for our reserve strength in
the present war ends unfavorably for the Allies. Were it an assured fact that
could (through satisfactory arrangements with our Allies) count on an adeq-
allied lump tonnage in submarines, turned over to the United States for her own
in case the United States were left to push the present war through, we might disp-
with submarine building, but the question is too uncertain, and in this one res-
of naval craft the United States must be in a position, if this war ends unfavor-
for the Allies, to impose upon Germany, with our submarines, the same condi-
she seeks to now impose upon the Allies. Hence, the need of the three naval ty-
destroyers, chasers, submarines, and the limits to tonnage, should be what the si-
tion seems to demand—350,000 may be ample, for example:

| | |
|----------------------------------------|-----|
| 100 destroyers, at 1,200 tons, is..... | 120 |
| 34 submarines, at 850 tons, is..... | 29 |
| Total..... | 149 |

leaving approximately 200,000 tons surplus, which represents over 235 850-ton
marines, or otherwise as needed.

It would seem unwise not to complete the almost completed battleships: of w
there are only three. Besides having a reserve fighting value, these vessels hav
a pinch, carrying capacity either in a supply or transport sense, and it would
unwise to waste the efforts already spent on them.

Apart from the above naval types, and with the exceptions above noted, the ac-
panying paper is thoroughly concurred in.

Not only should all construction effort be directed toward the construction of
chant tonnage, but the present facilities should be increased to the limit.

Last, but not least, every effort should be devoted to producing a merchant
which, not only through inner compartmentation, but by outer torpedo explo-
such as blisters, outer-hung plates, lattice framing, etc., be made as nonsinkab-
possible. The mission should be, speed in construction—nonsinkable construc-

W. V. P.

The CHAIRMAN. Will you give the probable date on all of these?

This is the mobilization sheet of April 6, 1917. I happen to have it at date. The order went out to mobilize on that date. It gives the assignment and location of each ship, with the name and type.

Capt. PRATT. No; it does not do that, because it is a mobilization sheet. The repair sheet Admiral McKean has, showing the exact condition on that date of each ship. Those five blue books that I gave you yesterday show, at the places where I put slips between the leaves, at each date, February 1, March 1, April 1, just the condition, and whether the ships were in condition, due to matériel and personnel, because it is a Bureau of Navigation pamphlet. That will show you exactly the material condition.

PLAN No. 16.

Mobilization sheet, Apr. 6, 1917.

The first plan for cooperation with the Allies, which I have marked 17, was April 13, 1917. I have a copy of the dispatch which was sent from the commander in chief of the British naval forces, via the ambassador in Washington to his Admiralty in London. The date is April 13, 1917. This reads as follows:

PLAN No. 17.

FIRST PLAN FOR COOPERATION WITH ALLIES.

[From C. in C. A. & W. L., via ambassador, Washington.]

APRIL 13, 1917.

Your 246: Following points of agreement have been arrived at with United States Navy Department, French admiral sending telegram to Paris. Begins questions raised by British Admiralty.

First. One squadron immediately ready to proceed from North Atlantic port on receipt of information of escape of raider. Operations of ships of this squadron will be

coordinated with those of allied squadrons. Area of operations, from the parallel of Cape Sable to the longitude 50 west, thence south to the parallel of 20 north.

Second. Second squadron on the east coast of South America will be provided as soon as possible in the near future. Area of operations, from Brazilian coast along parallel 5 south to meridian 30 west, thence south to 15 south, then parallel with coast to the latitude of 35 south, then along that parallel to the coast.

Third. Six destroyers will be sent over in the immediate future; these will be based on British or French port, as may be considered most necessary.

Fourth. United States will look after west coast of North America from Canadian to Colombian boundaries.

Fifth. Relations with Chile, excellent. United States armed Government nitrate vessels will maintain continuous service for the present which will be utilized.

Sixth. United States China squadron will be maintained for the present.

Seventh. United States will supervise Gulf of Mexico and Central America as far as Colombian boundary, thence to west point of Jamaica along North coast of Jamaica to the east point of Virgin Islands, thence north to the southeastern limit of area referred to in first.

Eighth. If and when enemy submarine appear they will attempt to send several submarines to the Canadian coast, but this only possible if a parent ship or accommodations of men on shore provided.

Following points raised by French minister of marine:

First. Provision of small patrol for French coast not yet possible owing to requirements of home (?) (defense); when available, however, they will be supplied, France escorting them over and manning if necessary. Every possible effort will be made immediately to supply these; too much reliance should not be placed, however, in early success.

Second. Provision of armed naval transports for carrying (?) (railway material) to France: One will be furnished immediately, a second and third as soon as possible.

Further message transmitted in another cipher:

I will remain at Washington until I know whether you have any further instructions and to complete conference upon details on which I have been requested to advise Navy Department. H. M. S. *Leviathan* proceeds to Halifax. I shall return there by train.

That is signed by the British commander in our waters.

Senator PITTMAN. Captain, before you leave that plan, will you state in what conference this plan was worked out?

Capt. PRATT. I was not present, but it was between Vice Admiral Browning, Admiral Grasset, the General Board, the Secretary of the Navy, the Chief of Naval Operations—I do not know whether Admiral Mayo was there or not—all our leading men and the leading men of France and England.

The CHAIRMAN. April 11, is it not?

Capt. PRATT. April 13 is the date I have on this.

Senator PITTMAN. I wanted to tie it in with other evidence. There was evidence of a conference occurring early in April with the British and French admirals and our operating department, and I wanted simply to see if this was the result of it.

Capt. PRATT. This is the result of it.

The CHAIRMAN. It is the result of the conference of April 11?

Capt. PRATT. Yes, sir; I wanted to say this in connection with that. This is a note of my own:

Admiral Sims's testimony following the agreement of April 13 contains the following passage:

"It will be noted that the agreements except in the third paragraph relate mainly to employment of forces elsewhere than in the war zone, but until I learned of this agreement by accident, I was totally unaware that any conference had been held. I learned from Admiral Jellicoe that he did not regard the agreement as embodying the full answer of cooperation needed from the American Navy, but that the specific arrangements provided for were intended to cover only the situation outside of the critical submarine zone. How it was regarded in Washington, I had no idea."

The CHAIRMAN. From whom is that quoted?

Capt. PRATT. From Admiral Sims in his testimony:

If there were doubts in Admiral Jellicoe's mind on the subject, why didn't he make direct request either through Admiral Sims to us, or via his own representatives here, as to the exact nature of the reinforcements required in European waters, beyond those asked for specifically by the commander in chief of the British forces in North Atlantic waters who had been directed by the Admiralty to confer with the department on this subject.

It was an oversight of operations not to have informed Admiral Sims, but would it not also have been better for the Admiralty to have reinforced Admiral Sims's pleas, in view of the agreement which they knew we had entered into.

I present this plan, which I have marked "18," to establish the policy to be adopted toward the German vessels now lying in our ports. This I think is after the war opened.

Senator PITTMAN. For the benefit of the record: When you say "after the war," you mean after our entry into the war?

Capt. PRATT. After our entry into the war; yes, sir.

Senator PITTMAN. We all understand it, of course.

Capt. PRATT. That was a very loose expression of mine.

The CHAIRMAN. Can you give the probable date of it?

Capt. PRATT. I think it was some time in April or the latter part of May; probably in April, because in May I was very busy executing some of the plans that I had been instrumental in drawing up. We were so short of men to really carry on things that you sometimes had to take up a plan and just walk away with it; in other words, you had to promote the very plan which you had drawn up, which in one case I did. And Capt. Scott picked up his armed-guard plan and walked away with it. He actually executed it.

The CHAIRMAN. Will you refer to that later when you come to it?

Capt. PRATT. Yes, sir; I will. This plan is as follows:

PLAN No. 18.

MISSION—ESTABLISH THE POLICY TO BE ADOPTED TOWARD THE GERMAN VESSELS NOW LYING IN OUR PORTS.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington.

a) As regards the vessels having a national character.

b) As regards the interned merchant vessels.

Following estimates of the situation by Commander Schofield and Capt. Pratt, the following decisions were reached:

DECISIONS.

(1) That this country having, in the President's proclamation, set for itself certain standards whereby in the existing laws enemy property rights, the safety and freedom of enemy human life, is to be respected and safeguarded to the limit compatible with the public welfare, it can not with dignity maintain other than this steadfast course of conduct.

(2) That the laws of necessity and of might do not make right, when the actuating motive is aggression and not defense.

(3) That for reasons of public defense, caused by the enemy's aggressive actions, it is correct to invoke the fundamental law of self-protection, and that such law is good law, if special treaties be abrogated by us or be abrogated automatically by the enemy through his actions toward us.

(4) That cause for retaliation, due to the enemy's treatment of our ships and citizens, and due to his own hostile acts within our own ports, does exist, but that it would be more in keeping with our dignity if we acted lawfully, rather than in the spirit of retaliation.

(5) If it becomes necessary for the public good that the German vessels lying in our ports be seized by us, that such an act partake of a lawful act rather than as an act of retaliation.

(6) That such necessity does exist now; that we take over the German ships lying in our ports (a) for our own public safety; (b) for our own use, due to the fact that Germany, in disregard of all law, having sunk so many of our own ships has rendered such a course necessary for the public good.

(7) That the German Government having shown an entire disregard for all law, we are entitled in self-defense to abrogate any special treaties we may have with her and to turn to the fundamental law or self-protection, in our attitude toward her.

(8) That it is a physical impossibility, owing to the acts of the German officers and crews themselves, to invoke the 24-hour precedent (hitherto allowed by the rules of international law) in behalf of the German ships now lying in our ports.

(9) That therefore it would be policy to abrogate any special treaties we may have with Germany, provided she has not already abrogated the same by her own acts; and then to seize all the German ships under an Executive order.

(10) That having seized all the ships, they should be taken over by the Navy, manned, gunned, commissioned, and operated by the Navy to further the ends of the most pressing immediate need, which is (to preserve the line of supplies to our allies) in accordance with the following plan: First. Taken over: By Executive order. Second. Inspected: By naval men for the purpose of repair, fit and commissioning. Third. Distributed: To the various yards and repair shops for repair. Fourth. Repaired: This work to take precedence over all other work except that of building destroyers and submarine chasers. Fifth. Armed: With not less than four naval guns of caliber not less than 5 inches. Sixth. Commissioned: Commissioned and manned by naval crews and officers. Seventh. Operated: As munition and supply ships across the Atlantic, under the direction of the Navy Department, but in co-operation with the shipping authorities. Eighth. Reimburse: To seize and hold the vessels of purely national character; later on, as an act of policy and kindness and consonant with our principles, the private owners of ships having a purely private character should be reimbursed.

APRIL 7, 1916.

Plan as to vessels of German Navy in United States ports:

1. Survey them, with a view to placing them in service.
2. Place the converted merchant vessels in service as naval auxiliaries, officers and manned by the Navy.

Plan as to refugee German ships in United States ports:

1. President to issue an Executive order (not to be published), placing all refugee German merchant vessels in custody of the Navy for service.
2. Continue present guards until Navy is ready to take over.
3. Navy survey, repair, and place in service all vessels as naval auxiliaries.
4. Determine order in which vessels will become available.
5. Navy to officer and man all vessels.
6. Assign to each vessel a minimum battery of four guns.
7. Arrange with existing trans-Atlantic shipping companies to handle the commercial shipments abroad, the Navy to operate the vessels.
8. Inventories and accounts of repairs to be kept, in order that the Government may be in a position to make such adjustments as policy may dictate later.

APRIL 7, 1917.

Memorandum:

I find no authority of treaty or law justifying seizure of vessels except by a general embargo, which, of course, can not be considered. This being the case, the decision must be founded on conditions that exist. These are:

- (1) The vessels can not put to sea.
- (2) Their crews are not on board, and the vessels are in the main disabled.
- (3) It is well known that German crews would destroy these vessels if they had further opportunity.
- (4) Success in the present war is dependent on shipping. Ninety enemy ships are in our power. It is impossible for them to return to their own country.
- (5) Imperative military necessity requires that these vessels render service and that they shall be diverted into the service that, for the present at least, will be most effective—the trans-Atlantic trade. There is no certain way of putting them in this trade except by placing them under complete naval control.
- (6) I consider it undesirable, for many reasons, for the Navy to do anything other than operate these vessels at sea.

Nineteen is a plan for fuel oil for naval purposes.

The CHAIRMAN. Have you the probable date of that?

Capt. PRATT. It was some time in April, I should say.

The CHAIRMAN. After we had gone to war?

Capt. PRATT. Yes. It may have been earlier, but it is not a very material plan. It is as follows:

PLAN No. 19.

MISSION--FUEL OIL FOR NAVAL PURPOSES.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington.

Subject. Fuel oil for naval purposes.

Reference: Paper from Rear Admiral J. R. Edwards, United States Navy, March 6, 1917.

A study of this very valuable and able paper leads, in summarizing the whole subject matter, to certain conclusions.

CONCLUSIONS.

1. For fleet tactical purposes alone, the use of oil is superior to the use of coal.
2. For economic reasons the use of coal for fleet purposes is probably now and in the future will be cheaper than the use of oil.
3. The United States is in the position of favored nation, when balancing economic against strategic or tactical reasons, internally. She is in the same position, externally, when balancing her economic condition against that of any other nation in the world.
4. In its control of the oil of the world, the United States is in the position of favored nation. As regards the rest of the world its control of oil is in a greater ratio than its control of coal.
5. The use of oil alone for fleet purposes must be dependent upon several factors:
 - a. Available supply at source (at home or controlled).
 - b. Control of that supply for fleet purposes.
 - c. Ability to receive supplies when operating away from source (at home or controlled).
6. The use of coal for fleet purposes is dependent upon the same factors mentioned in 5.
7. The statement on page 57, "The more thoughtful and conservative recognized authorities upon petroleum are practically in accord in the belief that the limit of production in the United States has substantially been reached," is an excellent expression of competent opinion, but it is not a definite statement of the amount of oil on hand, or in sight, or if the amounts on hand or in sight will be ample for fleet uses for a number of years ahead.
8. The statement on page 100, "The Navy should immediately obtain the permanent services, in an advisory capacity at least, of one eminent civilian petroleum technologist," seems sound.
9. If, after expert investigation, the conclusion is or has been reached that the available oil supply under our control, at source, is sufficient for present fleet needs with a good outlook in the future, for a reasonable term of years, then this should be made the basis for decision, that the fighting fleet units be oil burning.
10. If, after expert investigation, the conclusion is or has been reached that the available oil supply under our control, at source, will not be adequate for fleet needs for a reasonable number of years ahead, then this should be made the basis for a decision that our fleet revert either to (a) coal burning or (b) oil and coal burning.
11. Because the above reason (aside from commercial reasons) is the only real controlling reason in the case, once (a) the tactical superiority of oil is established; (b) an understanding is reached that oil and coal alike must be treated as supplies, and that the matter of supply is a matter of logistics, incident to any operations, whether military or naval, conducted away from well-established base.
12. If the condition outlined in paragraph (10), exists, then it will be necessary, first, to revert to condition (b), coal and oil burning; and, second, to condition (a), coal burning, for fleet fighting units.
13. If it becomes necessary to revert to condition (b), oil and soft coal burning, then the two schemes offering the best solutions seem to be: (a) Boilers separately fitted for

oil and coal, with the purpose of using both oil and coal separately but at the same time when necessary; (b) boilers built to use either coal or oil independently, but so fitted that if oil is being used, a transfer to coal burning can be effected with certain boiler changes, of a minor character, or vice versa.

(14) Of the two schemes outlined above and taken from the reference paper—

(a) No. (1) is more economical than No. (2)—for alteration in construction reasons—for ordinary steaming reasons, unless No. (2) scheme contemplates the constant use of coal.

(b) No. (1) gives practical training in the use of both oil and coal, which No. (2) does not.

(c) No. (1) requires no prewar changes, or only a partial prewar change, per each large fighting unit, to return entirely to oil, while No. (2) scheme requires entire prewar changes, per boiler per ship, unless oil had previously been used entirely, in which case we are back to our original proposition, now under consideration, of the inadvisability of using oil as a fuel for our fighting units entirely.

(15) Whatever we use, whether oil or coal, or both at the same time, the question of adequate advance preparation, in the matter of bases, reserve supplies, facility of transport, is vital and much the same, whatever propelling agent we use.

(16) If, through lack of adequate oil supply, it becomes necessary to revert to schemes similar to those outlined in paragraph 13, then it should be the constant aim (a) to keep certain reserve supplies of oil constantly on hand, on board ship; (b) be equipped with boilers, so fitted, that with the supplies carried on board, and in a minimum space of time the ship could, with her own resources, change from coal to oil burning.

The next is a plan to outline a general scheme for efficient cooperation in information, plans, and operation. This was made, I think, very early in April. Really, it was on the basis of this that the reorganization in the Office of Operations practically took place; partial reorganization, but more correctly and accurately stated, an expansion.

The CHAIRMAN. Was this after the declaration of war?

Capt. PRATT. I think it was very shortly afterwards. I carried it into effect myself after I became aid for Operations, to a very large extent; but it was gradually developing all the time, and there is no one man who is responsible for the increase in that office; the Plans Section, the Material Section, especially under Admiral McKean; such officers as Admiral McKean and Commander Carter, Admiral Benson's aid, and Admiral Belknap, who took up the whole merchant ship proposition and expanded it and created an office within our office; such men as Commander Ingersoll, who took up our communication system and expanded it to meet the needs of the war; Wilson Brown, Todd, Admiral Osterhaus, Capt. Marvell, Capt. Blakely, Capts. Schofield and McNamee, Yarnell, Evans, McCauley, Hart, Bristol, Gormhley, and Crenshaw in the Submarine Section, and particularly Capt. Gilpin, who really took the card index system and made a visible operation section so that we could conduct our operations visibly in the same way that a staff conducts its operations in the field. That is the base plan of it. That must have been very early in April. I made it out myself, and I carried it into effect.

The CHAIRMAN. Probably after war was declared?

Capt. PRATT. Oh, yes; the office was running. But of course it was on a peace basis before that time. We had to expand a great deal. This plan is as follows:

PLAN No. 20.

MISSION—TO OUTLINE A GENERAL SCHEME FOR THE EFFICIENT COOPERATION OF INFORMATION—PLANS—OPERATIONS.

Following an estimate of the situation the following conclusions were reached:

1. That there shall be kept in the operating room a graphic record of operations, as follows: (a) A fleet-movement sheet. (b) The information sheet. (c) The district sheets. (d) A sheet showing the movements of merchant shipping. (e) Working sheets. (f) A card-index system of recording all movements, orders, information, and general instructions.

2. (a) *Fleet-movement sheet.*—The fleet-movement sheet shall show in appropriate manner the general movements of our naval forces, and the enemy movements. When more detailed accuracy is needed, as in the specific direction of naval forces or of merchant shipping, the necessary details will be worked out on the working sheets, and the movements as they occur transferred to the fleet movements and movements of merchant-shipping sheets.

3. (b) *Information sheet.*—The information sheet should give the following information: (1) Information of our own naval forces. (2) Information relating to enemy naval forces. (3) Information relating to naval defense districts and cooperate activities of a general character. (4) General information. (5) Information of a military character. (6) Information relating particularly to merchant shipping, general in character.

4. The scene upon which the (a) fleet movement sheet and (b) the information sheet, should be laid, is an enlarged chart of the world, taking in all areas where movements of ships may occur and where information may be obtained. Upon this chart should be entered, in advance, all information liable to be constantly referred to, and the names of all the places liable to be used by vessels of our and the enemy fleets.

The working sheets, involving more detailed operations, will naturally be limited to that section of the world immediately under consideration.

5. On the fleet-movement sheet it should be possible (under the system devised) to identify individual ships; also entire organizations and parts of organizations. The sight areas upon which the two forces are laid down should be broad enough to give an outline of the enemy's probable policy and strategic objective. The working sheets should be sufficiently detailed to permit of tactical deployment and the development of the enemy's tactical plans.

6. The information sheet should be kept up in a graphic manner by daily additions and changes, so that at a glance the trained observer can immediately place: (1) The various kinds of information available. (2) The order of its importance. (3) The date when it occurs. (4) Where it occurs. (5) A brief outline of its character. (6) Where the information is filed. (7) Whether immediate action is necessary.

7. Information is intimately connected with plan and movement, and can in no wise be separated with efficient results. It is the food which stimulates creative production, and it furnishes the guides to the roads movement should follow. The graphic representation of information and its cooperation with movement and plan: (1) Relieves the mental processes at times when those processes need relief. (2) Helps the mental faculties to concentrate when concentration becomes necessary. (3) Permits the entire picture to come into the vision, so that the broad outlook is not lost. (4) Permits of detailed inspection when detail is required. (5) Allows no detail to escape the memory. (6) And above all it preserves that continuity between the past, present, and future which is so essential to well-balanced, connected plans and to the efficient administration of them.

8. (c) *The district sheets.*—The district sheets should be kept up in such a way that it is possible to obtain from them a fairly succinct synopsis of daily events at a glance. Owing to the variety of operations and the infinite number of movements within each district, due to the great number of small craft and their relative unimportance, it will probably be impossible to keep such a sheet up to date after the manner of a fleet-movement sheet. But if at the end of each day, week, or specified time a miniature chart of the district were submitted by the commandant, indicating—(1) the extent and character of operations; (2) the general plan of action and field of operation for each distinct force; (3) the positions of important events, with time, date, and forces involved; (4) the location of enemy forces; (5) the extent of cooperation with other forces; (6) an accurate account of entrance, exit, and control of merchant shipping; (7) any further pertinent remarks of importance—then a very fair graphic representation of naval activities within each district would be had, and such information would be of great value.

9. (d) *Movements of merchant shipping sheet.*—There is at present kept up an administrative sheet showing the names of the merchant ships that have applied for

armed guards, the guns assigned, etc., but there are no sheets which (a) keep track of the movements of merchant ships, or (b) furnish them with information of a military nature for their guidance, similar to the pilot charts furnished as navigational aids. In view of the fact that the submarine, mine, and raider are now greater menaces than any of the dangers depicted on the pilot charts, the value to the mariner of such a chart as (b) above is evident.

If later on naval control over the movements of merchant ships is introduced, the value of a merchant-ship movement sheet, such as indicated in (a) above is evident, and it will record in graphic form the directions issued to each merchant ship plying within the areas of naval control.

(10) (e) *Working sheets*.—There must be working sheets upon which are depicted in appropriate manner. (1) The fleet strategic plans. (2) The fleet tactical dispositions and events as they happen. (3) Sheets upon which can be worked out such directions as it may be necessary to give to merchant shipping in safeguarding it across the Atlantic.

There must be an intimate connection between the working sheets mentioned in (1) and (2) and the fleet operation orders, and any radio messages sent or received by the fleet or by operations. Appropriate means for temporary file near the working sheets must be provided, in order that no necessary information be lost or neglected, and to afford a check. But these files are merely for the purpose of conveniently handling the immediate work at hand, and do not replace the permanent card-index file. Sheet (3), for the merchant shipping bears an intimate relation to the "district sheets sent out by the district commandants" to operations and to the "Pilot chart of information sent out by the district commandants" for the benefit of merchant shipping.

(11) (f) *Card-index file*.—For a permanent system extending over years, including peace-training maneuvers as well as actual war operations, some form of card-index system for ready reference is necessary.

NOTE.—The details for the fleet movement sheet, and for the information sheet have been worked out.

Then I have a plan, to outline the best general plan to get troops to the western front——

The CHAIRMAN. In each case I wish you would give the probable date.

Capt. PRATT. This was about the 1st of April.

Senator PITTMAN. In each case, when you speak of the 1st of April, you mean 1917?

Capt. PRATT. Yes.

The CHAIRMAN. Do you mean before the war?

Capt. PRATT. Yes. I am merely showing you some of these plans to show you that we had some preparations.

The CHAIRMAN. I want to know whether it was before the war or after we entered the war, in each case.

Capt. PRATT. Well, I conceived of it before the war. I probably wrote it after the war. This is not particularly important. It did not go into effect during the war, but the gist of it was put in effect after the armistice, because they used these very ships that were indicated to bring our troops home. It was not a real operational plan. It is as follows:

PLAN No. 21.

Mission.—To outline the best general plan to get troops to the western front.

Following an estimate of the situation, the following conclusions were reached:

(1) That the above order of precedence expresses the needs of the immediate situation, because—

- (a) The efficient offensive is an offensive which must be directed solely and whole-heartedly at the immediate threatening enemy menace, which is the submarine menace.
- (b) The submarine menace threatens the life of logistics and the great supply arteries to the warring allies, both in their homes and at the front.
- (c) In the ultimate issue, the deciding factor tending to end the war will be a favorable military decision on the western front.

That the above order of precedence expresses the needs of the immediate situation, because—(Continued).

(d) Like supplies, the arrival of reinforcements must be as certain and as sure as the existing state of affairs will permit.

(e) The actual pressing needs of the immediate situation in offensive effort, supplies, and reinforcements must take precedent over any possible conjectural future contingency.

That in viewing the problem of this war as a whole from the broadest naval and military points of view, with an eye to determining our part in it, the following facts come out:

(a) The main arena of war is and will continue to be the western frontier of Europe, including the bordering oceans.

(b) In that arena there are: (1) Two offensive fighting lines, one furnished by the Army on land, the second composed of those naval units capable of conducting an offensive against the enemy water offensive (his submarine operations). (2) Two containing forces, composed of both naval and military units, the Army being in the nature of a tactical containing force, while the allied fleets form a strategic containing force. (3) A reserve which is composed of nations, armies, naval forces held in positions of readiness from which at the opportune time they may be launched most efficiently against the enemy. That our entry in this war has placed us primarily in the rôle of the reserve, until such time as efficient cooperation with the Allies demands that we assume some rôle in the offensive line. (4) A line of supply for reinforcements of men and supplies of food and munitions. This is the rôle (aside from a somewhat minor offensive), which our naval forces in the reserve can at first play an eminent part by (a) maintaining the food and munition supply line, by building, arming, and manning the merchant shipping available.

(c) Furnishing offensive forces where offensive forces may be useful, such as against enemy submarines and raiders. (d) Safeguarding the transport of the military forces sent to the front.

It is a fact that the submarine campaign has severely taxed and strained logistics and matter of supplies. It is a further fact that the transport of military forces to the front will increase the present tax—

(a) By making the demands for supplies at the front greater.

(b) By making demands for transport service on the merchant shipping already strained by logistic demands.

There then remains but one class of vessel, whose present services are not in demand either for offensive work or for the service of logistics, but which are held in reserve for a future contingency. This call may be—

(a) To conduct a legitimate offensive of their own before this war is ended.

(b) To assist in the service of supply and transport during this war.

(c) Caused by the unsuccessful termination of the present war.

(d) Caused by unforeseen or new complications arising or brought to a focus after this war.

The class of vessels referred to are the naval warships of the major type—battleships and armored cruisers.

That of all the demands outlined in paragraph 4, (a), (b), (c), (d), the paragraph at (b) will make the first demands and probably the most pressing demands. As the nature of the demand will probably be so great that even with regard to major fighting ships, it will have to be removed from the class of future contingencies and placed in the immediate present. This then leaves (a), (c), (d) as contingencies.

That the future contingency does not warrant us in sparing any portion of our fleet from the immediate work at hand, or of withholding any of our major ships from the service in the line of supply, for—

(a) It furnishes most excellent training, and morale to meet the future situation, as reserves to the allied fleets.

(b) Were the present war to end unsuccessfully, our best reply to that condition is the submarine campaign, waged by our naval forces, on similar but humane lines and our Army well trained through universal service.

(c) If through complications arising after this war, with a fresh antagonist, we were forced to engage in a fresh war, the submarine and the universally trained Army are still the Nation's best defensive assets, leaving our country safe even if at first forced to adopt a defensive instead of an offensive rôle.

(d) The reason that our whole-hearted participation in this war, now we are in it, is likely to leave us in a more favorable position, in regard to future wars, than any half-hearted cooperation could possibly do.

(7) That therefore of all our naval forces now held in the reserve; the one which we must guard carefully and maintain for our own defense, as an offensive defense; the one we can least spare, and the one which must be built up trained to the minute and held for our own purposes, is our submarine force.

(8) That therefore if the demands of the supply line become so great that our merchant shipping can not be withdrawn from the service of supply to the service of transport of troops, then will the armed ships of the Navy with its major units have to undertake the service of the transport of troops.

(9) That for the purpose of safeguarding the passage of troops, the heavy armed and fast naval vessels, are the safest carriers, and therefore the surest.

(10) That the same objections exist to transporting troops by the convoy method en masse, as exist in the transport of supplies.

(11) That the fast heavy armed ship is to some extent its own defensive convoy against such enemies as raiders, but to further insure its immunity against submarine attack it would be wise to escort such vessels (if practicable) by the craft that constitute the submarine greatest menace.

(12) Therefore the instant the demand is made to transport our military forces to the front, for offensive action, unless our own naval major ships can themselves be used in offensive action, against their proper foes, that they should be used in offensive action, against their proper foes, that they should be used in the service of the line of supply, to transport troops, in the following order of their naval effectiveness:

- (a) The dreadnoughts.
- (b) The armored cruisers.
- (c) The older battleships.

(13) That in this service of transport, no attempt should be made to congregate at certain home points of embarkation, great numbers of troops and not to wait until this congregation of the military forces was an assured fact, in order to start the journey together, but that the most effective and surest means of getting the military forces across the water, also the quickest, is to observe the following rules:

- (a) Select different points of embarkation.
- (b) Collect only at the points of embarkation, such complete organizations as will make the immediate passage.
- (c) Sail individually.
- (d) Sail secretly.
- (e) Make the passage at speed.
- (f) Arrange for the grand assembly and final adjustment of organizations of troops to take place on the other side, not on this side.
- (g) If destroyers or appropriate craft can be spared from the service of offense, escort the major transporting ships by units not to exceed 3 escorting small craft, for each major ship.

(14) While making passage, strip the naval vessels of such part of its crew:

- (a) Not needed for running.
- (b) Not absolutely needed for training.
- (c) That due to the service of transport, with an eye to contingencies, it was felt might be spared for the particular voyage in question.

(15) Leave in the shore training camps, from each naval vessel, a sufficient personnel of officers, to insure the efficient training of the shore group, during the time of passage of the ship.

(16) Shift the ship and shore groups, whenever it is deemed necessary.

This was a plan which we started working on, I should think, about the first part of May or the last part of April. It took a great deal of time to get it through, to get the required approval from Mr. Denman, who was then on the Shipping Board, and to get the signatures of the Secretary of War and the Secretary of the Navy. It was something which had to receive the cooperation of both the Army and the Shipping Board, as well as ourselves, and the details are not here, but the proclamation was itself signed (I handled this myself) in July 12, 1917, and the names of the ships taken over, the German ships, the troop transports, and that is the transport plan that we began to operate under [reading]:

PLAN No. 22.

[Joint letter.]

WAR DEPARTMENT—NAVY DEPARTMENT,
Washington, D. C.

From: Secretary of War and Secretary of the Navy.

To: The President.

Subject: Transports to be commissioned in the Navy.

1. After consultation, the War and Navy Departments jointly recommend that the following-named ex-German vessels be commissioned in the Navy for transporting troops and munitions during the continuance of the present war:

| | |
|---------------------------------------|--------------------------------------|
| Leviathan—Vaterland. | Neckar—Antigone. |
| Mount Vernon—Kronprinzessin Cecillie. | Rhein—Susquehanna. |
| Memnon—Kaiser Wilhelm II. | Princess Irene—Pocahontas. |
| George Washington—George Washington. | President Grant—President Grant. |
| Amerika—America. | Cincinnati—Covington. |
| Powhatan—Hamburg. | President Lincoln—President Lincoln. |
| Aeolus—Grosser Kurfurst. | Frederick der Grosse—Huron. |
| Madawaska—Koenig Wilhelm II. | Barbarossa—Mercury. |

2. The War and Navy Departments jointly recommend further that should it be found necessary to take over additional vessels for permanent employment as transports during the present war vessels so taken over shall be commissioned in the Navy.

W. S. BENSON
Chief of Naval Operations.

JOSEPHUS DANIELS,
Secretary of the Navy.

TASKER H. BLISS,
Chief of Staff.

NEWTON D. BAKER,
Secretary of War.

THE WHITE HOUSE, July 12, 1917.

Approved:

WOODROW WILSON.

I submit this plan, which I have marked 23. This was the first part of April. It did not have anything to do with the war, as it turned out.

The plan referred to is as follows:

PLAN No. 23.

MISSION—THE NAVAL POSITION AND NEEDS IN THE MATTER ON PANAMA REPUBLIC,
WITH SPECIAL REFERENCE TO THE DEFENSE OF THE CANAL.

NAVY DEPARTMENT, Washington.

Memorandum prepared for State Department, May 19, 1917.

W. V. P.

OPERATIONS.

Memorandum for the State Department.

The naval position and needs in the matter of Panama, with special reference to the adequate defense of the canal:

(1) The primary position of the Navy with reference to the defense of the canal is largely a matter of strategy, and the first question is the proper location of the fleet, either in the Atlantic or the Pacific. To effect this the integrity of the canal must be assured.

(2) As a base of supply for the fleet, acting in accord with the above mission, the Panama area is of prime importance, and is centrally located, for certain naval activities. However, such a base will be in the Canal Zone itself, and within the present fixed fortifications.

(3) To effect the local defense of the canal there must be—

(a) An adequate local military and naval defense of the entire Panama area.

(b) Efficient cooperation between not only the military and naval forces of the United States stationed in the zone, but also between the United States forces in the zone and the inhabitants of the Republic of Panama, in order that their reserves of supplies and men may be thrown into the balance with the United States and

(7) That therefore of all our naval forces now held in the reserve; the one which must guard carefully and maintain for our own defense, as an offensive defense; the one we can least spare, and the one which must be built up trained to the minute and held for our own purposes, is our submarine force.

(8) That therefore if the demands of the supply line become so great that our merchant shipping can not be withdrawn from the service of supply to the service of transport of troops, then will the armed ships of the Navy with its major units have to undertake the service of the transport of troops.

(9) That for the purpose of safeguarding the passage of troops, the heavy armed and fast naval vessels, are the safest carriers, and therefore the surest.

(10) That the same objections exist to transporting troops by the convoy method en masse, as exist in the transport of supplies.

(11) That the fast heavy armed ship is to some extent its own defensive convoy against such enemies as raiders, but to further insure its immunity against submarine attack it would be wise to escort such vessels (if practicable) by the craft that constitute the submarine greatest menace.

(12) Therefore the instant the demand is made to transport our military forces to the front, for offensive action, unless our own naval major ships can themselves be used in offensive action, against their proper foes, that they should be used in offensive action, against their proper foes, that they should be used in the service of the line of supply, to transport troops, in the following order of their naval effectiveness:

- (a) The dreadnoughts.
- (b) The armored cruisers.
- (c) The older battleships.

(13) That in this service of transport, no attempt should be made to congregate at certain home points of embarkation, great numbers of troops and not to wait until this congregation of the military forces was an assured fact, in order to start the journey together, but that the most effective and surest means of getting the military forces across the water, also the quickest, is to observe the following rules:

- (a) Select different points of embarkation.
- (b) Collect only at the points of embarkation, such complete organizations as will make the immediate passage.
- (c) Sail individually.
- (d) Sail secretly.
- (e) Make the passage at speed.
- (f) Arrange for the grand assembly and final adjustment of organizations of troops to take place on the other side, not on this side.
- (g) If destroyers or appropriate craft can be spared from the service of offense, escort the major transporting ships by units not to exceed 3 escorting small craft, for each major ship.

(14) While making passage, strip the naval vessels of such part of its crew:

- (a) Not needed for running.
- (b) Not absolutely needed for training.
- (c) That due to the service of transport, with an eye to contingencies, it was felt might be spared for the particular voyage in question.

(15) Leave in the shore training camps, from each naval vessel, a sufficient personnel of officers, to insure the efficient training of the shore group, during the time of passage of the ship.

(16) Shift the ship and shore groups, whenever it is deemed necessary.

This was a plan which we started working on, I should think, about the first part of May or the last part of April. It took a great deal of time to get it through, to get the required approval from Mr. Denman, who was then on the Shipping Board, and to get the signatures of the Secretary of War and the Secretary of the Navy. It was something which had to receive the cooperation of both the Army and the Shipping Board, as well as ourselves, and the details are not here, but the proclamation was itself signed (I handled this myself) in July 12, 1917, and the names of the ships taken over, the German ships, the troop transports, and that is the transport plan that we began to operate under [reading]:

NAVAL POSITION

From: Secretary of War and Navy
To: The President.
Subject: Transports to be constructed

1. After consultation, the War and Navy Departments have determined that the following-named ex-German vessels were used to transport troops and munitions during the war:
- Leviathan—Vaterland.
 - Mount Vernon—Kronprinzessin.
 - Agamemnon—Kaiser Wilhelm.
 - George Washington—George Washington.
 - Amerika—America.
 - Powhatan—Hamburg.
 - Aeolus—Grosser Kurfurst.
 - Madawaska—Koenig Wilhelm.

2. The War and Navy Departments have found necessary to take over additional transports during the present war.

W. S. BENSON
Chief of Naval Operations
JOSEPHUS DANIELS
Secretary of the Navy

THE WHITE HOUSE, July 22, 1917
Approved:

I submit this plan, which was submitted in part of April. It did not turn out.

The plan referred to is as follows:

MISSION—THE NAVAL POSITION
WITH SPECIAL REFERENCE TO THE PANAMA CANAL

Memorandum prepared for the President

Memorandum for the President

The naval position and the adequate defense of the Panama Canal.

(1) The primary position is largely a matter of strategy. The fleet, either in the Atlantic or the Pacific, must be assured.

(2) As a base of supply, the Panama area is of prime importance for military activities. However, the present fixed fortifications are inadequate.

- (3) To effect the local defense of the Panama Canal:
- (a) An adequate local force.
 - (b) Efficient cooperation between the United States station and the zone and the installation of supplies and other facilities.

y, or unless a new military

arrying merchant ships to be
such construction cramps the

against any probable enemy until such time, at least, as the United States may be able to send the necessary forces of its own.

(c) The absolute safeguarding of either one of the two routes of passage from the United States to Panama, via the Atlantic, via the Pacific, together with the complete security of the two terminal ports of disembarkation.

(4) The relations of Panama to the United States in a military and naval sense are comprised in paragraph (3).

(5) The first main essential in our relations with Panama, from a military and naval point of view, is hearty and efficient cooperation. To effect this much depends upon—

(a) The character of the heads—diplomatic, military, and naval—we send to this country. These people are extremely susceptible to courtesy, and without it we will not get far. They also have many quite able men conducting their affairs.

(b) The practical aid we give them in the matter of loans, etc.

(c) The extent and character of our efforts to win their support, and to make their efforts coincide with our own.

(6) The second essential from the military and naval point of view is the question of transportation of the troops locally stationed on the zone and their ability to move quickly from any point within the Canal Zone to any threatened point within the Republic whose integrity is vital to the integrity of the canal.

This is immediately a question of roads, and this is also the first purpose toward which any loans we may make should be directed. The two most necessary roads are roads paralleling the Pacific coast line—one toward Chepo, one toward Montijo Bay. A third road might parallel the northeastern Atlantic coast line toward Porto Bello or beyond. The northwestern Atlantic coast line toward Chiriqui is as yet too undeveloped to warrant the first expenditures for roads in this direction.

(7) The next essential is the development of the resources of Panama, to enable it to become a reservoir of supply for our forces stationed in the Canal Zone. Beyond the acquisition by the United States of the lands of Panama now under consideration (with perhaps a few minor exceptions), it is not believed that the policy of expropriation should extend further than it already has. The defense of the canal depends less upon the expropriation of Panama lands by the United States than it does upon a hearty and efficient cooperation with its people and their willingness to enter with us into any defense we consider necessary, extending even to the very borders of the Panama Republic itself. To effect this last purpose, we must have the right when the military necessity arises (a right we possess now under the terms of the treaty) to temporarily occupy with military forces any lands within the entire Republic, or any of its waters, with our naval forces.

To develop the resources of Panama, that they may become ample and available for our forces operating from the Canal Zone as a center, transportation to and from this center is a first requisite.

(8) Another essential to defense is the development of the system of communications within the Republic. This includes radio telegraph, cable, and telephone systems.

(9) The prime essential to a protracted defense of the Canal Zone lies in the ability of the United States to control one ocean and the terminal facilities of the canal bordering on that ocean. A second equally important essential is the ability of the United States to furnish reinforcements of troops, ships, and supplies, delivered at the canal terminals within the time they are urgently needed. These are matters concerning principally the United States, with which Panama is little concerned except as to results.

(10) As far as the Navy itself is concerned, beyond the right to use the waters of Panama as it sees fit, when necessity arises involving any question of the defense of the Canal Zone (a right it now possesses, or, if not clear as to point of law, which it should possess), there is but one position of tactical and strategic value, which it would be specially advantageous for the United States to possess now—this is Saboga anchorage in the Pearl Islands, with those islands surrounding it.

Respectfully submitted.

W. V. PRATT,
Captain, United States Navy.

Approved.

I simply give that as an instance to show that we were not asleep as to what might happen.

I next submit a plan for outline of the policy for cooperating with the Emergency Fleet Corporation along the lines suggested by Gen. George Goethals. This is dated June 7, 1917. It is as follows:

PLAN No. 24.

MISSION—OUTLINE OF THE POLICY FOR COOPERATING WITH THE EMERGENCY FLEET CORPORATION ALONG THE LINES SUGGESTED BY GEN. G. W. GOETHALS.

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, June 7, 1917.

From: Capt. W. V. Pratt, United States Navy.

To: Chief of Naval Operations.

Subject: Cooperation of the Navy with the Emergency Fleet Corporation in the matter of propositions submitted by Gen. G. W. Goethals, general manager of the Emergency Fleet Corporation.

Reference: (a) Letter of May 28, 1917, from United States Shipping Board to Secretary of the Navy.

1. The importance and seriousness of this subject, together with the necessity of arriving first of all at a correct naval policy which shall coordinate its efforts with the efforts of those engaged in supplying the tremendous wastage in cargo tonnage caused by the submarine campaign, leads me to submit this letter. Were all views thoroughly in accord there could be no discussion. There is, however, a decided difference of opinions in the matter of the naval policy to be pursued. This letter is not in accord with the general view of the office; but it is submitted as one view of what the policy should be.

2. Owing to the present emergency, the Navy Department recognizes the building of cargo vessels is a measure of importance commensurate with the building of warships itself. Since in the department's opinion the building of a wooden fleet is not an adequate or a permanent way of meeting the situation, which must be met by steel construction, the Navy Department is glad to cooperate with the Emergency Fleet Corporation in every way possible, in enabling it to put its building program into operation.

3. A statement of the department's policy as regards the order of importance of war ships to be laid down is as follows:

- | | |
|----------------------------------|------------------------|
| (1) Submarine chasers. | (8) Submarine tenders. |
| (2) Destroyers. | (9) Hospital ships. |
| (3) Scout cruisers. | (10) Ammunition ships. |
| (4) Submarines, large and small. | (11) Repair ships. |
| (5) Battleships. | (12) Transports. |
| (6) Fuel ships. | (13) Gunboats. |
| (7) Destroyer tenders. | (14) Battle cruisers. |

4. The first five types, with the exception of (3) scout cruisers (of which only a limited number to serve as destroyer flotilla leaders should be laid down), are types of ships which are needed at present and the naval needs are such that all vessels of these types authorized should be begun at once.

5. Of equal importance to the above ships come the heavy merchant cargo carriers contemplated by the Emergency Fleet Corporation.

6. Naval ships coming under heads (6) to (12), inclusive, could, if necessity arose, be supplied out of the very types of ships to be built by the Emergency Fleet Corporation.

7. It therefore becomes evident that any cooperation of the Navy with the Emergency Fleet Corporation must be along lines represented by classes (3) and (14).

8. It is therefore believed that the first proposition submitted by Gen. Goethals is sound and that the Navy Department should cooperate to this extent. No new ships for the Navy of classes (6) to (12) inclusive, will be laid down on ways outside of Navy Yard ways without an adjustment first with the Emergency Fleet Corporation, so long as the present emergency exists. If, however, due to this policy the shortages in such types of naval auxiliaries severely handicap the Navy, it is agreed that the Emergency Fleet Corporation will meet this need out of its own vessels building.

9. It is also believed that the second proposition is sound, and that the Navy Department should cooperate to the extent of relieving any or all of the four building ways (not in a navy yard on the Atlantic coast) now under construction for the battle cruisers, in order that said ways may be used by the Emergency Fleet Corporation. This arrangement to hold good during the present emergency, or unless a new military necessity demands a new arrangement.

10. It is not the department's policy to allow cargo-carrying merchant ships to be laid down on any ways in the existing navy yards. Such construction cramps the

yard facilities and handicaps the purpose for which these yards were originally established, viz, the repairs of naval ships already in service. But in view of the present emergency, it is believed that any battle cruisers' ways, laid down in a navy yard on the Pacific coast, could be temporarily loaned to the Emergency Fleet Corporation.

11. The above views are held because it is believed:

(a) A successful termination of this war will preclude the chance of another for some term of years.

(b) For the allied purposes, merchant ships are as essential to the successful termination of this war as battleships, and that their construction is even more important at present.

(c) The counter for the United States, in case of an unsuccessful termination of this war lies in: (1) In our naval submarine; (2) in conscription.

(d) Of new future possible opponents other than the present opponents: (1) The chances are remote, owing to present alliances; (2) We are already stronger than any other probable opponents; (3) It would be better to buy our battle cruisers from our present allies (in case they were needed) than to lay them down now in the present emergency, an emergency which must be met now.

(e) In case this war terminates successfully, the merchant ships laid down by us will be the most useful types in existence in furthering the ultimate good of the country.

12. Finally, we did not enter this war alone. We have allies, and their efforts against the now common enemy, have stood between us and possible aggressions for over two years. They have needs. Their needs are immediate and imperative. Their cause is our cause now. The decision to the estimate of the situation as made in this office was as follows:

IMMEDIATE MISSION.

To render the maximum possible support now to the enemies of the Central Powers. And a second important but future mission was:

Develop the full military and naval strength of the United States as far as possible.

In a paper of April 5, 1917, the general board writing on the subject "Assistance that United States can give Allies upon declaration of War" makes several pertinent suggestions of which one is as follows: "Keep constantly in view the possibility of the United States being in the not distant future compelled to conduct a war single-handed against some of the present belligerents and steadily increase the strength of the fighting line," etc., etc.

That remark is pertinent and sound, but it does not mean that one fraction of the strength of the effort we should put into the successful accomplishment of the immediate mission should be sacrificed to any possible future contingency. Moreover, the day that the conscription law passed, and universal training was assured to the people of our country, its future security was guaranteed in a manner past every future building program the Navy might attempt.

13. A hasty review of the international situation leads me to the conclusions that England's fleet will never be allowed to pass into German hands, nor can it be quiescent while Germany works her will on any of the present Allies. It is the death of England to allow it. If at the end of this war strained relations should arise with England (a proposition which seems to be untenable) no amount of feverish building of dreadnoughts or battle cruisers could hope to put us in a position to cope with her fleet on the high seas. In such a contingency our efforts should now be directed toward augmenting our submarine fleet, in both the offensive and information types.

14. It must have been noted that upon our entry into this war, a certain tension existing between this country and Japan was immediately relaxed. They immediately in certain press articles suggested a close cooperation with the United States. This close cooperation now with Japan is to my mind the key to the solution of what might have been a future problem.

15. Therefore, if we concentrate our present naval building efforts to:

- (1) A standard type of destroyer to meet present needs;
- (2) Submarines, large and small, to meet future needs.
- (3) Battleships laid down and now on the ways.
- (4) Certain types of small craft, such as tugs and sweepers.

(5) Cooperate with the Shipping Board to produce cargo carriers, we will have put forth the Navy's best efforts, not for the Navy alone, but for the country, and especially for the Allies, whose war is now our own.

16. For the above reasons I am obliged to differ with the consensus of opinion expressed in the Office of Operations, and implied in the general board's recommendations, and do concur in the opinion and propositions expressed in Gen. Goethals' letter of May 28, 1917, with the modification set forth in paragraphs 8, 9, and 10.

W. V. PRATT.

Number 25 is a plan to inaugurate a naval building program which will best meet our immediate needs and which will not be inharmonious with any future policy we may be called upon to adopt. This was probably about the 1st of June. This plan is as follows:

PLAN No. 25.

MISSION—INAUGURATE A NAVAL BUILDING PROGRAM WHICH WILL BEST MEET OUR IMMEDIATE NEEDS AND WHICH WILL NOT BE INHARMONIOUS WITH ANY FUTURE POLICY WE MAY BE CALLED UPON TO ADOPT.

NAVY DEPARTMENT,
OFFICE OF NAVAL AERONAUTICS,
Washington.

Following estimates of the situation submitted by Commander Schofield, Commander Lanning, and other officers, the following decisions are reached:

NOW.

- (1) That the immediate need is to speed up the naval building program.
- (2) In building now, to lay special stress on those particular types which are needed now.
- (3) That the destroyer, with its accompanying flotilla tender, is the type which is needed now.
- (4) To lay down as many of these craft, at once as the various yards can accommodate, with the idea of bringing the grand total of destroyers to a number which shall be in the ratio of 4 to 1 with the battleships and battle cruisers, or a grand total of 232. Number to be laid down now, 124.
- (5) To lay down immediately a flotilla of small fast patrol craft for the use of the Atlantic coast defenses. The basis of the policy in determining the numbers of these craft, to be as follows:
 - (a) They are bought or constructed because of the immediate need only and not for future needs;
 - (b) that for future needs the present type of 110 foot craft may radically change;
 - (c) that sufficient numbers to provide for the defense of the four principal Atlantic seaports and to patrol certain probable submarine basing localities be provided;
 - (d) that to meet the immediate need it is unnecessary to estimate for the Pacific coast;
 - (e) that the minimum of such craft, rather than the maximum, should be the basis of estimate;
 - (f) that 250 such craft represent the minimum and that 500 should be an ample margin.

NOTE TO 4.—At the beginning of the war England had 245 destroyers. This did not begin to be enough, and she is supposed to have laid down many more. Germany was credited with 167. We are credited with 52 built and 108 total authorized.

- (6) Push to completion our major naval craft now on the ways and over 50 per cent completed.

- (7) That the next immediate need is an aircraft building program sufficient to provide for the adequate patrol of the entire Atlantic and Gulf coast defense districts.

NOTE.—Sir Douglas Haig is credited with saying that one trained pilot and machine, on the western front, was worth 2,000 men. The air patrol and bombing work of the heavier-than-air machines, in conjunction with the observation work of the lighter-than-air machines, both working in cooperation with the fast, small patrol craft, should be a good defensive measure against submarines, freeing the strictly naval craft from the many defensive demands that will certainly be made upon them. This would leave the purely naval types free to cooperate in the very best manner the demands of an allied campaign might make.

IMMEDIATE FUTURE.

- (8) That the type which may be most urgently needed immediately following the present situation is the sea-keeping submarine.

- (9) To lay down as many of these sea-keeping submarines as possible with the idea of bringing the total of submarine class to 200, or on a par with our possible transatlantic opponent.

NOTE.—At the beginning of the war Germany was credited with 65. Various estimates put her submarines of different classes between 200 and 300 now.

(10) That the approximate number of sea-keeping submarines we should lay down to provide for the immediate future following this war is approximately 150.

(11) That of the 150, approximate, submarines needed to bring our total to 300 the ratio of one-third for scouting and two-thirds for strictly offensive deep-sea work should be observed.

FUTURE NEEDS.

(12) That the future naval need may be to build major ships of the dreadnought and battle-cruiser type; and to provide suitable fleet accompanying aircraft.

(13) That in planning for our needs in battleships and in battle-cruisers, we should adopt some building policy.

(14) That the policy to adopt is as follows:

To build major ships, in numbers, so that the United States will have, as least—

(a) Naval equality, with a margin of safety, on our Atlantic frontier, to our most probable opponent.

(b) Marked naval superiority on our Pacific frontier—when the high-sea fleet is mobilized in those waters.

NOTE.—At the beginning of the war, Germany had 20 dreadnoughts, 6 battle cruisers, 26 scouts. Our present program calls for 29AA, 6BB, 10S. Unless Germany has increased her tonnage in major ships, during the war, our program would leave us short only in BB, and scouts. If the scouts of the future are the submarine and aircraft we could afford to be short in surface scout types, provided we were ahead in submarines, aircraft, and battle cruisers.

(15) That the minor naval craft, such as aircraft, destroyers, submarines, forming the fleet, should be proportioned so that the fleet will be properly balanced.

(16) That the probable scouting agents of the future may very likely be the submarine and the aircraft.

(17) That the final future needs of the mobile fleet lie in adequate numbers of supply ships, hospital ships, fuel ships, mine layers, tugs, and parent ships to properly balance the fleet.

(18) That the fleet building program should be considered separately from the coast defense building or purchase program in order that undue emphasis should not be laid on the question, defense.

(19) That as far as is practicable, in view of the immediate situation, the fleet building program should be given the right of way over the purely coast defense program.

(20) That no fleet building program is well balanced or adequate which does not at the same time consider the necessity of enlarging the capacity of the necessary repair reserve and supply bases at home, and which does not contemplate the acquisition and proper fitting out of the necessary fleet and coast operation bases.

What I had marked as No. 26 has already been submitted in my plan of policy as the plan of the board on submarine detection. Its date is July 6, 1917.

Twenty-seven is policy for priorities of personnel. Its date is November 1, 1917. That is the plan that Admiral Palmer spoke of, when we switched and gave him a definite plan that he could operate under for his training purposes. It is as follows:

PLAN No. 27.

POLICY FOR PRIORITIES OF PERSONNEL.

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, November 1, 1917.

From: Chief of Naval Operations.

To: Bureau of Navigation and C in C.

Subject: Policy of operations re the readjustment of complements.

Reference: (a) Bureau of Navigation confidential letters Nos. N1, CMB, 1, MH, October 10, 1917; (b) C in C's letter of October 24, 1917.

1. Forwarded.

2. While the ultimate mission of every force which forms an integral part of the fleet is to fit itself to play its part most efficiently in battle, to expeditiously accomplish this ultimate mission for the good of the whole may require the assignment of

immediate missions to parts of the organization, which missions must depend both on the immediate operation of war to be performed and the ultimate goal to be achieved.

3 The ultimate and immediate mission of the vessels of battleship force 2 shall be: maintain themselves in instant readiness for battle.

4 The ultimate mission of battleship force 1 is to fit itself for battle. To that end it shall maintain a permanent nucleus battle organization of both officers and men efficient to keep the material in constant readiness for battle and permit rapid preparation for battle when battle complement is assigned.

The immediate mission of battleship force 1 is to train officers and men for service in other vessels.

5 The immediate mission of vessels of the cruiser force is to guard convoys.

6 The immediate mission of the destroyer force is to operate against the enemy.

7 The immediate mission of the submarine force is twofold, (a) to operate against the enemy, (b) to train personnel for service in new vessels that may operate against the enemy. Ships not engaged in operating against the enemy should be engaged in training personnel.

8 The immediate mission of the train is the service of logistics, (a) for our military and naval forces at the fighting front, (b) for our fleet at home, (c) in any allied service abroad, (d) general service at home.

9 In all forces, when not incompatible with the immediate mission, additional personnel should be carried for training.

W. V. PRATT, Acting.

DEAR ADMIRAL: While I am morally sure this is in accord absolutely with your policy, I want to be sure. So, while it was signed and sent to Navigation, I told them to hold it up pending your O. K. in the matter. Therefore, I am sending this to you, and if you agree cable me to that effect, please. We are in reality working along these lines, and it seems to be a necessity, but as yet while all agreements are verbal, I really want a policy on paper. Will you then cable, please?

PRATT.

Twenty-eight is the mobilization sheet of November 3, 1917, which is the end of the critical six months, or about the end of the critical six months spoken of, showing the position at that time, the duty, the location, and the assignment of our naval forces.

The CHAIRMAN. Of all of our naval forces?

Capt. PRATT. Yes, I think so. It is the mobilization sheet, and it should be.

The CHAIRMAN. Including all the ships we had taken over outside of the Navy?

Capt. PRATT. All that would be in commission at that time. No, there might be others taken over that might not appear in here.

The CHAIRMAN. But if they were in commission they would be here?

Capt. PRATT. They would be there; and the list taken over is in the 'naval districts' list. This sheet is as follows:

PLAN NO. 28.

Mobilization sheet Nov. 3, 1917.

ly against them. The department being best in touch with all information concerning enemy movements will for the present designate the areas to be occupied by available submarines.

There will be certain special submarine patrols which will be directly administered from the Office of Naval Operations; naval districts concerned will be given information concerning them which is needed in their own operations. Operation orders for ordinary submarine patrols will as heretofore be issued by the naval districts in which the submarines are based. Since all districts whose offshore waters need submarine patrols are not manned by submarine divisions, and because contiguous patrol areas sometimes lap into two districts, it is essential that neighboring districts be informed of a prospective patrol in order that it may issue instructions to prevent danger to our submarines and joint interference between their operations and those of the district surface and aircraft.

Aircraft, surface hunting units and other surface patrol or scouting craft must not be sent on antisubmarine missions into areas known to be occupied by our own submarines; to do so would unnecessarily endanger our own submarines and the efforts of the air and surface craft might be nullified in hunting them. The naval district which issues the operating order to a submarine going on patrol will inform the commander in chief and commander cruiser force, Atlantic Fleet, the naval districts which include the area and also the districts next them, of the movement, including duration; this information should be sent out as early as possible. These instructions are not to be understood as interfering with dispositions for rescue or escorting air or surface craft—but the craft concerned in such a movement should be informed that our submarines are in the areas likely to be traversed. Hunting units are to be instructed to assume submarine patrol areas occupied unless informed to the contrary.

4. Ordinary submarine patrols will normally be one week, beginning and ending Saturday. On Wednesday of each week, naval districts in which submarines are based will inform Office of Operations—or may direct the submarine organization of the district to do so—of the submarines which on the following Saturday will be available for patrol. If there is no reason for maintaining a patrol at the particular time, none will be directed and the available boats will exercise, but remain ready for patrol. Otherwise, directions will be given to occupy certain areas. It then devolves upon the districts concerned to prepare operation orders, arrange convoy in and out and inform other districts.

PATROL OPERATION ORDERS.

5. Under ordinary circumstances, submarines will not need to be convoyed during darkness and convoy effort may be saved by having them leave for patrol in the afternoon and return early in the morning; this shortens the run of the convoying vessel and reduces the danger of our submarines encountering each other. These advantages offset anything that is gained by having them actually relieve on station. Since, however, late arrivals may happen, it is advisable to lay down outbound and inbound submarine routes for the different ports in which submarines are based, and direct which routes to follow.

Patrol operating orders are to include information concerning the convoy and west-bound routes that pass over the patrol area that will be in effect for the period of the patrol; this is in order that they may protect those routes in good weather and avoid them by night and in thick weather. When known, the probable sailing dates of convoys that concern them will also be given submarines going on patrol.

A submarine is not to enter any submarine area other than those to which it is assigned to patrol, unless said submarine knows such area to be unoccupied by submarines or hunting units. Such information as is necessary for this safeguard is to be supplied in patrol operation orders.

Patrol-operation orders should give schedules and wave lengths upon which information is likely to be broadcasted. When their important operations are not thereby nullified, they should listen on such schedules; since they can not always get a message, those containing important information or direction should be repeated on one or more subsequent schedules.

SURFACE HUNTING GROUPS.

6. The commandants of naval districts will formulate plans for using their submarine-chaser hunting groups and air forces to protect areas near the coast not occupied by submarine patrols.

In working out the details of these plans, it is advisable that submarine-chaser hunting groups be based as near as practicable to the areas in which they are expected to operate.

1352

NAVAL INVESTIGATION.

Mobilization sheet, Nov. 5,

bureaus and a representative from the general board. Every Tuesday morning an executive session was held. At the conference the Assistant Chief of Naval Operations presided and all officers of the grade of captain and admiral who might be on temporary duty in the office, for the purpose of getting in touch with the war situation preparatory to assignment to duty at the front, were invited to attend. The situation of the past week was rehearsed. All formulated plans ready were passed upon, signed, and made ready for final approval by the Secretary. All new plans were assigned to certain members of the committee, chosen by the chairman, and these members were instructed to report their finished plans by a certain date. This method worked very satisfactorily, except as noted in the failure to have the basic deliberative body, which at that time was not possible, as there were not the officers available. Every chief of division had to constitute himself the deliberative head for all work coming under his cognizance.

The CHAIRMAN. When was that plan submitted?

Capt. PRATT. This is not a plan. When did we first start this?

The CHAIRMAN. When did you commence doing this?

Capt. PRATT. We commenced as soon after June 25 as I possibly could.

The CHAIRMAN. June 25, 1917?

Capt. PRATT. 1917. That is the way I operated.

Now, I would like to discuss for a moment some of the plans which actually were in use in the war zone, which are not plans of preparation but are distinctly war plans of operation, one of those being the relations of armed guards and convoys. There has been a certain inference, I think, drawn that convoy and armed guard ran counter to each other. On the contrary, they did not run counter at all, and that very detailed plan of armed guard which we had in operation before the war flowed naturally and automatically into convoy operations, and really was conducive to a greater degree of efficiency than any system which the British had evolved up to the time we entered the war, or any time after we entered the war to its close. The points where convoy run counter are not to armed guard but to the system of patrol, which was in vogue in the British Navy when we entered the war, and according to the testimony of one of the destroyer captains whom I have talked to, existed for a period, he would say, of at least 6 weeks after our destroyers got across to the other side; so that not trying to find any fault with Admiral Sims's statements at all, I merely wish to explain the situation a trifle, and to show, as I think, that he had a rather mistaken idea of our convoy in relation to armed guard and convoy, and particularly where he cites that cable in which he states that he was ready to "jump overboard."

There was no statement made in that cable (I drew that part of it up myself); I drew the whole cable up myself, I think, and I know the purpose of my own mind. It was that there should be no misunderstanding of the value of armed guards, both within the convoy and without the convoy, because the convoy system as it was inaugurated, as it went into effect at the beginning of the war, and as it continued throughout the war, to the signing of the armistice, was never a whole and completely and thoroughly rounded project, because it was not possible for them to convoy ships in and out. There were not sufficient vessels to do it. Therefore convoy, while it protected the cargo

100 per cent during its existence, into the ports throughout the barred zone or through the war zone, did not protect the ship on its way out because that ship had to go alone. While it protected the cargo 100 per cent, it protected the tonnage about 50 per cent. But the arming of our ships and placing on board those ships a trained personnel was as far as it was humanly possible, the most adequate protection which we could give that ship. A ship was all the better for going into convoy with an armed guard on board, far better than she was without it. The system of patrol which had been inaugurated on the other side was one of dividing the dangerous area into squares. Our destroyers were assigned duties in the squares. They picked up an incoming ship, carried it through to the next square, and it was carried through to the next and so on until it reached port. That was not an effective system. But there was really quite as much discussion on the other side—more, in fact, I imagine—as there was on our own, as to whether they should give up a system which they themselves had evolved and go to convoy, or whether they should change in the middle of the war and adopt convoy.

It was for those very reasons, and for the fact that it was considered a very doubtful procedure as to whether untrained merchant captains in conditions of fog and bad weather, in winter or summer, could handle their ships with the precision necessary, the same precision with which you have to handle a naval vessel, and whether there would not be more sinkings, due to actual collisions, than there were due to submarines, that caused us on this side to weight the question—not to refuse it, but to weigh it—and it was ultimately decided upon——

The CHAIRMAN. For the information of the committee, will you explain how the convoy would protect the cargo 100 per cent and the tonnage 50 per cent?

Capt. PRATT. Yes; because the loaded ships were assembled, say at our ports. There were various convoy systems, some coming up from South Africa, some along the coast of Spain and France to British ports, and let us say from our own ports, the convoy was assembled off Halifax. It proceeded under the guard of a cruiser, and it was met outside of the dangerous area by destroyers, which escorted it into port. The vessels were discharged and they then proceeded on their own responsibility back to ports of loading.

The CHAIRMAN. With no convoy going back at all?

Capt. PRATT. No, sir; they wanted to do it, and toward the end of the war we discussed the problem, and not doubting its advisability at all, we wanted to do it if we could. There was also this further objection to convoy, which made it a matter of discussion, and that was a very important point. It was almost sure to, and it did slow up the transport of foodstuffs into allied countries. The actual amount that it slowed up was over 20 per cent—between 20 and 25 per cent.

The CHAIRMAN. That is, the time was taken to gather the ships up?

Capt. PRATT. To gather them up; and there was also one other serious feature, too, that caused numerous cablegrams to pass between Admiral Sims and us, and that was particularly the putting of fast ships into the convoy. We were running at that time the only trans-Atlantic line which could carry mails and passengers across, in our ships of the International Mercantile Marine, the New York and

the St. Louis, fast 18-knot ships. They did not have the bunker capacity to go into Halifax and to go across, and in talking the matter over with Mr. Franklin, he said that he would far rather that these ships should run through without any protection at all; so that when the discussion came up as to whether those should go—and that was one of the main points of contest—we thought it was safer to let those vessels go on their own responsibility, rather than to put them into a slow merchant convoy of from 11 to 8 knots. What I wish to state is that it was not a refusal on that point, because as you will note, he states that the first convoy came through about May 31, I think; and even while we were discussing the details, the discussion being then—I will read it to you later—as to whether it would not be wiser to form a convoy this way, to let all the ships sail as fast as they could out of our own ports, and let them collect, say at any point that the Admiralty might desire, outside of the war zone, on certain days, there to herd together, and after having collected in as fast as they could, from that point to be convoyed in; and that was one of the points of discussion which was being held at that time—one of our ideas.

But even while we were discussing that point, Admiral Jellicoe finally said, in his cable of about July 4 or 5, they wanted it done. We stopped immediately and acceded to it, because the British had finally said they wanted it, and whether we did not think it best, it was their plan and their ships were involved more than ours, and we yielded at once. But the point was, the point I wish to make is, that while it took Great Britain a number of years to find out that they really wanted convoy, we with discussion only between May 31 when it became an assured success and July 5 when we had practically accepted it in toto, and that appears to me to be rather a natural thing to do. But I wanted to clear up the point that there is no opposition between armed guard and convoy. The counter arguments between patrol and convoy.

The CHAIRMAN. There would be an opposition between the two ideas if the armed guard were used exclusively to take the place of convoy, would there not?

Capt. PRATT. Oh, yes. We would then have to accept our own risks, as we did in the case of the American line ships. If we refuse to accept convoy, we accept the risks. It does not interfere with convoy at all. That was simply because, in this case, of the belief that the risk for the ship is greater in convoy than running alone. She then has to go on her own, and when she gets outside of the port she signals and gets routing instructions in; and that does not interfere with the convoy, because of keeping her out; unless we demand protection for her. Then it would. I have submitted a number of papers which further elaborate and go into comparisons between the two.

The CHAIRMAN. Are they papers that were submitted to the department during the war?

Capt. PRATT. No; it was done after the war. It was done the other day, to clarify the situation. It is more the summary of what has happened.

The CHAIRMAN. That is in regard to the convoy system?

Capt. PRATT. Yes; and what I will read will be to show some of the evidence of the figures we got from having such a system worked

In view of the lack of special equipment and special training of some chasers assigned to naval districts, and the necessity of using these vessels in places for escort work, etc., it is not considered practicable at present for districts to efficiently patrol all those areas adjacent to the coast, with the chasers available for that purpose.

The department has therefore organized three special hunting squadrons, each with three chasers. Each squadron is composed of a certain number of submarine hunting groups and a vessel of the cruiser or destroyer type, with sufficient force to back up the operations of the submarine chasers and maintain the contact with the surface.

The operations of these special hunting squadrons will be under the control of the department, and they will be sent to infested areas to cooperate with the district craft. The operations of these squadrons will be restricted to areas assigned by submarine patrols, as follows:

The first squadron to operate on the Atlantic coast to the northward of latitude 30 north; the second squadron to operate on the Atlantic coast between the latitude 30 north and 40 north; the third squadron to operate in waters to the southward of latitude 30 north.

W. S. B

Copy to commander Submarine Division 8, secret file room, Capt. T. U. S. Navy, Capt. Hart, U. S. Navy, Commander Woodson, U. S. Navy.

There was a comment made by Admiral Fiske in which he admitted the plan under which the Office of Operations was to be organized, and he rather inferred that we had no plan up to the time he submitted those papers, which, as a practical war measure, had no real value at all. He does not know anything about it. We are doing the work, and we know what we are talking about.

Now, in order to get a real operating plans section that you have got to have something besides men that sit down and write paper things for somebody else to do. A real operating plans section has not only got to have the ability to draw up original conceptions, but it must have men on that committee who have the power to execute the things that they have drawn up. No other plans section in war will operate and really get things done except a plans section of that sort. So that very early in the morning after I came in as Aid for Operations, seeing that that did not exist, during the summer and fall of 1917, the following method of handling plans was evolved. I want to set at rest any doubt that may have arisen as to whether we had plans, as far as being able to cope with the questions that came up.

The CHAIRMAN. For operations?

Capt. PRATT. For operations; yes, sir. Owing to the shortage of specially trained officers and of the need of all regular officers in the Navy, it was not possible to form a plans section entirely divorced from administrative duties, although its desirability is not questioned. Such a deliberative body is of inestimable value in presenting data and first plans to the executive body. The crying need of the time was for an executive plans section which not only combined the deliberative and executive functions but the more practical features of the administrative system, so that we not only got the plan but the backing of the various bureaus to put it through. With this formulated plan ready for action it was then in shape to get the approval of the Chief of Operations and of the Secretary. Therefore an executive plans section was formed in Operations, consisting of the heads of the various divisions of the office and including representatives from each

the St. Louis, fast 18-knot ships. They did not have the bunker capacity to go into Halifax and to go across, and in talking the matter over with Mr. Franklin, he said that he would far rather that these ships should run through without any protection at all; so that when the discussion came up as to whether those should go—and that was one of the main points of contest—we thought it was safer to let those vessels go on their own responsibility, rather than to put them into a slow merchant convoy of from 11 to 8 knots. What I wish to state is that it was not a refusal on that point, because, as you will note, he states that the first convoy came through about May 31, I think; and even while we were discussing the details, the discussion being then—I will read it to you later—as to whether it would not be wiser to form a convoy this way, to let all the ships sail as fast as they could out of our own ports, and let them collect, say at any point that the Admiralty might desire, outside of the war zone, on certain days, there to herd together, and after having hooked in as fast as they could, from that point to be convoyed in; and that was one of the points of discussion which was being held at that time—one of our ideas.

But even while we were discussing that point, Admiral Jellicoe actually said, in his cable of about July 4 or 5, they wanted it done. We stopped immediately and acceded to it, because the British had finally said they wanted it, and whether we did not think it best, it was their plan and their ships were involved more than ours, and we yielded at once. But the point was, the point I wish to make is, that while it took Great Britain a number of years to find out that they really wanted convoy, we with discussion only between May 31 when it became an assured success and July 5 when we had practically accepted it in toto, and that appears to me to be rather a natural thing to do. But I wanted to clear up the point that there was no opposition between armed guard and convoy. The counter arguments between patrol and convoy.

The CHAIRMAN. There would be an opposition between the two, at least if the armed guard were used exclusively to take the place of convoy, would there not?

Capt. PRATT. Oh, yes. We would then have to accept our own risks, as we did in the case of the American line ships. If we refuse to accept convoy, we accept the risks. It does not interfere with convoy at all. That was simply because, in this case, of the belief that the risk for the ship is greater in convoy than running alone. She then has to go on her own, and when she gets outside of the port she signals and gets routing instructions in; and that does not interfere with the convoy, because of keeping her out; unless we demand protection for her. Then it would. I have submitted a number of papers which further elaborate and go into comparisons between the two.

The CHAIRMAN. Are they papers that were submitted to the department during the war?

Capt. PRATT. No; it was done after the war. It was done the other day, to clarify the situation. It is more the summary of what has happened.

The CHAIRMAN. That is in regard to the convoy system?

Capt. PRATT. Yes; and what I will read will be to show some of the evidence of the figures we got from having such a system worked

100 per cent during its existence, into the ports throughout the barred zone or through the war zone, did not protect the ship on its way out, because that ship had to go alone. While it protected the cargo 100 per cent, it protected the tonnage about 50 per cent. But the arming of our ships and placing on board those ships a trained personnel was, as far as it was humanly possible, the most adequate protection which we could give that ship. A ship was all the better for going into convoy with an armed guard on board, far better than she was without it. The system of patrol which had been inaugurated on the other side was one of dividing the dangerous area into squares. Our destroyers were assigned duties in the squares. They picked up an incoming ship, carried it through to the next square, and it was carried through to the next and so on until it reached port. That was not an effective system. But there was really quite as much discussion on the other side—more, in fact, I imagine—as there was on our own, as to whether they should give up a system which they themselves had evolved, and go to convoy, or whether they should change in the middle of the war and adopt convoy.

It was for those very reasons, and for the fact that it was considered a very doubtful procedure as to whether untrained merchant captains in conditions of fog and bad weather, in winter or summer, could handle their ships with the precision necessary, the same precision with which you have to handle a naval vessel, and whether there would not be more sinkings, due to actual collisions, than there were due to submarines, that caused us on this side to weight the question—not to refuse it, but to weigh it—and it was ultimately decided upon——

The CHAIRMAN. For the information of the committee, will you explain how the convoy would protect the cargo 100 per cent and the tonnage 50 per cent?

Capt. PRATT. Yes; because the loaded ships were assembled, say at our ports. There were various convoy systems, some coming up from South Africa, some along the coast of Spain and France to British ports, and let us say from our own ports, the convoy was assembled off Halifax. It proceeded under the guard of a cruiser, and it was met outside of the dangerous area by destroyers, which escorted it into port. The vessels were discharged and they then proceeded on their own responsibility back to ports of loading.

The CHAIRMAN. With no convoy going back at all?

Capt. PRATT. No, sir; they wanted to do it, and toward the end of the war we discussed the problem, and not doubting its advisability at all, we wanted to do it if we could. There was also this further objection to convoy, which made it a matter of discussion, and that was a very important point. It was almost sure to, and it did slow up the transport of foodstuffs into allied countries. The actual amount that it slowed up was over 20 per cent—between 20 and 25 per cent.

The CHAIRMAN. That is, the time was taken to gather the ships up?

Capt. PRATT. To gather them up; and there was also one other serious feature, too, that caused numerous cablegrams to pass between Admiral Sims and us, and that was particularly the putting of fast ships into the convoy. We were running at that time the only trans-Atlantic line which could carry mails and passengers across, in our ships of the International Mercantile Marine, the New York and

the St. Louis, fast 18-knot ships. They did not have the bunker capacity to go into Halifax and to go across, and in talking the matter over with Mr. Franklin, he said that he would far rather that these ships should run through without any protection at all; so that when the discussion came up as to whether those should go—and that was one of the main points of contest—we thought it far safer to let those vessels go on their own responsibility, rather than to put them into a slow merchant convoy of from 11 to 8 knots. What I wish to state is that it was not a refusal on that point, because as you will note, he states that the first convoy came through about May 31, I think; and even while we were discussing the details, one discussion being then—I will read it to you later—as to whether it would not be wiser to form a convoy this way, to let all the ships sail as fast as they could out of our own ports, and let them collect, say at any point that the Admiralty might desire, outside of the war zone, on certain days, there to herd together, and after having flocked in as fast as they could, from that point to be convoyed in; and that was one of the points of discussion which was being held at that time—one of our ideas.

But even while we were discussing that point, Admiral Jellicoe finally said, in his cable of about July 4 or 5, they wanted it done. We stopped immediately and acceded to it, because the British had finally said they wanted it, and whether we did not think it best, it was their plan and their ships were involved more than ours, and we yielded at once. But the point was, the point I wish to make is, that while it took Great Britain a number of years to find out that they really wanted convoy, we with discussion only between May 31 when it became an assured success and July 5 when we had practically accepted it in toto, and that appears to me to be rather a natural thing to do. But I wanted to clear up the point that there is no opposition between armed guard and convoy. The counter runs between patrol and convoy.

The CHAIRMAN. There would be an opposition between the two ideas if the armed guard were used exclusively to take the place of convoy, would there not?

Capt. PRATT. Oh, yes. We would then have to accept our own risks, as we did in the case of the American line ships. If we refuse to accept convoy, we accept the risks. It does not interfere with convoy at all. That was simply because, in this case, of the belief that the risk for the ship is greater in convoy than running alone. She then has to go on her own, and when she gets outside of the port she signals and gets routing instructions in; and that does not interfere with the convoy, because of keeping her out; unless we demand protection for her. Then it would. I have submitted a number of papers which further elaborate and go into comparisons between the two.

The CHAIRMAN. Are they papers that were submitted to the department during the war?

Capt. PRATT. No; it was done after the war. It was done the other day, to clarify the situation. It is more the summary of what has happened.

The CHAIRMAN. That is in regard to the convoy system?

Capt. PRATT. Yes; and what I will read will be to show some of the evidence of the figures we got from having such a system worked

from the date we went into the war. It was of inestimable value to us. It may not have been to the British, because their system was different from ours. They only put two gunners on a ship while we put a full gun's crew. During the period during which we were at war, 384 merchant ships were armed and 1,832 trans-Atlantic trips were made by these ships.

Three hundred and forty-seven attacks by enemy submarines were reported.

The CHAIRMAN. Were these altogether American ships?

Capt. PRATT. American ships.

Two hundred and twenty-seven attacks by enemy submarines were classified as "actual."

Twenty-nine ships were sunk under classification "torpedoed."

Two ships were sunk by shell fire, one of which, a tanker, caught fire after a running fight of 2 hours' duration. The other was sunk only after all ammunition had been expended in a running fight of over 4 hours' duration.

One hundred and ninety-three attacks were successfully repulsed.

The CHAIRMAN. Will you read the names of those two ships?

Capt. PRATT. One was the *Morini*, I think.

The CHAIRMAN. Can you give the name of the other?

Capt. PRATT. I can get the names of those two ships. I will do so.

Thirty-four attacks resulted in probable damage to the enemy submarine.

Two million seven hundred and thirty-eight thousand and twenty-six tons of United States shipping were armed.

One hundred and sixty-six thousand four hundred and twenty-eight tons of United States armed shipping were sunk by enemy submarines.

As a result of attacks successfully repulsed, approximately 1,400,000 tons of United States shipping was saved.

In arming ships, of course the very first thing that is accomplished is to force the submarine to use the torpedo. Anyone who has seen that picture of the U-23 in which 21 vessels were sunk, and all except one were sunk with torpedoes, must realize what a tremendous saving to shipping these precautionary measures were of arming merchant ships. The point, as I said before that I wish to emphasize is that it assists convoys as soon as they adopt it, and is in nowise a measure against convoy.

This analysis and the accompanying memorandum I submit, as follows:

[Extract from Admiral Sims's article, December, 1919, *World's Work*.]

Our first division of destroyers reached Queenstown on Friday morning, May 4, 1917; the following Monday they put to sea on the business of hunting the submarine and protecting commerce. For the first month or six weeks they spent practically all their time on patrol duty in company with British destroyers, sloops, and other patrol vessels. Though the convoy system was formally adopted in the latter part of May, it was not operating completely and smoothly until August or September. Many troop and merchant convoys were formed in the intervening period and many were conducted through the submarine zone by American destroyers; but our ships spent much time sailing singly, hunting for such enemies as might betray their presence, or escorting individual cargoes. The early experiments had demonstrated the usefulness of the convoy system, yet a certain number of pessimists still refused to accept it as the best solution of the shipping problem; and to reorganize practically all the shipping of the world, scattered everywhere on the seven seas, necessarily took time.

ANALYSIS OF ARMED-GUARD PLAN IN RELATION TO CONVOY.

NAVY DEPARTMENT,
BUREAU OF NAVIGATION,
Washington, D. C., March 27, 1920.

1. Admiral Sims alleges that the Navy Department entered war unprepared, with no well considered policy or plans, and that the policy pursued was one of vacillation. Quite to the contrary there is presented herewith an estimate of the situation as prepared by the Navy Department on March 1, 1917. Considering the situation at that date, this is a clear-cut and well-defined estimate, which was almost immediately incorporated into a policy and put into effect. That this policy was not a vacillating one is borne out by the fact that it was fundamentally in existence and practice at the signing of the armistice (termination of hostilities). That the Navy Department acted promptly and effectively is shown by the sequence that on March 1 an estimate of the situation had been prepared; on March 13 this had been incorporated into a policy which embodied certain regulations for putting it into effect which policy and regulations were approved on that date by the President; on March 16 the promptness is still further shown by the sailing for the war zone of the first armed merchant ship; on April 19 the effectiveness is clearly shown when a hostile submarine was damaged by the first shot of the participation by the United States into the war—a 6-inch shell fired by the armed guard of the steamship *Mongolia*.

2. In referring to the records of the case at hand we find that the commander, United States naval forces operating in European waters arrived in England April 10, 1917. On April 19, he submits by letter to the Navy Department his estimate of the situation, N. B. It is reasonable to suppose that the Navy Department received this letter 10 days later.

3. Certain quotations are here made from the above letter relative to the subject in hand:

Paragraph 3. "The submarine campaign against merchant shipping of all nations has resolved itself into the real issue of the war and stated briefly the Governments have not been able to, and are not now, effectively meeting the situation present."

Paragraph 7. "The enemy really reckoned that the Allies would be defeated in two months through shortage of supplies."

Paragraph 14. "Considerable criticism has been, and still is, concentrated upon the admiralty for not taking more effective steps and for failing to produce more substantial and visible results. One of the principal demands is for convoys of merchant shipping, and more definite and real protection within the war zone."

Paragraph 15. "It is insistently asked (was asked by myself) why shipping is not directed to and concentrated at various rendezvous and from these convoyed through the dangerous areas. The answer is the same—the area is too large; the necessary vessels are not available."

Paragraph 17. "After trying various methods of controlling shipping, the admiralty now believes the best policy to be one of dispersion."

Paragraph 18. "The great difficulty in any method of shipping control is communication with the shipping itself and full cooperation by the merchant personnel. The moment a ship is captured the code either becomes dangerous or useless. The merchant code is being continually changed and at all times it can not be counted upon for more than a fortnight. The immense difficulty of changing the code and keeping shipping all over the world in touch with changes is apparent."

Paragraph 19. "Continual trouble is experienced with some merchant captains taking the law into their own hands and exhibiting contempt, or at least indifference, for admiralty instructions."

Paragraph 20. "The admiralty has had frequent conference with merchant masters and sought their advice. Their most unanimous demand is 'Give us a gun and let us look out for ourselves.' They are also insistent that it is impracticable for merchant vessels to proceed in formation, at least in any considerable numbers, due principally to difficulty in controlling their speed are to the inexperience of their subordinate officers. With this in view I do not personally agree, but believe that with a little experience merchant vessels could safely and sufficiently well steam in open formations."

Paragraph 21. "The best protection against the submarine menace for all classes of ships, merchant as well as naval, is speed and zigzagging."

Paragraph 22. "In the absence of adequate patrol craft, particularly destroyers, and until the enemy submarine morale is broken, there is but one sure method of meeting the submarine issue upon which there is also complete unanimity—increased number of merchant bottoms, preferably small:

"More ships! More ships! More ships! is heard on every hand."

Paragraph 32. "All are agreed that the best protection against torpedoes is speed and zigzagging."

4. It is particularly desirous to bring out at this point that statements and recommendations submitted by Admiral Sims are accepted in their good faith for the welfare of the Navy in accomplishing its mission throughout the war; it is only the fallacies thereof which lead him to his allegation and bring him to his conclusions that are being brought out.

From the above quotations taken from the letter of April 19, 1917, the following military points of this case are presented:

First, the real issue of the war is the submarine campaign against merchant shipping.

Second, the Allied Governments have not been able to and are not now meeting the situation.

Third, the enemy expect to win in two months through cutting off of supplies.

Fourth, there is a demand through criticism for convoy.

Fifth, objections to convoy manifest themselves through: (1) lack of necessary vessels (probably meaning escorting or station vessels); (2) lack of cooperation from the merchant personnel in that lose codes and do not carry out instructions.

Sixth, that the most unanimous demand from merchant masters is "Give us a gun and let us look out for ourselves."

Seventh, that the best protection against submarine menace and torpedoes is speed and zigzag.

Eighth, that the admiralty after trying various methods of controlling shipping believes the best policy to be one of dispersion.

5. That the department was not only meeting the situation as outlined by the above points, but was even putting into effect an even more effective policy is brought out by the following:

(a) Great Britain as the greatest maritime nation and with the largest interest at stake in the protection of her mercantile marine against the enemy's submarine policy, and after nearly three years of war experience upon which to base its policy had taken the following measures: (1) Establishes patrols in the close proximity of her coasts as a weapon or protection against the submarine and as a means to transmit routing instructions to merchant ships arriving at their stations; (2) routes the merchant vessels to avoid vicinity of recently known submarine activities. This form of routing often takes the form of closing ports for several days at a time, thus completely holding up all shipping in that vicinity; (3) provides a single gun located aft with a trained personnel of two or three men to man it; (4) provides an apparatus to the merchant ships for the purpose of making smoke screens; (5) issue certain instructions to merchant ships covering speed, zigzag, darkening ship, handling ship in the presence of the enemy, to avoid certain known practices of the enemy in attempts to entice a merchant ship in contact with mines or to a position for torpedoing it, etc.

(b) That neither France nor Italy have put forward any effective policies.

(c) On the other hand we find that the Navy Department has previous to entering the war laid down and put into effect a policy which not only embraced all that was covered by the British policy after three years' experience, but for the following reasons was the more effective: (1) That it provided at least two guns as a protection for each vessel; (2) that it provided a commissioned officer or experienced chief petty officer of the Navy in charge with two leading petty officers as assistants and a complete trained gun crew from the battleship force for each gun; (3) to maintain its efficiency a rigid system of inspection coupled with special training was put into effect. Upon the establishment of convoy, signal and radio personnel of the Navy was added; (4) that it supplied personnel sufficient for a lookout system; (5) that it provided a military force to see that all rules and regulations prescribed or recommended were carried out; (6) that it presented the entering wedge whereby it was possible for the Navy Department later to assume a more direct control of the mercantile shipping.

To bring out this latter point which is most important, the following should be considered: (1) That the Navy Department either in peace or in war has no direct control over the privately owned shipping of the United States; (2) that such control as is exercised by this Government comes under the jurisdiction of the Department of Commerce; (3) that in Great Britain the admiralty has the right to control her shipping in time of war; (4) that even with this power the admiralty, after three years' experience, was having trouble in exercising its functions; (5) that the Navy Department by its foresight did, in a comparatively short time, considering our system of Government, eliminate these conditions.

6. The ultimate effectiveness of the department's policy will be shown further on in detail.

Admiral Sims, as a result of this letter of April 19, 1917, draws certain conclusions in which he intimates that failure to adopt convoy system was largely responsible for great losses of tonnage and limited the number of troops which could be sent abroad during the first year.

The fallacies in this argument are:

1. Up to that time no specific recommendation for convoy had been made; in fact dispersion had been decided upon by the Admiralty.

2. The type of vessels being sunk were not suitable for transporting troops.

3. At that time all such ships as were suitable for troop transports were being rapidly converted and put into condition.

4. After the declaration of war the loss of tonnage to the United States shipping during April, 1917, was only 8,944 tons of which 2,551 tons represented an armed ship. This armed ship, the *Vacuum*, was torpedoed under conditions most favorable to the submarine in that the sea was rough, with whitecaps, making it difficult to see a periscope. Despite these conditions, however, the fact that the torpedo was sighted before it reached the ship was encouraging as it demonstrated the value of lookouts, and had weather conditions been more favorable, would doubtless have enabled the vessel to maneuver to avoid torpedo as happened in many instances later.

On April 30, 1917, it is to be noted that a cable from Admiral Sims to the department states that "Admiralty is making a study of convoy system for shipping," and "This advance information for department's consideration."

Again, on May 1: "Admiralty has decided to give trial to convoy scheme.

"I urgently recommend favorable action.

"Through British Naval representative at Washington details of plan will be communicated from time to time as necessary."

On May 25, he cables: "The principal of convoying merchant ships in accordance with general plans is approved by the Admiralty."

On May 31 a cable states that British convoy from Gibraltar arrived safely on May 20, 1917.

7. It is to be noted that May 1 the department is notified that Admiralty decides to give trial to convoy system and that it will be advised as to its progress. By May 31 it is informed that the first experiment is successful. In other words, no definite plan for operation has been submitted and the department has been requested only to furnish 14 ships for escort duty for New York service. This might readily be interpreted as meaning that the British having taken three years to reach the point of experiment, the Navy Department was expected to meet the situation overnight, and this when no established plan of operation has been submitted. In the meantime we find that the result of the department's policy has resulted from the declaration of war to June 1, 1917, in the loss of 26,765 tons of United States shipping, of which 2,551 tons still represent armed ships and 10,406 tons represent sailing ships, which naturally are to be considered in connection with convoy. At this time, noting the excessive loss to sailing vessels, the department armed a schooner sailing for Italy. The schooner later fought a successful fight with an enemy submarine in the Mediterranean, with probable damage to the submarine. Guns being required for the larger ships made it impracticable to arm sailing vessels as a class.

8. To avoid confusion in the separate subjects of convoys for troop ships and convoys for supply or cargo ships, it is here necessary to enter briefly into the subject of convoy of troop ships in order to bring out the proper sequence of Admiral Sims's correspondence with the department.

On June 6, 1917, the department notifies Admiral Sims of tentative sailing of first troop convoy.

On June 8 Admiral Sims's reply tends to show that there is no definite plan established in the submarine danger zone for the handling of even the troop ship convoys.

On June 10 the department evidently appreciating the lack of definite plan for handling convoys in submarine zone, requests a definite plan be submitted, and it is in reply to this specific request that Admiral Sims submits his letter of June 13 formulating a plan. It is further to be noted that the plan had been submitted principally with troop-ship convoy in mind, though it is used as an argument in presenting the allegation that the Navy Department was holding up cargo-ship convoys. Here it should again be noted that it would require about 10 days for this plan to reach the Navy Department.

On June 14 Admiral Sims cables the department that "there are now sufficient vessels available for escort duty to insure safety of all vital supplies and also prospective movements of our troops and their supplies." Here the department is informed for the first time that the situation, insofar as escort in submarine zone is concerned, is ready to be handled abroad.

On the following day, June 15, the first United States convoy sailed from the United States, or a convoy system for troops was effective.

To return to the problem of establishment of convoys for supply ships, we find—

On June 15 Admiral Sims cables the department, "Strongly urge putting convoy system into effect immediately from Philadelphia, Boston, New York, and North Atlantic ports as previously recommended."

This appears as a rather large field to cover in view of the fact that New York alone had previously been mentioned (and the number of escorting vessels required would be entirely out of the question).

On June 18, the department cabled Admiral Sims as follows:

"Received: June 20, 1917, via Admiralty.

"To: Commander in chief, Queenstown.

"Following for Admiral Sims:

"There will be no additional movements before August of troops. You will be furnished fully with information as to sailing of Army supply ships as far as possible in advance and the actual sailing intended route and probable dates of arrival will be reported. We hope to sail four Army supply ships now fitting out in about 10 days' time. The 32 destroyers which are all that there are available have sailed; 110 fleet chasers which are to be sent to France should begin to deliver in August. Fishing vessels, 12 in number, will sail in August for France. There are no other small craft available at present although work on yachts is being pushed probably ready July 15. In regard to convoy I consider that American vessels having armed guards are safer when sailing independently."

On June 20 Admiral Sims replies:

"Sent: June 20, 1917.

"To: Secretary of Navy.

"Through: Admiralty.

"The immediate dispatch to this area of all possible destroyers and antisubmarine craft of any description is mandatory if the submarine issue is to be effectively met. During absence of destroyers for escort duty with troops transports the forces in this area reduced to only 10 destroyers and 10 sloops, only 6 of each in operation at a time. This requires 5 days at sea with 2 days in port, which can not be continued with reliability. Other areas are similarly short of sufficient forces to meet the situation. Yesterday the majority of these forces were engaged in escorting individual inward-bound valuable ships, thereby leaving all shipping following them unprotected. Ships sunk yesterday as far west as 17:30. It will seem suicidal if the convoy system as proposed by the British Admiralty is not put into immediate operation and applied to all shipping, thus forcing submarines to encounter antisubmarine craft in order to attack shipping. It is impossible to carry on partial convoy and partial patrol system. Both can not be done, the former much better than present system which is not succeeding.

"Urgently request information of department's action on this dispatch and upon previous similar dispatches. A decision is necessary before decisive action can be taken on this side.

"Sims."

The records of the Navy Department show that this was received on June 21 through the British Embassy. It is important to note the dates of these cables and their intent.

The department in its cable has drawn lines between troop ships, Army cargo ships, and American vessels, and evidently had in mind Admiral Sims's cable of June 15.

In presenting his allegations, Admiral Sims, while dealing with the subject of "Antisubmarine craft in war zone," first quotes his cable of June 20 and the following remark, "In reply to the increasing urgent series of messages in June I finally received a message from the department on June 20 which I will now read to you." He then quotes the department's cable of June 18.

Considering his remarks which follow, a fallacy of his allegation is disclosed in the fact that he has misconstrued the times of dispatches quoted.

He says: "I would like to invite attention to that last paragraph, 'In regard to convoy I consider that having armed guards are safer when sailing independently,' and that was signed 'Daniels.' Well, I can assure you that I was about ready to jump overboard when I got that last message. After all the information that had been sent as to the nature of the antisubmarine campaign to be informed officially by the Navy Department, 'In regards to convoy I consider that American vessels having armed guards are safer when sailing independently.' When this message came I realized once more that the department did not appreciate the situation or such a message would have been impossible."

Admiral Sims further remarks, "I would have supposed that anyone who had even casually read the Sunday newspapers would have known that the arming of merchant

ships would have the opposite result as it obliges the submarine to torpedo without warning instead of sinking a ship with its own gunfire."

On June 21 Admiral Sims cables:

"My recommendations concerning the convoy system were not based upon American vessels, but upon all allied shipping, for it is upon the preservation of the remainder of this shipping that our success against the enemy is entirely dependent. It is assumed here that the comparative immunity of American shipping from submarine attack is due to German hopes that such a policy will strengthen the peace propaganda in America. This is apparently clearly shown by the German press. Actual and extended experience has shown that arming merchantmen does not protect them from attack, but simply forces the submarine to attack without warning, thus obliging her to use up her torpedoes and shorten her cruise. Armed merchantmen are being sunk daily off this port." (That is Queenstown.) "The success of the convoys so far brought in shows that the system will defeat the submarine campaign if applied generally and in time. The system is merely a plan that obliges the submarine to fight antisubmarine craft in order to attack merchantmen. The present campaign is not succeeding."

On June 22 Admiral Sims cables:

"To: Secretary of the Navy.

"Sent: June 22.

"The British Admiralty have now adopted the convoy system and will put it into full effect as fast as ships can be obtained for high-sea convoy against raiders and destroyers for escort duty in submarine zone. As previously reported, convoys are in successful operation from Mediterranean and Hampton Roads. Plans are in hand for total of eight convoys a week as follows: Two from Gibraltar, two from Hampton Roads, two or three from New York, one from Canada, the latter preferably being combined with the New York convoys. One a week from New York will be put into operation as soon as possible with British cruisers, in absence of our support. I again urgently advise our full support, assisting and cooperating in assembly of convoys, and furnishing one cruiser or reserve battleship a week for high-sea escort. Reserve battleships are admirably suited for this duty, which will not interfere with personnel training, for which I understand they are now being used."

9. On June 24 the department cables the following to Admiral Sims:

"The department is strongly of the opinion—based on recent experiences—that the question of supplying adequate guns and trained gun crews to merchant ships is one which can in no wise be treated as a minor issue. Coupled with a rigid system of inspection, this method is believed to constitute one of the most effective defensive submarine measures."

Here Admiral Sims remarks:

"There was the opinion formed in America, necessarily without the information that should have been considered in connection with it, which was holding up a convoy system, and which held up for two or three months, and which cost the loss of a number of hundreds of thousands of tons of shipping and some lives. It will be noted that, in this cable, the department reiterates the opinion expressed by the Secretary, four days before, that the arming of merchant ships constituted one of the most effective defensive submarine measures, and implying thereby that it merited more consideration than the convoy system, or, at least, that until it was further developed, it was unnecessary to take the convoy system very seriously. In any case it is difficult to construe these answers from the department, to my specific and urgent recommendations concerning the convoy system, as anything less than what they considered justifiable substitutes for the convoy system. The committee can perhaps imagine my state of mind when confronted with this situation."

On June 28 Admiral Sims cables as follows:

Sent: June 28, 1917.

To: Secretary of the Navy.

From: Queenstown.

Referring to department's opinion, reported in last two cables, to the effect that adequate armament and trained crews constitute one of the most effective defensive antisubmarine measures, I again submit with all possible stress, the following based on extended British war experience. The measures demanded if enemy defeat in time is to be assured, are not defensive but offensive-defensive. The merchantmen's inherent weakness is a lack of speed and protection. Guns are no defense against a torpedo attack against armed ships. In this area alone, during the last six weeks, 30 armed ships were sunk by torpedoes without submarine being seen, although 3 of these were escorted each by a single destroyer. The result would have been, of course, the same no matter how many guns these ships carried or what their caliber.

Three mystery ships, heavily armed, manned by expert naval crews, with much previous experience with submarine attack, have recently been torpedoed without warning. Another case within the month of mystery ship engaging submarine with gunfire at 6,000 yards, but submarine submerged and approached unseen and torpedoed ship at close range. The ineffectiveness of heaviest batteries against submarine attack is conclusively shown by Admiralty's practice always sending destroyers to escort their men-of-war. The comparative immunity of the relatively small number of American ships, especially liners, is believed here to be due to the enemy hopes that the pacifist movement will succeed. Cases are on record of submarines making successful gun attacks, from advantageous sun position, against armed ships, without ship being able to see submarine. I submit that if submarine campaign is to be defeated, it must be by offensive measures. The enemy submarine mission must be of destruction of shipping and avoidance of antisubmarine craft. Enemy submarines are now using, for their final approach, an auxiliary periscope less than 2 inches in diameter. This information just acquired.

All of the experience in this submarine campaign to date demonstrated that it would be a seriously dangerous misapprehension to base our action on the assumption that any armament on merchantmen is any protection against submarines which are willing to use their torpedoes. The British have now definitely decided the adoption, to the maximum practicable extent, of convoys from 16 to 20 ships. This is an offensive measure against submarines, as the latter will be subject to the attack of our anti-submarine craft whenever they come within torpedoing distance of convoys of merchantmen. Moreover, it permits of concentrated attack by our forces, and obliges the enemy to disperse his forces to cover the various routes of approach.

Concerning department's reference to a scheme for protection of merchant shipping, which will not interfere with present escort duties, I submit that the time element alone prevents utilization of any new antisubmarine invention. The campaign may easily be lost before any such schemes can come into effective operation. The enemy is certainly counting on maximum effort being exerted before long nights and bad weather of autumn; that is, in the next three months. Heaviest effort may be anticipated in July and August. I again submit that protection of our coast lines and of allied shipping must necessarily be carried out in field of enemy activity if it is to be effective. The mission of the Allies must be to force submarines to give battle. Hence no operations in home waters should take precedence over, or be allowed to diminish the maximum effort we can exert in area in which enemy is operating, and must continue to operate in order to succeed.

SIMS.

10. On June 26 French cabled Washington as follows:

[Translation.]

"From: French Naval General Staff, first section, Paris.

"Date: June 26, 1917.

"To: French naval attaché, Washington.

"Replying to your telegram, at the request of Admiral Benson, we have considered, in concert with the British Admiralty, before the entrance of the United States into the war, the principle of the grouping in convoys of merchant ships across the Atlantic with protection by cruisers. The cruisers are intended to protect the ships against pirates and the new large submarines. They shall conduct the convoys to the approach entries, where destroyers will assure the escort to the port of discharge. Admiral Grasset has received instructions to make arrangements with the British admiral at the Bermudas, and have these cruisers perform escort duty.

"We are quite ready to consider, in concert with the American Admiralty, a new distribution of the allied cruisers for the protection of merchant ships and transports. We will, moreover, communicate to Capt. Jackson all the information we possess on the matter."

11. On July 1 Navy Department proposes shipping intelligence officers for shipping.

On July 3 Admiral Sims submits recommendation for same.

On July 2 Navy Department proposes routing system for convoy.

On July 3 Admiral Sims submits recommendation for same.

On July 11 Admiral Sims receives a letter from Admiral Jellicoe relative to convoy.

On July 12 Admiral Sims cables the department his recommendation relative Admiral Jellicoe's letter.

After presenting communications of July 11 and July 3, Admiral Sims remarks:

"I am going into this thing at some length because it is the most important measure that was taken during the war, and consequently the continuous resistance for a number of months to the introduction of that convoy system by the Navy Depart-

ment is the most serious error that was committed. In spite of these recommendations the fact remains that it was found necessary to keep the British offices going throughout the war, and that the department set up an independent duplicate organization in the principal ports of the United States, thereby wasting both officers and money."

On July 14 Admiral Sims submits further recommendations for convoy, etc., and on later dates further correspondence relating to details and with attending criticisms. But the main point to be brought is that on July 14 a convoy of cargo ships, including United States armed merchant ships, sailed from New York under escort of United States cruiser with signalmen of the United States Navy in each ship to maintain communication. In other words, the convoy system as recommended has been put into effect.

To analyze the previous situation to determine whether the Navy Department was furnishing "continuous resistance for a number of months," we find—

1) On April 19 by letter Admiral Sims states: "The best policy is one of dispersion." (This letter probably received Apr. 29.)

2) On April 30 Admiral Sims cables, "Admiralty making study of convoy system."

3) On May 1 Admiral Sims cables, "Admiralty has decided to give trial to convoy scheme."

4) On May 25 Admiral Sims cables, "The principle of convoying merchant ships is approved by Admiralty."

5) On June 6 Navy Department notifies Admiral Sims of tentative sailing of troop convoy.

6) On June 8 Admiral Sims not ready to handle even troop-ship convoys.

7) On June 10 department requests plan for handling convoys in submarine danger zone.

8) On June 14 Admiral Sims reports ready for troop-ship convoys.

9) On June 15 troop-ship convoy sail.

10) On June 13 (by letter) Admiral Sims forwards plan, principally relating to troop-ship convoys.

11) On June 22 Admiral Sims cables recommending one convoy a week from New York.

12) On July 14 we find a convoy escorted by United States cruisers sailing from New York and thereafter at regular intervals, as shown by following dates:

July 14, July 22, July 28, August 7, August 14, August 22, August 30, September 7, September 15, September 23, etc.

Though further correspondence between Admiral Sims and the department would tend to show that, whereas the convoy system was in actual effect, the definite plans for its proper functioning had not been worked out. Here the convoy subject will be dropped, it having been clearly shown that the department had not resisted the convoy plan for several months, nor had the arming of merchant ships prevented its adoption. In fact, it could readily be said that the department inaugurated convoys before the escorting forces in the submarine danger zone were prepared to handle the situation.

12. As Admiral Sims has included several depreciative remarks which cast reflection upon the efficiency of the policy of arming United States merchant ships and would lead one to believe that such a policy was worthless, an analysis of the phase of the situation will follow:

There was a clearly defined policy, which policy was immediately put into effect, has been shown (see estimate of situation and regulations).

Further, this policy did not interfere with the introduction of the convoy system. In fact, rather than delay the convoy system, it actually did, through the establishment of military personnel in the merchant marine, greatly assist in making the convoy system effective.

That it developed into a major operation is shown through the figures that 384 merchant ships were armed and 30,000 of the Navy personnel were at one time or another engaged in this branch of service.

Before showing the actual effectiveness of this policy answer will be presented to various statements made by Admiral Sims.

After representing that he cabled on June 20, "It will seem suicidal if convoy system proposed by British Admiralty is not put into immediate operation and applied to all shipping," and that the department replied, "In regard to convoy we consider that American vessels having armed guards are safer when sailing independently" (the fallacy of this representation has been previously shown), Admiral Sims remarks, "When I got that last message I was about ready to jump overboard," and "I would have supposed that anyone who had even casually read the Sunday newspapers would have known that the arming of merchant ships would have the opposite result, as it obliges the submarine to torpedo without warning instead of sinking a ship with its own gunfire."

Had these remarks been made at that date they might be overlooked, but they are evidently his views after nearly three years' consideration.

The general conditions at that time are but little changed from those brought forward previously to the date of May 30, 1917, but again special notice should be made of the difference between the arming of United States and British ships.

From May 30 to June 30, 1917, we find the following serious encounters between armed United States merchant ships and enemy submarine:

First. May 30, steamship *Silvershell*.

Second. June 1, steamship *Mongolia*.

Third. June 4, steamship *Norlina*.

Fourth. June 6, steamship *William O'Brien*.

Fifth. June 10, steamship *Virginian*.

Sixth. June 10, steamship *Petrolite*.

Seventh. June 12, steamship *Moreni*.

Eighth. June 14, schooner *Glynn*.

Ninth. June 16, steamship *Archbold*.

Tenth. June 23, steamship *Wico*.

Eleventh. June 25, steamship *St. Paul*.

To be brief, of the above-mentioned cases, three repulsed the submarine attack with probable damage to the submarine. Five successfully drove the attacking submarine away and two were torpedoed before submarine was sighted, but torpedo was sighted before striking ship. One ship was sunk by gunfire after an engagement lasting two hours and only after the ship (which was a tanker) was a mass of flames and all available ammunition expended. The records of these cases will show that the policy of arming ships was more effective than merely "obliging the submarine to torpedo without warning." Should a comparison be made of the effectiveness of the British policy to protect her merchant marine even "after extended British war experience," with the policy of the United States made effective almost over night, the results will most certainly favor the United States.

15. Admiral Sims in his cable of June 21, 1917, states, "The comparative immunity of American shipping from submarine attack is due to German hopes that such a policy will strengthen the peace propaganda in America." The above record of engagements for June, 1917, hardly bears out this statement.

Admiral Sims, in his cable of June 21, 1917, further states, "Armed ships are being sunk daily off this port (Queenstown)," and in his cable of June 28, 1917, "In this area alone during last six weeks 30 armed ships were sunk by torpedoes without submarine being seen although 3 were escorted each by a destroyer."

To that period, only two United States armed ships were torpedoed. As to the word "vicinity" it is not known just what is to be included, but the two ships mentioned were the steamship *Petrolite*, torpedoed June 10, 1917, 130 miles off Cape Spartel, Morocco, and the steamship *John D. Archbold*, torpedoed June 16, 1917, 85 miles southwest of Penmarch, France.

Though Admiral Sims distinctly states that his efforts were directed not only in the direction of the United States, but rather in the interest of the allied merchant marine, it could hardly be expected that the Navy Department could at such short notice be prepared to take immediate steps beyond the limits of the United States shipping. That it did this, and in an effective manner, has been shown. Had it accomplished only the purpose Admiral Sims lays down (that of forcing the enemy to use its torpedoes), it would have been of considerable value. In fact, Admiral Sims puts the value of a cruiser in the same general class.

So it must appear that Admiral Sims based his recommendations on the failures of other nations rather than on the United States.

16. Another point to be brought here deals with the mission of arming merchant ships.

Admiral Sims says in cable of June 21, "Actual and extended experience has shown that arming merchantmen does not protect them from attack without warning, but simply forces the submarine to attack without warning, thus obliging her to use up her torpedoes and shorten her cruise."

In cable of June 28, he says, "Guns are no defense against a torpedo attack without warning," and in the same cable, "It would be a seriously dangerous misapprehension to base our action on the assumption that any armament in merchantmen is any protection against submarines which are willing to use their torpedoes."

Here let us look at the mission for which the Navy Department armed the merchant ships.

- (1) As a defensive measure against attack by enemy submarines.
- (2) To provide a lookout system to prevent sudden attack.
- (3) To provide communication between ships while sailing in convoy.

4 To provide military representatives on civilian-operated ships.

As a defensive measure against attack, it accomplished its mission when—

3 It prevented successful attack made by gunfire.

2 When by its gunfire it kept the submarine submerged and so disconcerted it that it could not take the proper reckonings or make approach for torpedo attack.

The lookout system accomplished its mission when—

1 First sighted the enemy in time to prevent its making a successful attack.

This was accomplished either by sighting the enemy in time to permit the vessel to maneuver to avoid a torpedo or in time to drive off the submarine by gunfire. Communication in convoy was accomplished by putting United States Navy signalmen and radiomen in all United States merchant ships.

Military representatives allowed the Navy Department to obtain first-hand information as to whether merchant ships were carrying out rules and regulations prescribed—this latter was of considerable importance, particularly in enforcing convoy and furnishing valuable information to the Department of Commerce and Bureau of War Risk Insurance.

Whereas many cases could be presented that each and all of its missions were most favorably accomplished, the following general résumé should speak for itself and demonstrate that the effectiveness of the Navy Department's policy far exceeded Admiral Sims's views on the subject.

During the period in which the United States was at war—

384 merchant ships were armed and 1,832 trans-Atlantic trips were made by these ships.

347 attacks by enemy submarines were reported.

227 attacks by enemy submarines were classified as "Actual."

29 ships were sunk under classification "Torpedoed."

2 ships were sunk by shell fire, one of which a tanker caught fire after a running fight of two hours' duration, the other was sunk only after all ammunition had been expended in a running fight of over four hours' duration.

193 attacks were successfully repulsed.

34 attacks resulted in probable damage to the enemy submarines.

2,738,026 tons of United States shipping were armed.

166,428 tons of United States armed shipping were sunk by enemy submarines.

As a result of attacks successfully repulsed, approximately 1,400,000 tons of United States shipping was saved.

The history of the engagements of the armed guards serving on board the ships of the United States merchant marine, furnishes one of the most interesting features of the participation by the United States in the World War and that it was not only interesting but one of the most effective measures undertaken by the Navy and one of which the Navy should be duly proud rather than criticized and condemned, it is believed has been clearly demonstrated.

(Secret.)

MARCH 6, 1918.

From: Chief of Naval Operations.

To: Chief of Debarkation Service, United States Army; chairman Shipping Board; Bureau of Navigation; Bureau of Ordnance.

Subject: Merchant vessels in trans-Atlantic service to carry armed guard.

1. Latest reliable advices from abroad indicate that the Germans are putting into service from 8 to 12 large cruising submarines of 3,000 tons displacement, 18 knots surface speed, and armed with one or two 6-inch guns. These craft may be in service during March. As the Germans have from time to time extended the range of their submarine activities, it is fair to assume that the addition of these craft to their forces will enable them to still further extend the scope of their operations. These submarines, while not so effective as smaller craft when operating under water, are, from the character of their armament, dangerous to unarmed ships sailing without some form of protection.

2. While the escort system is, up to a certain degree, protection against the surface attack of submarines, if the escort be heavy and numerous enough, still its efficiency is to an extent dependent upon the guns of the convoyed vessels themselves, and were the convoy so numerous as to hamper the movements of the escort, a gun attack from the rear or flanks on the unarmed convoy does not seem an impossibility. On the return voyage, all vessels which are convoyed eastward sail direct and alone for their port of destination, once they are convoyed beyond the supposed danger zone. The possibility of the extension of the zone of submarine operations even to our

coast has rendered it possible what these fast cruising submarines might find it profitable to attack single slow unarmed ships near our coast.

3. While the department has made every effort not to slow shipments, even stating that it felt a reasonable degree of safety was insured to unarmed ships while in convoy, this statement was only intended to apply to the ships while in convoy and operations close to the European shores. For the reasons given above the department deems it wise, before the return of summer and good weather, to state that it believes that time ripe to return to its original policy of insisting that vessels engaged in the trans-Atlantic trade should be armed, and carry either an armed guard or be manned by a trained personnel.

W. S. BENSON.

NOVEMBER 11, 1918.

Secret.

From: Chief of Naval Operations.

To: Embarkation Service, United States Army; chairman Shipping Board; Bureau of Navigation; Bureau of Ordnance.

Subject: Arming and manning merchant ships.

Reference: (a) Letter No. 28754-1:25/229, Op-28, Mar. 6, 1918; subject, Merchant vessels in trans-Atlantic service to carry armed guards.

1. In this war the foes of the merchant ship, which it may encounter and which it may partly through its own efforts it may defeat, if properly equipped and handled, are—

- (a) Armed raiders.
- (b) Cruising submarines, armed with heavy guns.
- (c) Smaller submarines, relying on torpedo attack.

The first two classes rely upon gun attack largely. The last depends upon the torpedo and mine for its successes.

2. Broadly speaking, the Navy has two general aims, which are, tersely expressed—

- (A) To win the war.
- (B) To safeguard the future.

And of the two (A) naturally is paramount in importance.

3. Apart from the purely naval features which are not the concern of this letter, the Navy is, in its attitude toward merchant shipping, faced with the problem of adjusting its (A) and (B) of the merchant ship problem with the (a) (b) and (c) of paragraph 1, viz, the character of enemy our merchant ships do and may encounter and the localities where such enemies may operate.

4. To meet this situation stated in paragraph 3, the Navy has adopted the following policy:

(C) In those localities where the enemy operates or is liable to operate the merchant vessels to be efficient and to do its full quota toward helping win this war must in zones of danger be (1) properly handled; (2) properly armed; (3) adequately escorted where escort is needed.

5. Referring to paragraph 4, and confining this letter strictly to the water operations, a strict interpretation of (1), properly handled, must mean organized, administered, and operated. To carry out (2), properly armed, the Navy has attempted to furnish guns. To carry out (3), adequately escorted, the Navy has assigned its cruisers and destroyers.

6. To sum up, the Navy felt that in the zones of danger at sea, as on the firing line on land, military principles and practice should prevail, and to that end believes that three things should be put into effect on merchant ships to make these principles and practice effective.

(1) Merchant ships crossing the danger zones should be commissioned and manned with naval crews.

(2) Or else should be provided with an armed guard.

(3) Arm all ships crossing the danger zones.

The Navy did not concern itself with ships outside the zones of enemy operations. This is a general statement of the theoretical policy which it is believed the Navy ought to adopt toward merchant shipping in order to give it the individual protection apart from escort, to which it is entitled.

7. The practical solution of a theoretical aim is, however, a matter of adjustment and this statement applies with equal force to both the material and personnel factors.

8. As the matter stands to-day, the Navy does—

- (a) Man all ships turned over for Navy use.
- (b) By joint rules, approved by the President, man Army troop transports and cargo ships.

(c) Provide guns for all ships crossing the Atlantic, where the guns are available, and where installing guns does not too greatly interfere with the operations of the ships.

9. While reaffirming the principles stated in paragraph 6 the Navy will, in the matter of manning, as a matter of adjustment between the Army and Ship Control Committee, whenever it is satisfactory to the Army, consider that the term transport means (1) all ships carrying troops; (2) any ships that regularly carry Army stores across the Atlantic, voyage in and voyage out; (3) all such ships shall be gunned.

10. In the policy of arming ships the Navy provides at present (a) four guns or more for all troop ships; (b) two guns for cargo ships; (c) it does not provide guns for ships not entering the present danger zones owing to scarcity of guns.

11. While reaffirming the principle that ships operating in the danger zones should be armed and manned with naval personnel, and while further asserting that the danger of submarine operations on our own coast is an ever increasing one, as a matter of adjustment the Navy will continue to attempt to furnish guns in the following order of importance:

(a) Four to all troop-carrying ships; (b) two to all regular Army cargo ships crossing the Atlantic; (c) two to all other cargo carriers of 5,000 tons or over crossing the Atlantic; (d) two to all other cargo carriers crossing the Atlantic, where the installation of guns would not so seriously interfere with the carrying of cargo as to greatly handicap the service of said craft as a cargo carrier, and where said armament is desired; (e) not to arm merchant ships engaged in coastwise traffic on the Atlantic until the other classes above mentioned are provided for, but to attempt to afford the necessary protection by the aid of escort furnished by the naval districts until such time as guns are available and their need is demonstrated; (f) not to arm ships engaged in the Pacific trade at the present, until the need is demonstrated.

12. To provide for suitable escort ships of the cruiser type, vessels which combine the qualities of troop and cargo carriers with those of escort, the department is of the opinion that immediate steps should be taken to fit out every tenth ship of the new type building for the Emergency Fleet Corporation (type 16 to 18 knot, carrying 1,200 troops adopted as standard by the standard plans committee) with not less than eight 5-inch guns or better, instead of four, in order that the number of self-contained escort ships may be increased.

13. It is recommended, however, in all cases of new construction, or when alteration and repair allows the time, that gun emplacements be fitted for all ships, including those of the Pacific, except in the cases of ships engaged in the coastwise trade which are structurally unfit to carry guns, and which it would be manifestly uneconomical to attempt to arm.

14. Finally, as to the Navy's policy toward the merchant marine in the future. While the Navy standards may be high, it is believed that to make the merchant service attractive for American sailors the former standards must be raised. The question of just compensation to owners, charterer, and crew should be one capable of fair adjustment. The Navy has no desire to control merchant shipping after this war is over. Its most earnest wish is to see developed a merchant marine which will be a pride to our country, and which will fly the American flag in every ocean, as our ships before the Civil War.

OCTOBER 11, 1917.

[Taken from Admiral Mayo's report after visit to European waters.]

GENERAL NOTES ON THE CONVOY SYSTEM AND THE SHIPPING SITUATION.

[Paragraph 15.]

a. (1) The principal antisubmarine effort is to-day being exerted in escorting convoys through the submarine-danger zones in the Atlantic and North Sea and Channel. The convoy system will soon be in operation in the Mediterranean.

(2) The reduction in the per cent of losses of vessels in convoy has given rise to hopes that the adoption of the convoy system by all ocean-going vessels will reduce the submarines' menace below the danger point.

(3) Such an assumption is dangerous without more experience than has been had yet, and as the convoy system has only been in operation during the latter months of the fair weather of summer, the difficulties attendant upon operations in the gales of winter and the fogs of fall and spring must be carefully considered.

(4) The convoy system is strategically defensive though tactically offensive. This defensive is merely a counterattack. Such operations on land are never decisive, and less coupled with strategically-offensive operations, are more than apt to fail on the land. Convoy operations can not win the war. They may, if successful, prevent defeat. Unless the navies of the allied forces are satisfied to let the armies or political conditions settle the war, a more offensive plan is essential.

(b) (1) From present prospects the decision on land is far-distant. The people of the European nations at war are war-weary; the losses on land are enormous. Unless the Navy can unmistakably check the submarine menace, the war is apt to be decided by political or labor conditions.

(2) National morale is to-day the vital point, and the effect on allied morale of a successful check to the submarine would be to raise it beyond any possibility of breaking. Likewise, this would so reduce the enemy's chances of winning the war that the morale of the Central Powers would be likely to break.

(c) The convoy system should be regarded merely as a defensive operation carried on while preparing for an offensive. Such an attitude does not prevent thoroughness in carrying out the operation and in order that it may be successful in its rôle, requires careful study to anticipate the changed conditions of the winter and the possible operations which may be conducted by the Central Powers to break up the system.

(d) (1) The convoy system requires the assembly of from 15 to 20 vessels, most of which are run on a schedule of 1 every 8 days. Assuming that on the average there is a delay of 2 days in and 2 days out in a round trip, and that the average time for a round trip is 50 days, it will be seen at once that this is equivalent to a reduction in shipping of 8 per cent. In addition to this, there is the congestion of ports due to arrival and departure of large groups of ships practically simultaneously, which reduces the rapidity of discharge and loading.

(2) In order to make up for the loss in tonnage due to controlled sailings, it is necessary to attain the highest efficiency of employment of all ocean-going merchant tonnage. In order to accomplish this, it is essential that all merchant shipping be controlled as to route, ports, and cargo by the Government, and that the Government representatives coordinate their efforts with the corresponding representatives of the Allies.

(3) An instance will indicate where the savings can be made: There are about 400 ships a month trading from the southeast coast of South America direct to the United States. Most of these ships are American or neutrals operating on an American time charter. This trade is no doubt profitable, but it is doubtful if it is essential to the conduct of the war.

(4) The United States and the Allies must consider carefully what peace-time trade can be dispensed with to meet the very serious shipping situation now before us.

(5) The efficient employment of such shipping as is available, for the transportation of materials essential to the conduct of the war, offers one of the most promising fields for reducing the actual shortage of shipping.

(e) *Defense of convoys against raiders.*—(1) The means at the disposal of the enemy with which to attack the convoys are:

1. U-boats.
2. *Deutschland* type of submarine cruisers.
3. Raiders (armed merchant ships).
4. Cruisers.
5. Battle cruisers.

(2) It appears that the system of protection for convoys now in operation is efficient so far as the resources available permit. The losses of vessels in convoy to the loss of vessels not in convoy is at present about 1 to 20. Of course the greater safety of the submarine in attacking vessels not under escort leads to a pervulence of this form of attack and undoubtedly when all vessels are in convoy the proportion of ships sunk will not decrease in the above ratio.

(f) (1) The merchant captains state that in the bad weather of winter it will be impossible for ships in ballast to operate in convoys so it seems that the proportion of shipping in convoy can never (for the next few months) exceed 50 per cent.

(2) The dispersion of convoys and the difficulty of maintaining position in convoys during fogs and gales will seriously reduce the efficiency of this system during the winter.

(3) The bad weather and long nights will however seriously reduce the efficiency of the submarine and it is believed that the rate of sinkings from U-boats will remain practically constant.

(g) (1) The introduction of the cruising submarine with its long radius of action will move the submarine menace further from the coast of Europe and thus necessitate more extensive destroyer escort operations. At present the force available does not permit this extension but as the number of submarines of this type is limited (probably six) this disadvantage must be accepted.

(2) This type of submarine is fitted with one or two guns 5.9-inch in caliber and is designed to use this gun as its primary weapon. The system of ocean escort is a partial answer to this form of attack.

(4) (1) The raider and cruiser menace are similar and can be considered together. It is quite possible that the raiders or cruisers so employed would have a battery of 6-inch guns and therefore the ocean escorts should be vessels with batteries not less than 6-inch.

(2) In view of the difficulty that would be experienced by one cruiser in guarding a convoy of 15 or 20 ships against a raider of equal speed, it seems that the enemy will use fast ships and those of merchant ship type with sufficient speed being rare, they probably will be cruisers.

(3) The enemy cruisers, however, have rather short radius of action and consequently could not operate long on the main trade routes unless they could obtain fuel from ships engaged in unneutral service. In view of this fact particular investigation of all ships not sailing in convoy should be made and coal cargoes should be made to destination. Vessels with cargo of fuel should be made to travel in convoy.

(4) The threat from raiders or cruisers could best be met by increasing the number of ocean escorts with each convoy, but due to lack of suitable vessels this is an impossibility unless escort by battleships is adopted.

(5) (1) The most serious threat is that by enemy battle cruisers. If one of these vessels accompanied by a fast supply ship, and preceded by a submarine scouting force, could get to sea the possible damage that could be done would be enormous.

(2) Very serious thought must be given to this possibility and the secret service of the Allies should be directed to ascertain information indicating that any such arrangements are in preparation or even contemplated.

See details in reference (f) and inclosure F.

There were some points brought up the other day in Admiral Strauss's testimony about the northern barrage, and as you gentlemen said you were going to ask some questions and go into the matter a little more fully, I have here submitted the entire history, and I have put markers in at certain important points, one of the important points being the inception of the problem. As I said before, Capt. Fullenwider, who is practically the father of the idea, used to come over and talk with us in the plans section of operations almost every day, long before we went into the war, in February, the beginning.

He carried this idea so far that finally on April 15, 1917, he submitted the following paper, which I offer here:

CONFIDENTIAL MEMORANDUM.

APRIL 15, 1917.

Subject: Antisubmarine warfare.

1. To consider adequately and properly the means and methods of overcoming the submarine menace, it is necessary to consider the various elements of the war situation. The questions involved being political, economic, and military as well as naval.

GENERAL CONSIDERATIONS.

The European deadlock.

2. The military situation in Europe is practically a stalemate. In France the British-French forces appear to have a slight advantage, but at the recent rate of progress it will take years to force the Germans back to their frontier.

3. The Italians are holding their own, but without prospect of decisive victory.

4. In the Balkans the Allies have not sufficient force, apparently, to obtain a decision, and the submarine menace may be expected to interfere greatly with the transportation of reinforcements even if the Allies can spare men from other fronts.

5. The Russians are holding, but the staying power of the new Government is doubtful in view of possible internal dissensions. Russia apparently lacks cohesion and unity and can not be relied upon for increased effectiveness.

6. In Asiatic Turkey the Allies are making progress slowly, but even complete victory there would not materially affect conditions in Europe.

7. It is doubtful if the German forces have reached their maximum; but, assuming that they have, so also have those of Great Britain, while those of France have been in the decline for some time. The one remaining source of man power among the Allies in Europe is Russia, but it is doubtful whether that supply can be utilized

without greatly increased assistance from without in the munitioning of the Russian armies.

8. In short, it does not appear that a decision can be expected except through the influence of sea power.

The naval situation.

9. Through her control of the surface of the seas, Great Britain has made the position of the Central Powers complete, and there can be but little doubt that Germany is in distress through want of certain supplies, but there is no assurance that she will reach her limit of endurance within the next two years. On the other hand, Germany by her submarine warfare on shipping is seriously curtailing Great Britain's imports. Great Britain being far more dependent than Germany upon importation of food will be more quickly starved into submission by an effective blockade. While starvation for Britain is doubtless far off, it is a fact that she is now keenly feeling her tremendous loss of shipping, and apparently she has thus far found no means of effectively combating the submarine peril.

10. The result of the war hangs upon the submarine issue. Germany will win the war if she can continue the rapid diminution of merchant shipping. The only hope of the Allies (including America) lies in finding means to curb the effectiveness of the submarine and replacing lost ships, and any further delay will be fatal.

11. If the submarine menace can be materially diminished, the war can be brought to a successful conclusion probably within a year.

HOW MERCHANT SHIPPING CAN BE PROTECTED.

12. The question as to how merchant ships can be protected divides itself into two parts; first, the destruction of hostile submarines; second, the means of making individual merchant ships comparatively safe from torpedo attack.

ANTISUBMARINE MEASURES.

24. There are three general lines of attack on submarines, viz:

- (a) Destroy them at their home base.
- (b) Prevent their egress from or ingress to their home port.
- (c) Hunt them down and destroy them at sea.

25. Under existing conditions in Europe, attack upon submarines at their home base is practicable only from the air, and the difficulties attending this are formidable. Given a large fleet of bomb-dropping Zeppelins, with an over-riding force of battleplanes to beat off hostile aircraft, it should be possible to build up damage, if not destroy, any German naval base on the North Sea, though it may require the sacrifice of a large number of aircraft.

26. If Dutch and Danish territory could be used as aeronautical bases, the problem would be much easier of solution, since the German naval stations are within easy flight from those territories; but Holland and Denmark will probably remain allied because they lack the power to prevent German invasion.

27. The sealing up of German ports and denial to the submarines of a northern base on the sea is a more promising line of attack but this also presents grave difficulties, notwithstanding the Allies' superiority at sea. The means at hand are:

(a) Mines so placed that a submarine could not pass. This method involves the necessity of control of the surface waters to prevent mine-sweeping, countermining, etc.

(b) Submarine nets: Nets also require protection and are of doubtful value against large submarines which are now fitted with cutters.

(c) Entanglements: So placed as to foul submarine propellers. These are designed as to be fairly safe against the usual methods of dragging and cutting, but are of doubtful value.

(d) Entanglements or nets with bombs: This is the same as above with the addition of small mines or bombs attached.

28. All measures for sealing ports or channels present the difficulty that the Germans have so extensively mined their waters and have such supervision and control as to render such measures almost, if not, impracticable. It is possible to establish mine barriers in zones at a distance from the German coasts, thus sealing up the North Sea. This will require between 500,000 and 1,000,000 mines.

29. The third line of attack, that is, the hunting down and destruction of submarines at sea, is impossible of complete success, but is the only one presently available. The means of attack are:

Surprise attack on the surface of destroyers or other fast light boats armed with 3-inch guns, but 3-inch guns are of doubtful value against most recent U-boats. U-boats will not often be surprised on the surface, since they can submerge in one to three minutes, and have means of detecting the presence of a vessel at a considerable distance.

Trap nets, fixed: These are invaluable in the rare event of a submarine attempting to enter a protected harbor or area. In such an event, a destroyer or patrol boat could drop depth mines or bombs on or near the U-boat.

Towing nets: A light net, say, 1,000 feet in length towed by destroyers, trawlers, or other light craft with the object of trapping or entangling a submarine, which could then be destroyed by depth mines as above.

Indicator nets: Same type of net as the towing net, but buoyed in the open sea elsewhere to foul a submarine, the resultant position of which would be indicated by the action of the buoys. Its position being indicated, it would be destroyed in the same manner by depth bombs.

Entanglements: These may be of various descriptions, depending upon material used, the object being to entangle the submarine or its screw in such a manner as to compel her to rise to the surface and expose herself to gun fire or to indicate her position so that she might be destroyed by depth bombs.

Towing mines, or towing torpedoes: Designed to be towed by fast boats in such a manner that the towline, and eventually the mine, will foul the submarine and destroy it. A properly designed towing mine apparatus would enable a destroyer or patrol boat to sweep a width of probably 500 feet and foul the submarine therein at any depth, 60 feet of the surface, or other predetermined depth.

Aircraft: Planes to locate the submerged submarines and to destroy them by dropping bombs.

Shells: Needed, high-explosive, nonricochet shell for use in 3 to 6 inch guns; delayed-action.

Possible developments are:

1. High-speed torpedo carrying a heavy charge with time or distance fuse to destroy submerged submarines.

2. High-trajectory bomb thrower or howitzer bomb to carry at least 150 pounds of explosive and to have a delayed-action fuse; range, 1,500 yards; mount to give flexibility to permit of installation on merchantmen and other vessels capable of carrying them.

SUMMARY.

Things that must be done to win the war: First, stop the submarines at their source; build unsinkable merchant ships; and further delay will be fatal.

Barriers for the North Sea.

By political arrangement Danish and Norwegian waters can be mined. If by allied forces, it will become necessary to inclose the North Sea by barriers.

Northern barriers would extend from the mideastern coast of Scotland to the western coast, a distance of about 250 miles. In this case also the neutrality of Ireland would be involved, but it is unavoidable. The maximum depth on this line is the average depth about 240 feet.

Southern line would extend from the southeast coast of England to a point on the coast near the Belgian frontier, a distance of about 40 miles. Maximum depth 150 feet; average depth, 60 feet.

In connection to the North Sea barriers, it would be necessary to close the Adriatic by mines.

Providing that a special form of mine is used carrying 50 pounds of T. N. T. and laid out horizontally and vertically, there would be required for the North Sea the following:

| | Mines. |
|------------------------|----------------|
| For the North Sea..... | 750,000 |
| For the Adriatic..... | 24,000 |
| Total..... | 774,000 |

Based on the assumption that the Adriatic and the eastern Mediterranean, and a reserve supply of mines, would bring the total number of mines required to about 1,000,000. Assuming a factory to produce 1,000 per day each, these mines could be produced in 1,000 days.

39. On the basis of 50 pounds of T. N. T. per mine, there would be required 50,000,000 pounds of T. N. T. or equivalent explosive.

40. There would be required at least 40,000,000 feet of steel wire rope for mooring the mines.

41. These figures are given to indicate the magnitude of the work of preparation any such plan is to be adopted, and to show the necessity of immediate definition of policy. If an immediate decision should be made, the proposed barrier scheme could not be put into effect inside of six months.

S. P. FULLINWIDER.

NOTE.—The mines above referred to were a special new type of small and cheap mine under tentative design and consideration. The design was never finished owing to the development of the Mark VI mine which was regarded as more suitable for antisubmarine barrages.

The CHAIRMAN. What was the date of that?

Capt. PRATT. April 15, 1917.

The CHAIRMAN. That was before we had antennæ mines?

Capt. PRATT. Yes; before we had the antennæ mines.

When the antennæ mine became developed, it then became a feasible project, and was taken up. Commander Belknap was appointed to handle the work in the Office of Operations; the Secretary approved the plan as soon as it was presented to him, and as soon as the organization was drawn up. I know I handled it myself with him one night at 6 o'clock, in company with Capt. Belknap, and the work proceeded from then on. When the operation became one of greater magnitude, involving a flag command, Admiral Strauss was appointed to command the operation, and he took the force abroad and operated it. I submit the history of that northern barrage.

(The document referred to is here printed in full in the record, as follows:)

THE NORTHERN BARRAGE.

CHAPTER I.—CONCEPTION AND INCEPTION OF THE NORTHERN BARRAGE¹ PROJECT.

The northern barrage was one of the most important naval projects carried out by the United States during the war. To appreciate the importance of the barrage as a factor in the prosecution and winning of the war, one must consider the general military situation as it existed in April, 1917, when the United States threw her weight into the scales with the Allies. There was every reason at that time for a pessimistic view of the situation. The military situation on the West Front was practically a stalemate. The French and British forces appeared to have a slight advantage over the enemy, having made small gains here and there; but they plainly had little or no prospect of obtaining an early military decision. The Italians were holding their own, but with no prospect of decisive victory.

On the east front, the Russians were holding for the time being; but there were ominous indications that the newly established revolutionary government would be unable to overcome internal dissensions and that the Russian power might crumble at any time.

In the Balkans the Allies had insufficient force, apparently, to prosecute an offensive campaign; and the growing submarine menace in the Mediterranean seriously threatened the lines of communication by which this force was sustained. In fact, there was grave danger, especially in view of the pro-German attitude of the then Greek Government, that the Allied Force based on Saloniki would have to be withdrawn and the entire Balkan peninsula given up to the Central Powers. In Asiatic Turkey the British were making slow progress in Mesopotamia; but it was doubtful whether victory there would have any material effect on conditions in Europe.

In short, at the time of the entrance of the United States into the war, there was no prospect of victory over the Central Powers unless and until heavy American forces could be sent to Europe to turn the scale. America was not ready, and could not be

¹ This barrage was known in the United States as the North Sea barrage; but, since it was termed by the British "Northern barrage," and since there were other shorter and minor mine barrages planted in the North Sea by the British, the title "Northern barrage" will be used in this narrative.

expected to create and equip an adequate army within at least one year, or probably two.

The sending of an American Army to France would necessitate the safeguarding of the lines of communication across the Atlantic; in other words, the result of the war was seen to hang upon whether or not the Allies and the United States could obtain and hold the mastery of the sea.

As in all wars in which maritime nations have been engaged, sea power was to prove the decisive factor. The British fleet and the naval forces of the United States and other associate powers were supreme on the surface of the sea, and had it not been for the submarine there would not have been the slightest occasion for doubt of a quick and satisfactory outcome of the war; but the surface fleets were, as a matter of fact, almost impotent in the face of the submarine menace. The German Government concentrated early in the war on the development of the submarine and built these vessels in large numbers, with the purpose, as it turned out, of waging a ruthless war on shipping and thereby bringing Great Britain and her Allies to terms. Generally speaking, the German high seas fleet was kept safe at home, while the British grand fleet and other allied heavy naval forces, having no enemy to meet on the high seas, were compelled to wait at their well-protected bases until the German fleet should put to sea. Thus there was little naval activity beyond the submarine warfare waged by the Germans against merchant shipping, and the allied antisubmarine campaign.

The Germans embarked on the policy of sinking merchant ships without warning in December, 1916; and in February, 1917, unrestricted submarine warfare on merchant shipping was formally announced. While the sinking of merchant tonnage had been very considerable up to this time, it rapidly increased until it reached a high point in April, 1917, of 800,000 tons a month. The average for the first six months of that year was 600,000 tons a month, or about 7,000,000 tons a year. It was a plain mathematical deduction that if this condition were permitted to continue, it would assure a victory for the Central Powers within a year, since the diminished merchant fleet of Great Britain and the Allies could not possibly stand the tremendous loss and meet the requirements of transportation necessary to the successful prosecution of the war.

Soon after the United States entered the war, it became a settled policy of our Government to send a large force of troops to reinforce the French and British on the west front. The increasing submarine menace gravely complicated the problem of transporting our troops and their supplies, and every known method of hunting out and destroying submarines was given careful consideration by the Navy Department. Aside from the possible heavy loss of life due to the sinking of American transports by enemy submarines, there was the moral effect of such sinking to be considered; it might react most unfavorably on the morale of the entire American nation and correspondingly cheer the German public.

It became the general policy of the Navy Department to employ every promising means of destroying enemy submarines, and not to be content to rely on any one means to the exclusion of others. The means which proved successful and which were developed, in cooperation with our Allies, to the utmost included the following:

- (a) Arming of merchant vessels with guns manned by naval gun crews.
- (b) Sending vessels in convoys through the danger zones protected by destroyers and other suitable naval vessels.
- (c) "Hunting groups" of vessels of various types equipped with "listening apparatus."
- (d) Aerial patrol by seaplanes and "blimps" armed with depth bombs.
- (e) Arming of destroyers and other suitable craft with an unlimited supply of depth charges.
- (f) Mining of waters habitually traversed by enemy submarines.

The first important antisubmarine plan to give encouraging results was the convoy system, adopted in July, 1917. This plan had the one serious defect of slowing down shipping, since in a convoy of, say, 20 or 30 vessels the speed of the convoy was reduced to that of the slowest ship; but following the adoption of this plan the average loss fell to about 450,000 tons a month. The losses were principally from slow convoys composed of relatively slow-speed cargo vessels. The losses from fast convoys made up of transports and other craft having a speed of more than 12 knots were comparatively small; and the effectiveness of the system was finally demonstrated by the fact that no troop ships in American convoys were lost during the war. However, the loss of 450,000 tons of shipping a month, or even a much smaller loss, would have proved fatal to the Allied cause if permitted to continue; and additional measures were imperatively necessary.

The allied powers were in a very difficult position and were not prepared to quickly put into effect adequate measures against the entirely novel and unexpected form of

submarine warfare instituted by the enemy. So far as the United States was concerned, whatever offensive or defensive measures were decided upon, the procurement of the necessary material therefor would take valuable time. In short, the Navy was not prepared for and could not perform its proper functions until after adequate numbers or quantities, of destroyers; chasers, guns, mines, depth charges, etc., could be built or manufactured.

Taking the case of mines alone, there were on hand in April, 1917, approximately 5,000 mines of a type which was comparatively unsuitable for antisubmarine operations. To show the inadequacy of this supply, it may be stated that the British were using about 7,000 a month and were endeavoring to increase their output to 10,000 a month. Also, the British had found from their own experience that the type of mine possessed by the United States (the Vickers-Elia) was not well suited for the peculiar type of mining in hand and had changed to a new type, a horn mine resembling the German and Russian mines.

Not until after the United States entered the war did the British and other allied Governments furnish us with important military information; but, as soon as we were permitted to avail ourselves of their war experience, the Bureau of Ordnance decided that it would be desirable to provide at least 100,000 mines and that these must be of a type more suitable for antisubmarine operations than any then in existence. In other words, it devolved upon that bureau to develop a new design of mine and to arrange for its manufacture at the rate of approximately 1,000 a day or four and two-tenths times the production that Great Britain had succeeded in reaching. The reasoning leading to this decision is given below at some length.

The Bureau of Ordnance, even before the United States entered the war, had made a close study of the general conditions, particularly with reference to possible measures to be taken to counteract the submarine peril. The mine section of the Bureau of Ordnance, as a result of many conferences on this all-important subject with the chief and assistant chief of bureau and also section chiefs,¹ suggested the measures that could be taken by the United States in a memorandum under date of April 15, 1917, a partial copy of which is appended. This memorandum dwelt upon two principal propositions: First, the protection of merchant vessels by means of cellular construction and "blisters"; and second, antisubmarine barrages enclosing the North Sea and the Adriatic. Obviously, it was impossible to consider seriously any proposition to close German harbors as long as the enemy had complete control of his own waters. The next best thing to "closing the holes" was, of course, to close the North Sea by means of a barrage restricting the operations of enemy submarines to the North Sea and preventing their getting into the Atlantic and interfering with the lines of communication between the United States and Great Britain and France. The proponents of this plan freely admitted that such a barrage probably could not be made completely effective, but insisted that even if it were only partially effective it would win the war.

The memorandum was written mainly with a view to crystallizing opinion within the bureau and furnishing a basis for discussion by officers of the bureau with others concerned in the design and procurement of material for increased naval activities.

Within the Bureau of Ordnance, practically all officers who would be concerned with such a project quite agreed on the principle that the enemy submarine should be contained by means of such a barrage, though the type of barrage and its location were for a considerable period matters of doubt. The consensus of opinion, however, was that the barrage should extend from the east coast of Scotland to the Norwegian coast. This, together with a short barrage across the Dover Straits, would shut off access to the Atlantic, or at least make the continued operations of enemy submarine exceedingly hazardous and unprofitable.

The proposal to construct a barrage 250 miles long was so novel and unprecedented from every practical viewpoint that it was realized at the time that it would be difficult to obtain a prompt decision without considerable preliminary propaganda within the department. Time was regarded as the supreme factor in the situation, as every day saw the loss of many priceless ships and cargoes.

On April 17, the department cabled to Admiral (then Rear Admiral) W. S. Sims, in command of United States naval forces in European waters, directing him to report on the practicability of blockading the German coast efficiently in order to make the ingress and egress of submarines practically impossible. He, in answer, stated that this, of course, had been the object of repeated attempts by the British Navy with all possible means and found unfeasible. Failure to shut in the submarine by a close

¹ At this time, Rear Admiral Ralph Earle, United States Navy, was chief of bureau, Capt. T. A. Kearney, United States Navy, the assistant chief of bureau, and Commander S. P. Fullinwider, United States Navy (retired), the chief of the mines and net section, while Lieut. Commander T. S. Wilkinson, United States Navy, was chief of the experimental section.

blockade using mines, nets, and patrols in the "Bight" and along the Flanders coast attracted attention of the department upon plans for the alternative of restricting the enemy to the North Sea by closing to him the exits through the Channel and the northern end between Scotland and Norway, as proposed by the Bureau of Ordnance. These are outlined in a memorandum of the Office of Operations, dated May 9, 1917, which was to be submitted for the advice and comment of the British Admiralty with its valuable antisubmarine experience. It was noted that, in working up any plan, the whole field of operations was to be considered primarily with a view to attacking the submarine under water as well as on the surface. It was stated that the entrances to the North Sea, while very broad and presenting immense difficulties, came within the bounds of possibility of control. Estimating the cost of gaining this control and confining enemy submarines within the North Sea to be \$200,000,000, or perhaps twice that sum, there was no doubt that the United States would devote whatever amount it was worth if the purpose was to be accomplished. This was proposed to be done by establishing a barrage of nets, anchored mines, and floating mines, to operate from 35 feet to 200 feet below the surface, which, while safe for surface craft, would bar a submerged submarine, while patrols could deal with those running on the surface.

Commenting on this, the Admiralty, who had apparently considered the United States proposals to particularly advocate the extensive use of nets, replied on May 13: "From all experience Admiralty considers project of attempting to close exit to North Sea * * * by method suggested to be quite unpracticable. Project has previously been considered and abandoned. The difficulty will be appreciated when total distance, depths, material, and patrols required and distance from base of operations are considered." It was the British experience that nets failed of their purpose on account of the possibility of cutting them; mine nets, when located, were avoided or run over; all were difficult to maintain in place and required too many patrol vessels to watch. Mine barrages were not considered wholly effective unless maintained by patrols at all points. Considering the use of such a barrage from Norway to Scotland, patrols could not be properly protected on such a long line, because the defense would be stretched out in a long and locally weak line and therefore subject to enemy raids in sufficient force to break through the patrol, cut nets, and sweep mines, and so clear a passage for the submarines. If protected with heavy vessels, these would be exposed to the German policy of attrition with torpedo attack. In short, as concluded by Admiral Sims in his report to the department on May 14, 1917: "Bitter and extensive experience has forced the abandonment of any serious attempt at blockading such passages."

It is noteworthy that the attitude of the British Admiralty and of Admiral Sims was not favorable to the further consideration of the North Sea barrage project; but, notwithstanding this, the proponents of the project, i. e., the officers of the Navy Bureau of Ordnance, redoubled their efforts to secure its adoption, feeling that the result of the war depended upon it more than upon any other possible measure.

From early in March until the latter part of July, 1917, the mine section of the Bureau of Ordnance made an intensive study of many types of barrage, among them the submarine trap and indicator nets which had been used by the British. Most of the plans considered were devised within the bureau; but in addition a very large number of inventions and suggestions from private sources were studied. Unfortunately, practically all inventions or ideas emanating from nonprofessional sources were based on incomplete knowledge of fundamental conditions and requirements. Their shortcomings may be expressed briefly by saying that they were based on mill-pond conditions, whereas the waters in which such a barrage as that under consideration had to be planted and maintained were subject not only to very adverse weather conditions but also to the activities of the enemy naval forces which, up to this time, had displayed great initiative and resourcefulness.

The types of barrage studied were of three principal classes: First, nets and entanglements; second, nets in combination with mines or bombs; and, third, mines alone. The possibility of employing nets or entanglements alone was abandoned early, inasmuch as the war experience of the British indicated that it was exceedingly difficult to plant and maintain nets of sufficient weight and strength to be of any material value, and because the depth of water in which the proposed barrage must be laid was quite prohibitive. The quantity of wire rope required also was prohibitive in the time available.

Nets in combination with mines or bombs were open to the same criticism, with the additional point that such material would be very difficult and dangerous to handle and the planting would be too slow. It was finally decided that mines offered the only practicable solution; and, since no mine then in existence, either in America or abroad, was suitable for the project, mainly owing to the excessive number

required, it became necessary for the bureau to design a mine especially adapted to the purpose. A discussion of the evolution of the mine which was finally adopted will follow. It is only necessary to say here that the novel principle of the firing gear of the new mine was discovered in April, 1917, but was not brought to a state of development warranting its adoption until the latter part of July, 1917.

While from the first the new firing mechanism showed great promise, the officers responsible for its development felt that it would be unwise to place too great reliance on it before it has been thoroughly tested out; and, therefore, studies of other means of forming a barrage were continued without cessation up to the day that the new mine was adopted. As late as July 15, 1917, a memorandum prepared by the mine section was submitted to the Chief of the Bureau of Ordnance suggesting mines in combination with nets. The idea was to have a barrage of overlapping light steel wire nets about 200 feet square, each net carrying two mines, one attached at the top of the net, to be a mine with a hydrostatic firing mechanism, and a second, attached to the center of the net, to have a firing mechanism actuated by a propeller in such manner that a submarine carrying away the net would tow the mine and explode it after a short distance. The hydrostatic mine was intended to explode in the event that the submarine submerged it to a certain depth. It is needless to go into detail regarding the construction of this net and the designs of the mines, since nothing ever came of it. The plan was submitted to a board, but during the board's consideration of the project, information was received of the latest test of the new mine-firing device, which was so favorable that further discussion of the plan before it seemed useless, and the matter was dropped with the understanding that the bureau would concentrate on the development of the new mine, which was thereafter to be known as the Mark VI (up to this time, during its experimental stage, it had been known as the type "X" mine).

In the early days of the mine-barrage project very little official correspondence took place in the matter, principally for the reason that it was desired to keep the matter a profound secret, since it was probable that any type of mine produced would sooner or later bring about methods of counteracting it. It was felt that if information concerning it could be kept until the material had been produced and placed in use, the enemy would not have time to devise protective methods against it.

A decision in the premises favorable to the mine-barrage project was daily becoming more imperative in order to accomplish the laying of the barrage during the best weather of 1918; and, therefore, the bureau had prepared by Commander S. P. Fullinwider, United States Navy, chief of the mines and net section, a second memorandum, dated June 1, 1917, which, bearing a strong favorable indorsement by the Chief of the Naval Bureau of Ordnance, was submitted to the Chief of Naval Operations, this memorandum recommending certain projects for the future conduct of the war and laying particular stress upon the necessity of the northern barrage as being a most promising offensive operation. In fact, the President had addressed the officers of the battle fleet and stated that, as it was nigh impossible to destroy hornets (i. e., German submarines) after they had escaped from their nests, these hornets must be confined to their nests or destroyed before reaching the vast wastes of the ocean.

Realizing that it is difficult to obtain quick action on a novel scheme of such magnitude as the one under discussion, and especially in view of the unfavorable attitude shown by the British, the chief of the mine section, as a representative of the bureau, departed from the policy of secrecy to the extent of discussing the as yet indefinite plan with several officers who were in a position to further the scheme, notably with a member of the General Board, with an officer close to the President, and with representatives of the Office of Naval Operations. He also discussed the matter with Commander C. D. C. Bridge, a British officer then officially visiting this country, who was shortly to return to London. While the type of mine to be used had not yet been developed, it was important to see to it that the idea of a northern barrage should be accepted as a sound and indispensable measure to defeat the enemy submarine. The Bureau of Ordnance, from the first, took the attitude that if the idea of such a barrage were only adopted, the project would be carried through in some way or other, as the only question then would be merely a choice of methods and material; and the bureau had no doubt that the material question could be solved in a satisfactory manner. It may be added that the measures above referred to bore fruit, since the project was adopted by the Navy Department without much loss of time after the Bureau of Ordnance reported that a suitable mine had been developed. Furthermore, the President's attitude was known in advance to be favorable, and the project, when adopted by the department, was promptly approved by him.

One of the earliest and most enthusiastic proponents of the northern barrage project was Assistant Secretary of the Navy, Franklin D. Roosevelt, to whom was given a copy of the memorandum of April 15, 1917, and with whom the matter was discussed

a general way. The Assistant Secretary's keen interest in the matter was very apparent throughout the early phases of the project; and it is understood that he took up with the Bureau of Yards and Docks the problem of a net barrage across the North Sea. While the details of this study are not known, it is assumed that effort along that line was stopped when it became known that the Bureau of Ordnance had a suitable type of mine, which, of course, was readily accepted as far preferable to any net plan.

In the month of May, 1917, the Department of Commerce became interested in a barrage proposed by certain officers of the Coast and Geodetic Survey; and the Secretary of Commerce took up the matter with the Navy Department and strongly urged that the two departments collaborate in designing and putting down such a barrage. It is needless to go into details regarding its design, and the mere statement will suffice that it was to be composed of nets in combination with mines, and that the net was composed in part of insulated wire, the breaking of which wire by a submarine would fire a mine. There were several conferences, one of them presided over by the Secretary of Commerce and attended by Assistant Secretary Roosevelt, Commander Fullinwider, and Lieut. Commander Castle. The Bureau of Commerce was not favorably disposed towards this plan, because it felt that, even if the necessary quantity of material could be obtained, which was doubtful, it would be a very difficult project to carry into execution, and furthermore, that it would be quite impossible to maintain it in waters such as the North Sea. Plans were adopted to carry out tests in deep water, but interest in this plan ceased when Mr. Roosevelt became convinced that the Bureau of Ordnance had developed a satisfactory mine for a barrage.

The foregoing is mentioned only to show the active and growing interest at that time in the idea of a barrage. It also became a favorite problem with inventors. In short, by the time the bureau had demonstrated to its satisfaction that the new mine would be effective, the closing of the North Sea was quite recognized in America as the best possible solution of the antisubmarine problem. It remained to convert the British naval authorities to this view.

The adoption of any plan for a barrage to close the North Sea was, of course, dependent upon the suitability and availability of the material, and so the development of the project was largely the development of the Mark VI mine. It should be stated in this connection, however, that the northern barrage would undoubtedly have been realized whether or not the Mark VI mine had been adopted for the purpose. There were other designs of mine available, but the Mark VI was deemed the most promising in sight at that time.

In April, 1917, Mr. Ralph C. Browne, a citizen of Salem, Mass., an inventor associated with the L. E. Knott Apparatus Co., Cambridge, Mass., brought to the department a description of an invention which he called the "Browne submerged gun." Assistant Secretary Roosevelt referred him to the Bureau of Ordnance, and the invention was duly considered by the chief of bureau and Commander Fullinwider and Lieut. Commander T. S. Wilkinson. The invention in the form offered may be briefly described as follows: A buoy or float carried, as an integral part, a so-called gun or short tube extending vertically downward. The buoy carried also a copper wire hanging vertically. A high-explosive shell was carried in the tube or gun. This shell contained in its base a propelling charge of slow-burning powder intended to give the projectile a velocity of about 50 feet per second through the water. The shell was provided with guides to restrict it to travel along the wire. The float carried also an electrical relay mechanism, all parts so related that the contact of a submarine or any steel vessel with the pendent wire would produce a sea-battery current of sufficient energy to actuate the electric relay, which in turn would ignite the propulsive charge in the base of the shell and send the shell along the wire into contact with the submarine, where the shell was expected to burst and rupture the hull. The design was very ingenious and novel as a whole; but in its then proposed form it was deemed by the bureau to be wholly impracticable for naval use. Commander Fullinwider saw, however, that the electric principle involved might be applied to a mine-firing device, and after making a study of the matter with Capt. S. J. Brown (Math.), United States Navy, and Lieut. Commander Wilkinson, and after reference of such study to the chief of bureau, he suggested to Mr. Browne that he collaborate with the bureau in applying the new principle to an antenna mine. This Mr. Browne was loath to do, as he felt that his invention would be more effective than would a mine. After about two weeks' investigation, including considerable pressure by the chief of bureau himself, however, Mr. Browne agreed that he would defer to the bureau's judgment in the matter and consented to collaborate with the bureau in the development of a mine-firing device based on the use of a sea battery.

Mr. Browne immediately took up the work, and on June 18, 1917, a crude model of a mine-firing device was tested with promising results at the submarine base, New

London, Conn. Further tests were held on July 10; these tests were conducted by the experimental officer of the bureau. It was immediately subsequent to these tests that it was finally decided to adopt the new firing device, and the bureau proceeded to design and develop a mine in which this device could be used.

The bureau was convinced by the tests that the device, which was thereafter to be called the K-1 device, was correct in principle, but realized that in the short time available for development and experimentation, it could hardly be hoped to obtain reliability in the mechanical features of the design. However, since it was essential that mines for the barrage should be ready in large quantities by the following spring, it was decided to proceed with the manufacture of the devices and trust to making any necessary modifications after getting into production, and in the meantime to proceed with tests, so far as tests could be conducted without complete mines.

It may be stated here that, although the design of the complete mine had not yet been decided upon and could not be completed for several months, the mine section of the Bureau of Ordnance was sufficiently assured of the successful development of the mine to submit tentative plans to the chief of bureau, and he took the responsibility of formally committing the bureau to this method of closing the North Sea.

On July 18, 1917, the bureau addressed the following letter to the Chief of Naval Operations announcing the development of a new type of mine-firing gear which would be suitable for mines for a northern barrage:

Confidential.

JULY 18, 1917.

To: Chief of Naval Operations.

Subject: Submarine mine barriers, material for.

1. The bureau has developed a new type of mine, at present referred to as Mark VI (Type X) which it is confidently believed will facilitate the establishment of submarine barriers. The mine is radically different from other mines in its firing gear, which has been tested out with excellent results, and the bureau is now proceeding with the design of the mine as a whole and expects to complete it within two weeks.

2. The new mine will be as easily planted as the ordinary types of naval defense mines, and therefore the time and the number of vessels required to establish a barrier will be reduced to a minimum. This mine can be rigged so as to be safe as regards surface vessels, but effective against craft operating below the surface.

3. The mine will be comparatively simple in design, and it is believed that it can be manufactured at a minimum rate of 1,000 per day, which means that the number required for about 300 miles of barrier can be produced within about three months from the beginning of deliveries or within four months from the placing of orders.

4. The bureau requests that a decision be reached at the earliest practicable moment as to the desirability of establishing complete barriers to prevent enemy submarines from gaining access to the Atlantic. The bureau assumes that such a project is desirable, as no other means of stopping the submarine peril appears to be in prospect, and, since it is going to take four months to obtain the necessary material, the bureau believes that it should be authorized to proceed immediately with arrangements for procuring the material.

5. Theoretically, only 72,000 mines will be required for 300 miles of barrier, but 100,000 should be provided to allow a reasonable excess for replacements, etc. In addition, a number, say 25,000, should be provided for our own coast defenses, it is believed, making a total of 125,000 mines, which, at an estimated cost of \$320 each, gives a total cost of \$40,000,000. This estimate is designedly liberal.

6. The bureau is of the opinion that the design, manufacture, and assembly of the new mine should be carried out with the utmost secrecy, and is taking the necessary precautions accordingly, since advance information of such a mine would be of the greatest aid to the enemy in devising means to counteract it.

7. The above estimate as to time is based upon our success in securing the necessary quantity of T. N. T. or other high explosive.

8. In considering this project the use of high-speed mine-laying vessels such as liners and merchantmen in addition to destroyers and light cruisers will be required, and such vessels must be provided. The mines can be dropped accurately at any speed by time devices. The whole barrier should be laid as one operation and be protected as far as possible. If isolated mines are planted it is probable that a device to defeat the mine-firing mechanism will be developed by Germany.

RALPH EARLE.

While awaiting the department's action, the bureau proceeded with the design of the mine, with a view to being prepared at the earliest possible date to undertake its manufacture.

On July 30, 1917, the bureau addressed a second communication to the Chief of Naval Operations, submitting more complete information regarding the new mine and

proposing an American-British joint offensive operation in the form of a northern barrage. A copy of this letter follows:

JULY 30, 1917.

To: Chief of Naval Operations.

Subject: Proposed British-American joint offensive operations; submarine barriers; Mark VI mines.

1. In its letter No. 32957 of July 18, 1917, the bureau announced the development of a new type of mine that is peculiarly adaptable for use against submarines.

2. The firing mechanism of this mine is based on a very recent discovery in the electrical field and, although there has been little time for development, the tests which have been carried out with an experimental mine by a submarine leaves no doubt, in the bureau's opinion, of the success of this invention.

3. The mine will have the following characteristics:

a. A spherical mine case carrying a charge of 300 pounds of T. N. T. having a destructive radius of about 100 feet against a submarine.

b. The anchor may be either the automatic type such as that now in use or a simple mushroom type, depending upon the conditions under which mining operations shall be carried out.

c. The firing mechanism comprises an electrical device carried within the mine case and an antenna of any desired length, the end of which will be supported by a small buoy as near the surface of the water as may be desired. A second antenna may be suspended from the mine where the depth of water renders this necessary.

d. A steel vessel coming in contact with the antenna will fire the mine.

4. The mine has the following advantages over other types:

a. In depths of less than 100 feet, it may be planted on the bottom where it is least affected by wave action and current. In this case a buoyant mine is not necessary or desirable and it can be made smaller and cheaper than a buoyant mine. In such circumstances there is no possibility of its getting adrift and it can not be swept up in the usual way. It can, however, be fired by a mine sweep.

b. In depths greater than 100 feet, it is proposed to submerge the mine to a depth of 100 feet since 100 feet is about its destructive range against submarines. At this depth the mine itself is entirely protected from wave action and only the light float or buoy is exposed to such action.

c. Where conditions permit, the antenna may take the form of a net; or the antenna of adjacent mines may be connected by horizontal wires forming an impassable barrier.

d. If a floating mine be desired, this mine may be suspended from a buoy in such manner as to be harmless to surface craft but deadly to submarines submerged.

e. It may be used as a towing mine with antenna to give it a very large danger space.

f. It can almost entirely replace submarine nets of present types.

g. It can be used for mining very deep water more easily than can other types.

5. The mine, with its anchor, antenna, and buoy will be assembled and launched as a unit, so that it can be launched at high speed from destroyers if desired.

6. The bureau believes that with this mine it becomes practicable to close the North Sea, Adriatic, and other exits of enemy submarines, and that it gives us our opportunity to cooperate in carrying into execution a major offensive operation of a decisive character. Even if the proposed barriers should prove to be only 50 per cent effective the enemy's submarine campaign would surely fail.

7. It is suggested that the North Sea barriers must extend from the coast of Scotland to Norway and across the English Channel. The proposed line from Scotland to Norway must, to be all effective, extend into the territorial waters of Norway, thereby involving the question of Norway's neutrality. It would seem that if the German submarine is permitted by Norway to use her territorial waters, it becomes incumbent upon the Allies to take measures to prevent such use.

8. The proposed mine barrier scheme does not infringe upon the neutrality of Holland, Denmark and Sweden, except in the restricted sense that the vessels of those powers, as well as of Norway, would be required to pass through a gate in the barriers under the control of the allied forces. In effect, this would amount to the establishment of additional danger zones to be avoided by neutrals.

9. The bureau understands that the British Admiralty has objected to any barrier in the North Sea that would interfere with the freedom of the British Fleet. It is suggested that a gate should be left in the barrier at an appropriate place near the Scotch coast, not only for British naval vessels, but also for neutral merchant vessels. This gate would be, say, 8 miles long, with mines so planted that their antennae would not come within 40 feet of the surface at low water. In other words, the subsurface would be mined against submarines and the surface left open. This gate could be

effectively patrolled with a very few vessels and submarines attempting to pass on the surface could be destroyed.

10. If a decision should be reached immediately to proceed with the assembling of the material for these barriers, it would require approximately six weeks to complete the designs, place the orders and start production on a large scale. After starting production mines could be obtained at a minimum rate of 5,000 a week, and if the project were given the importance due it, there is no doubt that the manufacturers could be depended upon to increase this figure. In this connection, it is assumed that the British Admiralty would be willing to cooperate to the extent of furnishing a portion, at least, of the mine anchors, but it is believed that we should supply all of the mines, with the exception of the anchors.

11. It would require approximately 72,000 mines to establish barriers around the North Sea, assuming that the barrier will be composed of four lines of mines, placed 100 feet apart in each line; in other words, a barrier would require a mine for every 25 feet. To this 72,000 should be added at least 28,000 for renewals and as a reserve. If it should be decided to place the barrier across the Adriatic and to close the Dardanelles about 50 miles of barrier, or about 15,000 additional mines would be required.

12. It is estimated that 125,000 mines can be manufactured at a cost of \$40,000,000.

13. The bureau has made every effort to keep the discovery and development of this mine a military secret, and it is believed that this secrecy can be maintained by proper organization and administration until such time as it becomes necessary to assemble the completed mines to ship them to Europe. To this end, the various parts of the mine will be manufactured by different companies and no manufacturer need be informed as to the characteristics of the mine as a whole. The company which will manufacture the firing gear has taken such precautions that only three members of the company will know that the electrical apparatus used in the mine is intended for a mine.

14. In view of the importance of keeping this matter a military secret, it is considered desirable that the British Admiralty should not be informed as to the features of the mine until the mines shall have been manufactured and shipped. This view is taken because it is inevitable that information will leak out regarding the design if any considerable number of persons should become informed of it, and since it is proposed to manufacture the mines complete in this country, it would seem unnecessary to send any information regarding it abroad and would only invite the possibility of such a leak.

15. If the enemy should learn of this invention it would be easy for him to evolve a similar mine, which he could use to blockade the British ports. The principle of the firing mechanism is so simple that only the slightest clue would enable the enemy to duplicate it.

16. If this project should be carried out, the bureau is of the opinion that its execution will bring about a general engagement with the German fleet, which it is supposed is desirable.

17. The following is a summary of the cooperation deemed necessary to carry out this plan:

United States:

- (a) Provide mines, except anchors.
- (b) Send mines to England.
- (c) Assist in assembling mines in England.
- (d) Provide a number of mine layers.
- (e) Assist in laying.

Great Britain:

- (a) Provide anchors.
- (b) Assemble mines on anchors.
- (c) Organize and equip mine-laying force.
- (d) Lay all mines with United States assistance.

18. In the above it is suggested that Great Britain provide the anchors, for the reason that about 30,000 tons would be required and that the transportation of this tonnage should be avoided if possible.

19. Regarding the mine-laying part of this project it is understood that Great Britain has about 18 regular mine layers and that the United States could probably furnish 4, giving a total of 22, not including destroyers. A number of British destroyers are fitted to carry 80 mines and probably some of ours could readily be fitted to carry 40 to 80 each, so it is assumed that 40 destroyers may be available. The mine-laying program may then be assumed to be approximately as follows:

- (a) Twenty-two mine layers could lay 200 mines per day each. If they take one day to reload, they would lay an average of 100 per day each.
- (b) Forty destroyers could average 50 per day each.

- 19. All combined could lay 4,200 per day.
- 20. For the northern barrier about 60,000 mines are required. These, at the rate of 200 per day, could be laid in about 15 days.
- 21. For the English Channel barriers assumed lengths 50 miles, 12,000 mines would be required. At the rate of 4,200 per day, these could be laid in three days. It is assumed that two barriers each 25 miles long would be required in the channel to fully protect the channel crossing.
- 22. Lacking definite information as to the mine-laying facilities in the Mediterranean, but assuming that 10 vessels could be made available, the Adriatic barrier, 100 miles, could be laid in about one week, and the Dardenelles barrier in a shorter time.
- 23. As the manufacture and assembling of the material will be an immense undertaking, and as time is precious at this juncture in the war, a decision should be reached at the earliest moment practicable.
- 24. If this plan be adopted, it will be necessary to expedite manufacture by giving it work priority over certain other Government work, particularly in the matter of obtaining a sufficient supply of T. N. T. This will be made the subject of special report if the general plan be adopted.

KEARNEY, Acting.

On August 15, 1917, Admiral Mayo, commander in chief Atlantic Fleet, who was about to proceed to England accompanied by certain members of his staff, conferred with the chief of bureau and officers of the mine section regarding the new mine and its value for the proposed northern barrage. This discussion covered not only the material questions but also matters of strategy and tactics involved in such an undertaking. The bureau furnished Admiral Mayo for his information and for use in discussing the matter with the British naval authorities a memorandum embodying the ideas of the Bureau of Ordnance concerning the adaptability of the Mark VI mine for a barrage. This memorandum is quoted below for the reason that it set forth with fair accuracy the possibilities and limitations involved in the use of the new mine and, in connection with the above quoted letters to the Chief of Naval Operations, supplied the information necessary for an intelligent consideration of the northern barrage project.

Confidential.

AUGUST 15, 1917.

Memorandum for commander in chief Atlantic Fleet.

Subject: Mark VI mine.

Enclosure: (A) Copy of Bureau of Ordnance letter to Chief of Naval Operations, dated July 30, 1917.

1. The following notes are intended to amplify and supplement the information contained in the inclosed letter.
2. From the early stages of submarine warfare, trap nets have been used to a considerable extent, but it has been found to be extremely difficult to maintain nets of sufficient weight and strength to stop submarines, and it has lately become known that submarines are equipped with cutters which enable them to cut their way through. Inasmuch as the submarine is free to go to a depth of 200 feet, a heavy trap net in deep water necessarily becomes a serious problem, not only to manufacture and plant, but also to maintain against the wear and tear due to storms and currents, etc. The bureau early became convinced that a trap net designed to offer passive resistance to submarines is not a sure solution to the problem.
3. Indicator nets of various designs have been studied and much information regarding foreign types of such nets have been fully considered with the conclusion that this type of net also is not a satisfactory antisubmarine device. Such nets must be suspended from surface floats and cables, are subjected to extreme conditions of wear and have a short life. But the principal objection to such a net, when it is not combined with bombs or mines, is that it merely indicates the presence of a submarine and that it requires a very large number of patrol vessels to keep a close watch on the net in order that a vessel may be near at hand to destroy a submarine whose presence is indicated. With a view to reducing the number of attendant vessels, a radio buoy has been developed to send out a call automatically in the event of a submarine pulling an indicator net, but the defect of this scheme is principally that a submarine has an excellent chance to get clear of such a net by the time a patrol vessel could arrive on the scene.
4. Nets in combination with mines or bombs are better, on paper at least, than either the trap nets or the indicator nets; but here again the difficulty of planting and maintaining such nets on a large scale—for example, the proposed North Sea barrier—would be prohibitive. The bureau has examined and carefully considered hundreds of inventions and suggestions relative to nets of all descriptions, and has come to the

forces. This would then insure the maintenance of an adequate and continuous patrol and the prevention of sweeping operations.

22. In planning for the material required for the North Sea barrier, the line from Buchan Ness, on the east coast of Scotland, to the coast of Norway was assumed as a possible line. This line is an extreme example of a barrier because of its length and the depth of water traversed, though its currents are favorable.

23. It is evident that such a barrier would restrict freedom of action of the British fleet based on the coast of Scotland, inasmuch as it would not be free to cross the barrier line at any point except where a "gate" had been established. This gate could be any width desired, say 15 or 20 miles, and there could be more than one gate.

24. Assuming that the North Sea was inclosed by effective barriers and assuming that the enemy had 200 submarines in the North Sea and confined thereto, it is to be expected that the enemy would attempt to trap the allied forces. For example, suppose that a gate 20 miles wide were left in the barrier, near the coast of Scotland, and that this was the only means by which the allied fleet could pass in and out of the North Sea. It is to be expected that the enemy might dispose his submarines in appropriate positions in the neighborhood of such gate, that he would then send his main fleet into the North Sea to make a demonstration and try to draw the British and allied forces into an ambush. The important question arises, therefore, as to whether the British and allied fleets could reasonably expect to cope with such a situation. It seems reasonable to expect that by means of patrols and sweepers a large area of sea adjacent to the proposed gate could be kept under control and made fairly safe for the fleet. However, denial to the German submarines of access to the Atlantic would intensify submarine activities in the North Sea. The enemy would also be likely to attempt to raid and sweep or destroy parts of the barrier. This would necessitate constant and vigilant patrol by fast light cruisers and destroyers, and it is to be expected that this condition would bring on heavy engagements with the enemy, if not a main fleet action.

* * * * *

27. Further tests are about to be made of a number of mines to demonstrate their reliability under varying conditions of service, and their safety in handling, but as the firing gear is the only really novel feature of the mines, and as that has stood every test yet applied to it, there appears to be no possibility of failure.

28. The manufacture of 10,000 mines for our own service has been started. This initial lot of 10,000 will prepare manufacturers concerned for production of larger quantities.

T. A. KEARNEY, *Acting*.

As will be subsequently seen, the tentative design of the mine had to be modified as a result of experiments and more mature study of the project. Notably, the use of a lower antenna was decided to be impracticable or inadvisable; and the spacing of mines had to be increased to 300 feet to reduce the danger of countermining. It was found, too, that the Bureau of Ordnance had been too optimistic in its forecasts relative to early completion of design and early production, due principally to the lack of sufficient experienced personnel in the early stages of the project.

The foregoing carries the history of the northern barrage to the point of its formal submission to the British Admiralty by the Navy Department through Admiral Mayo.

CHAPTER II.—BRITISH CONSIDERATION OF PROJECT.

A British Admiralty "History of northern barrage" states that:

"Toward the end of August, 1917, Commander (Acting Captain) Alan M. Yeats-Brown, D. S. O., R. N., after having made various proposals during the preceding two months with regard to antisubmarine measures, produced a paper entitled 'Antisubmarine mining proposals.' This paper was referred to the plans division. This division had already been considering these matters for some time, and, after consulting with Capt. Yeats-Brown on several points which he had brought forward, suggested certain modifications to the proposals and wrote an appreciation on Capt. Yeats-Brown's paper. The conclusions arrived at were brought up for discussion at the next allied naval conference by the first sea lord, who, it is believed, had previously discussed the matter with Admiral Mayo, of United States Navy."

The northern barrage project was taken up at an allied naval conference, at London, September 4-5, 1917, attended by Admiral H. T. Mayo, United States Navy, where, as reported by him on September 8: "The British Admiralty put forward, as an alternative to a close offensive in German waters, the suggestion that the activity of enemy submarines might be restricted by the laying of an effective mine field or mine net

barrage." The mine net barrage was considered impracticable, and "as to the proposal to put down a mine barrage in the northern part of the North Sea, while it could be guarded against enemy sweepers, certain difficulties exist, such as lack of freedom of movement of the Grand Fleet, so that a very promising degree of success should be indicated before such an undertaking was begun." Further, "The conference, after discussion, agreed that the distant mine barrage could not very well be undertaken until an adequate supply of mines of satisfactory type was assured."

The British Admiralty history, in reference to the proceedings at this conference states:

Admiral Jellicoe put forward the suggestion of laying 'an efficient barrage so as to completely shut in the North Sea.'

He computed that 100,000 mines would be required. He remarked (a) "I do not think we get many German submarines by mines;" (b) "It appears that the result of our mine fields (in the Bight) is to force the submarines, or a very large proportion, to go in and out of the German bases through territorial waters or Dutch territorial waters;" (c) "There is the alternative of laying a mine field in the North Sea, in a position where the enemy sweepers can not reach without running very considerable risk. In view of our present experience, I do not think that would have much more result than our present policy; but if a mine is produced which is more effective against submarines than our own mines, the matter, perhaps, becomes somewhat different. * * * We get our mines slowly. Our problem is then: Is it better to put them down as we get them, or is it better to wait until we get a very large number and lay a complete barrage across the North Sea? * * * It is obvious a mine field so laid would have to be at some considerable distance from German ports, because it would require to be watched. * * * A great deal depends upon whether the mine is a satisfactory one. If we get a satisfactory mine, it might be worth while laying a barrage when we get a sufficient number."

Admiral Mayo approved the idea of a mine barrage involving patrol by the allied fleet, provided always that we had confidence in the efficiency of the mine which would be laid. He thought that this promised really more in the way of results than the proposed operations in regard to the convoy of ships.

Vice Admiral Sims said: "It must be successful completely, or it is not successful at all. Either the barrage is successful absolutely or it fails absolutely."

Sir Eric Geddes said: "I do not understand from the remarks of the first sea lord that the barrage should take the place of other offensive measures. It is not considered that the barrage can be sufficiently relied upon to take the place entirely of other measures for hunting and destroying submarines."

As for Sir Eric Geddes's statement, he was in exact accord with the American proponents of the project, who from the first advocated it in addition to other useful antisubmarine measures.

The results of the conference may be summed up as indicating a favorable attitude, in principle, toward the Northern barrage project leavened with doubt of its practicability. The reasons for this doubt are surmised to have been the generally unfortunate experience of the British in the development and use of mines. At the outbreak of war in 1914 the British had practically no mines, and, for want of a better one, adopted the Vickers-Elia type, which soon proved unreliable and ineffective. This was superseded by one of British Admiralty design, essentially similar to the Russian and German horn mines, but with a distinctly British sinker (anchor). This British horn mine, while perhaps an improvement on the Vickers-Elia, was not entirely satisfactory, being comparatively dangerous to handle, too susceptible to countermining, unreliable in automatic depth taking, and not of a type lending itself to rapid and economical manufacture.

For some reason, perhaps their own rather slow and unsatisfactory progress in the development of mines, British officials apparently were skeptical of the ability of the United States to produce quickly a more satisfactory type. This attitude first became apparent to the Bureau of Ordnance on June 2, 1917, when Admiral Sims in a dispatch to the department reported: "* * * the British Admiralty have concentrated upon the construction of mines to such extent that they now anticipate that by August the output will reach 10,000 a month. They consider it unwise from their previous experience with mines similar to those which we now have on hand to attempt to utilize our present available supply. They now consider * * * as our output of a different type mine would not be available in sufficient time that we can more profitably concentrate on other work."

An immediate result of the conference was the production on September 14, 1917, by the Admiralty plans division of a paper for Admiral Mayo, entitled "General future policy, including future mining policy," with an appendix, "Mine barrage across the North Sea." The following extracts from this paper bearing on the barrage project are quoted:

"The enemy submarine campaign now dominates and overshadows every other consideration, and any increase in the present rate of sinking might bring about an unsatisfactory peace.

"* * * It therefore appears that our future policy must be directed toward a more concentrated and effective control in the areas between the enemy's ports and our trade routes.

"Some form of barrage corresponding to that which was formerly established by the battle fleet * * * must be reconstituted in such a form that the enemy submarines can not venture into it without considerable risk to themselves.

"Broadly speaking, four forms of barrage may be considered:

"Firstly. A barrage of mines only * * *.

"Secondly. A combination of deep mines with surface and aircraft.

"Thirdly. Surface and aircraft patrolling a wide belt.

"Fourthly. Sealing the submarine exits * * *.

"The fourth form of barrage * * * is the only radical cure * * * but the difficulties * * * are so great that it is not recommended to attempt it.

"It is therefore proposed to use a combination of the first three.

"* * * The enemy submarine would thus be subject when on the surface to attack of one kind or another from shortly after leaving their bases until they cleared the Orkney-Shetland-Norway line, in addition to passing through a mine barrage. * * *"

The paper also dealt with the protection of the barrage, remarking, "* * * with our fleet based on Rosyth, we should be in a position to insure protection even to the area between the notified area and the Norwegian coast."

The use of neutral waters by enemy submarines was also dealt with: "* * *. This can only be overcome by converting the neutral into an ally or by ourselves preventing the enemy submarines from using these waters. * * * Should Norway come in on our side, Stavanger * * * could be used as a base for a fleet or for the light watching forces as desired. Should, however, the general situation render it undesirable to include Norway among the Allies, any development of the selective type mine would enable us to deal with the passage. * * *."

The appendix dealt with the details of the mine barrage, which it was proposed to establish on the Aberdeen-Ekersund line and was at that time of such importance to the further consideration of the project, particularly to the Navy Department, that it is quoted in full below:

APPENDIX I.—MINE BARRAGE ACROSS THE NORTH SEA.

The object of mining the North Sea is to prevent the enemy submarines from getting out, but it is most undesirable that any mine barrage should hinder the movements of our own fleet or lay our coasts open to attack, if it can be avoided.

Before considering the line to be selected, the requirements of an effective mine barrage will be considered.

The requirements are as follows:

(1) The mine field must be guarded; that is to say, it must either be—

(a) At such a distance from the enemy ports that he can not sweep it; or,

(b) We must watch it and drive off any sweeping vessels he sends out.

Obviously (a) is preferable. It is also an advantage to be far enough off the enemy aircraft bases to prevent interference to our patrols by seaplanes or aeroplanes. Zeppelins can be dealt with.

(2) The mine field should be as far from the enemy ports as other considerations will permit to enable our patrols to intercept any submarine damaged but not sunk outright by our mines.

(3) The barrage must consist of both deep mines and mines near the surface; or, if deep mines only are used, the barrage must be patrolled in order to force the submarine to dive to the level of the deep mines.

It is also an advantage if the barrage is in such a position that our main fleet can be based on the enemy side of it, as this will not only give freedom of movement to our own fleet, but in addition should enable us to intercept any enemy vessels which endeavor to interfere with our barrage or the vessels patrolling it.

Consideration of the line to be selected.—The line from Aberdeen to Norway is preferred for the following reasons:

(a) Its great distance from the enemy ports, which will render interference from the enemy difficult. Thus, every mine laid in this area will continue to be a menace to the enemy submarines until the end of the war.

(b) The line is shorter than any other, with the exception of the Orkney and Shetland-Norway line, which is considered impracticable owing to the depth of water and the strong tides in the Firth of Clyde Channel.

- The grand fleet, if based on Rosyth, is on the enemy side of the line.
- f. Any submarines damaged by mines will have a long way to get home and should be accounted for by our patrols.
- g. Whether Norway eventually comes in on the side of the Allies or not, the eastern end of the line will be far easier to guard than the northern end of the Goodwin-Hatland line, which has been suggested.
- h. It would be easier to bring pressure to bear on Norway to induce them to take steps to prevent submarines passing through their territorial waters than it would in the case of Denmark with their ever-present fear of invasion.
- i. The line Aberdeen-Norway deals with submarines using the Baltic exits as well as with those coming from North Sea ports.

Proposed mining policy.—The principles governing our policy to be:

- a. Never lay a mine which can be swept in such a position that the enemy can sweep it.
- b. Lay mines which can not be swept as close off the entrance to the enemy harbors as possible.

The practical application of this policy to take the following form:

1. Mine the Straits of Dover with deep mines and patrol the minefield to force the submarines down on to the mines.
2. Prescribe a mined area on the Aberdeen-Norway line.
3. Lay deep mines between the notified area and Aberdeen and patrol this line so as to force the submarines down.
4. Lay deep mines between the prescribed area and Norway when mines become available; in the meantime this area to be watched by hydrophone vessels.
5. Mine close to in the German harbors with destructor mines.

The British Navy to be responsible for mining the Straits of Dover and the entrances to the German rivers.

The American and British Navies to cooperate in mining the Aberdeen-Norway route.

It is absolutely essential that the whole of the mines laid in the Aberdeen-Norway barrage should be so constructed that they automatically become safe should they break away from their moorings.

Details of the Aberdeen-Norway mine barrage.—Reference: Chart No. 2182 B.

1. The total length of the barrage may be taken as 280 miles over the greater part of which the depth of water is less than 50 fathoms.

To mine any belt of water effectively there should be 3 lines of mines at each depth of 5 fathoms (e. g. the vertical distance between lines of mines will be 30 feet).

One line of mines at each depth will be referred to as a "system." Thus the complete barrage will consist of three systems.

It is not considered necessary, however, to lay mines at a greater depth than 200 feet (33 fathoms), as submarines will not willingly go below this depth.

2. The barrage is divided into three parts:

Area A, the Notified Area: This area has to be made dangerous from the surface to 200 feet below it.

Area A, B, and C: Deep mines with surface vessels and aircraft patrolling.

The above areas will be considered separately.

3. Area A: It is necessary to make this area impassible to submarines, whether diving or on the surface. Three systems of mines will be required. If British mines are used, each system will have lines of mines at seven different depths, whereas if American mines are used, each system will only require lines of mines at two different depths.

It is therefore proposed that American mines should be used for the area.

The barrage will consist of three systems of lines each, e. g., six lines of mines in all.

Suggested method of laying the mines.—(a) The northern edge of area A would be mined first in order to restrict the movements of our fleet to the southward as little as possible.

(b) The depth of area A is 56 miles, which will allow of the mine field being extended in a southerly direction without a further notification to neutrals.

(c) It is of great importance, however, to absorb as little of this space as possible on each occasion of laying mines, and for this purpose three lines of spar buoys will be laid in area A, as shown on Chart 2182 B.

(d) Only one line of buoys will be required for laying the first and second systems, the third system being laid to the north of the center line of buoys. The presence of three lines of buoys will confuse the enemy as to the actual position of the mines.

(e) The spar buoys will be laid at intervals of 10 miles and will be numbered so that the mine layers can ascertain where to commence laying on each occasion.

(f) The operation of laying the mines might be carried out as follows:
Two mine layers to proceed to No. 2 buoy and lay lines A1, A2, as shown on chart. These lines would form part of the first system. The lines A1 and A2 would be 11 miles in length, the first mine being dropped when 2 miles from No. 2 buoy.

NOTE.—The object in not laying mines until 2 miles away from the buoy is twofold:
(1) It enables the buoys to be approached if it is desired to remove them later on.
(2) The buoys will give no information as to the exact position of the ends of the lines of mines.

On the next occasion the mine layers would proceed well to the eastward of No. 2 buoy, then steer south until they reached the line of buoys, shape course for No. 3 buoy and lay lines A 1, A 2.

The second system of mines (lines A 3, A 4) would be laid in a similar manner, but to the southward of the line of buoys.

Number of American mines required.—It is assumed mines will be laid 40 yards apart.

First system=length of the line by number of lines \times number of mines to the mile.
 $= (11 \times 11) \times 2 \times 50 = 12,100$.

Complete barrage=3 systems=3 \times 12,100=36,300.

4. Area B: The barrage will consist of three systems. Each system will have a line of mines at each of the five following depths:

65, 95, 125, 155, 185 feet.

It is proposed that the mining of this area should be undertaken by the British. Each system will require 22,500 mines.

Therefore complete barrage=3 systems=67,500 mines.

5. Area C: It is desirable that American mines should be used for this area as the number of sinkers required is thereby reduced considerably. A decision on this point can only be arrived at when it is known what type of sinker can be used with the American mine.

Numbers required.

If American mines are used:

Complete barrage=3 systems=3 \times 2 lines=6 lines.

Number of mines in each system=length of line by number of lines by number of mines to the mile.
 $= 60 \times 2 \times 50 = 6,000$.

Complete barrage=3 systems=3 \times 6,000=18,000.

If British mines are used:

Complete barrage=3 systems=3 \times 5 lines=15 lines.

Number of mines in each system=60 \times 5 \times 50=15,000.

Complete barrage=45,000.

NOTE.—This number would be considerably reduced if the X attachment is used.

The copy of the above-quoted Appendix I, which was given to Admiral Mayo for the Navy Department, bore the following notation on its face: "Admiralty would be glad to learn whether Navy Department concurs in the plans as shown."

The Admiralty "History of northern barrage" states that "As a result of this paper it was decided to proceed with preparations for laying a barrage on the Aberdeen-Norway line," and adds that "The date of this decision is not known."

It is important to note that at this period the British Admiralty was apparently quite in accord with the Navy Department in regard to major features of the project, but differed with respect to some of the details. Pending the return of Admiral Mayo to the United States about the middle of October, the development of the project was almost at a standstill for want of information as to British intentions, except in the matter of design and manufacture of the new mines; but the British Admiralty proceeded with the formulation of policies and plans based on the decision to lay the barrage on the Aberdeen-Norway line. These activities will be referred to in detail later.

The location of the proposed barrage, with the proposed area which should be notified (as it was to contain surface mines as well as deep mines), together with the suggested arrangement of the mine systems, is shown in the reproduced chart (fig. 4).

CHAPTER III.—AMERICAN CONSIDERATION AND ADOPTION OF PROJECT.

Upon the return of Admiral Mayo to the United States, a conference was held in the office of the Chief of Naval Operations on October 15, 1917. The following officers were present: Admiral Benson, Admiral Mayo, Rear Admiral Earle, Capt. F. H. Schofield, Capt. R. R. Belknap, Commander Fullinwider, and Commander King.

At this conference Admiral Mayo produced for consideration the above-quoted Appendix I setting forth the British Admiralty version of the plan for the proposed barrage. There ensued a general examination and discussion of the plan; and, the consensus of opinion being favorable, the Chief of Naval Operations, Admiral Benson, after consultation with the Secretary of the Navy, then and there directed the Chief of Bureau of Ordnance to proceed with the procurement of 100,000 Mark VI mines. This action, so far as the adoption of the project was concerned, was only tentative pending a careful study of the British version; but it was regarded by the Bureau of Ordnance as tantamount to a decision to carry out the project and to provide all necessary material therefor without further delay.

Following the conference, the planning section of the Office of Naval Operations and representatives of the Bureau of Ordnance conferred informally as to details of the plan, and the papers in the case were then referred to the general board for consideration.

On October 17, 1917, while the barrage project was under consideration by the general board, the Chief of Naval Staff, British Admiralty, addressed the following dispatch to the Chief of Naval Operations:

"It will be necessary to increase the number of lines of United States mines in each system in the North Sea barrage from two to three if there should be any difficulty in using the lower antennæ of United States mines for first supplies. Could you please state an approximate date when supply of complete mines and sinkers will begin, stating at what rate the supply will be maintained?"

"As all British mine layers will be fully engaged in laying British portions of the barrage, will you please say how many United States mine layers will be available * * * and the output of United States mines? It is estimated that each ship could make five mine-laying trips a month. As a base for United States mines and mine layers, it is proposed to use Cromarty. The question of facilities for assembling ready for use, storage, and embarkation is being investigated on the spot. It is suggested that it is desirable that United States officers should confer with ours on this question and examine proposed arrangements as to suitability for dealing with United States mines and sinkers; also to ascertain as to whether our depot system will be suitable for application to United States mines. It is proposed that the necessary assembling and testing of United States mines and sinkers on receipt and before issue to mine layers should be dealt with by depot staffs provided by you, if possible. It is hoped that you will be able to agree with this. United States officers if sent over can report numbers required.

"I should be much obliged if you would inform me as soon as possible whether you can supply sinkers for United States mines."

On October 20, on the recommendation of the General Board, the Navy Department cabled Admiral Sims substantially as follows:

"The department requests to be informed whether the plan for the placing of a mine barrage across the North Sea on the Aberdeen-Ekersund line has the approval of the Admiralty. It is believed that the great experience of the British naval forces in North Sea operations and their experience in naval mining during the present war puts them in the best position to decide whether the proposed scheme is practicable in construction and maintenance, and whether in the opinion of the Admiralty it is the best scheme in sight for limiting the operations of enemy submarines, provided that the Straits of Dover can be efficiently closed to the passage of submarines which, if possible in the opinion of the department, should be done at the earliest possible date."

The following reply, in substance, was received on October 23 from the Admiralty:

"The mine barrier has been approved by Admiralty and the Admiralty now confirms approval. The preparations are rapidly proceeding.

"Admiralty's cable of 17th indicates the assistance desired from the United States of America. This scheme is considered by the Admiralty to be best to be carried out at a distance from the bases of the enemy. The Admiralty are working on a supplemental scheme for operation close inshore, but any such inshore operation has the defect that a passage through for submarines can eventually be cleared by the enemy.

"No scheme yet tried has been effective in closing the Dover Straits to submarines, but measures are being constantly improved, and they are, at the least, always a considerable deterrent. Mining operations on an extensive scale against submarines in the Straits of Dover commence in November. Owing to the lack of effective anti-submarine mine, this has hitherto been delayed."

The general board completed its consideration of the project and submitted its report to the Secretary of the Navy on October 24, 1917. A complete copy of this report is appended, but a summary of its "conclusions" is quoted here:

"* * * the general board is decidedly of the opinion that of the measures discussed * * * the scheme of closing the North Sea offers the best chances of success; that is, to close the North Sea by the Aberdeen-Ekersund barrier approved by the British Admiralty and to similarly close the Dover Strait.

"The general board does not underestimate the practical difficulties that must be overcome in providing the necessary material and transporting, placing, and maintaining it in the face of the determined efforts of the Germans to render the barrier abortive. Further, the barrier, even when placed, can not be effective without an adequate patrol. The general board is, however, encouraged to give its indorsement to this plan because it has the approval of the British Admiralty; it is proposed by it as the best practicable plan to meet present war conditions; the Chief of Bureau of Ordnance stated the material, mines, anchors, moorings, etc., can be surely supplied and the accompanying memorandum of Capt. R. R. Belknap, United States Navy, who has been actively engaged in conducting mining operations, points the way to handling the details of transporting and planting.

"It is assumed that the British Admiralty in approving this plan, recognizes the vital importance of the necessary patrol; that is it clearly seen by it where the required number of vessels is to be obtained, and that the extent of the cooperation required of the United States in this regard will be communicated to the United States Navy Department.

"If it is decided to proceed with the construction of the Aberdeen-Ekersund barrier, the general board recommends that the preliminaries be arranged at once, and that suitable officers of experience in mining operations be sent to England to arrange for our participation in the work."

The report of the general board was approved by the Secretary of the Navy October 29, 1917; and on the following day the northern barrage project was favorably acted upon by the President at a Cabinet meeting.

On November 1, the Chief of Naval Operations cabled the Admiralty:

"Department concurs in project for mine barrier Scotland to Norway and has already taken steps to fit out eight such mine planters to sail February 1 * * *. Expected begin shipment of mines January 15. Will send officers to confer and arrange details in a few days."

CHAPTER IV.—STATUS OF BARRAGE PROJECT ON NOVEMBER 1, 1917.

The American and British authorities having formally adopted the northern barrage project, it is desirable to sum up its major features as understood by the Navy Department, and more particularly by the mine section of the Bureau of Ordnance, whose function it was to procure and provide the mines appropriate to the project.

Referring to the previously quoted Appendix I, which dealt with the details of the proposed barrage, which presumably was the basis of approval by the Admiralty as well as our Navy Department, and which was generally in accordance with the original proposition of the Bureau of Ordnance, the plan embraced the following features:

(a) "The British Navy to be responsible for mining the Straits of Dover" * * *

(b) "The American and British Navies to cooperate in mining the Aberdeen-Norway route."

(c) On the initiative of the British Admiralty, the northern barrage was divided into three parts:

Area A. The "Notified area." This area to be made dangerous from the surface to 200 feet below it.

Area B and Area C. Deep mines with surface vessels and aircraft patrolling.

(d) Area A. Middle area about 160 miles long. To be mined by United States with American mines (antenna type). Barrage to consist of three systems, each system to have a line of mines at each of two depths—100 and 200 feet. Total requirement, 36,300 mines.

(e) Area B. Western area, about 60 miles long. To be mined by British with British mines (Horn type). Barrage to consist of three "systems," each system to have a line of mines at each of five depths—65, 95, 125, 155, and 185 feet. Total requirement, 67,500 mines.

(f) Area C. Eastern area, about 60 miles long. The British plans paper, Appendix I stated: "It is desirable that American mines should be used for this area as the number of sinkers required is thereby reduced considerably. A decision on this point can only be arrived at when it is known what type of sinker can be used with the American mine." This, taken in connection with the British inquiry of October 17 as to whether the United States could supply sinkers for United States mines, which was answered in the affirmative, left no doubt in the minds of department and Bureau

Ordnance officers concerned that the United States would mine Area C. Required, (100) American mines.

The following additional points set forth in the above-mentioned British paper were taken at their face value by American officers, especially since these points were in accordance with the original American proposition:

- a. "The mine field must be guarded."
- b. "The mine field should be as far from the enemy ports as other considerations will permit to enable our patrols to intercept any submarines damaged but not sunk outright by our mines." This implies the maintenance of a patrol.
- c. "The barrage must consist of both deep mines and mines near the surface; or, if deep mines only are used, the barrage must be patrolled in order to force the submarine to dive to the level of the deep mines."
- d. "It is also an advantage if the barrage is in such a position that our main fleet can be based on the enemy side of it, as this will not only give freedom of movement to our own fleet, but in addition should enable us to intercept any enemy vessels which endeavor to interfere with our barrage or the vessels patrolling it."
- e. "The line from Aberdeen to Norway is preferred for the following reasons:
 - a. "Its great distance from the enemy ports."
 - b. "The line is shorter than any other, with the exception of the Orkney & Shetland-Norway line, which is considered impracticable owing to the depth of water and the strong tides in the Fair Island Channel."
 - c. "The Grand Fleet, if based on Rosyth, is on the enemy side of the line."
 - d. "Any submarines damaged by mines will have a long way to get home and should be accounted for by our patrols."
 - e. "Whether Norway eventually comes in on the side of the Allies or not, the eastern end of the line will be far easier to guard than the northern end of the Goodwin-Jutland line, which has been suggested."
 - f. "It would be easier to bring pressure to bear on Norway to induce them to take steps to prevent submarines passing through their territorial waters than it would in the case of Denmark with their ever-present fear of invasion."
 - g. "The line Aberdeen-Norway deals with submarines using the Baltic exits as well as with those coming from North Sea ports."

The British version of the plan differed from the American proposition in one most important particular; namely, that the eastern part of the barrage, Area C, was to be deep mined only, leaving the surface safe for traffic and depending upon patrols to prevent the passage of enemy submarines. This part of the plan was foredoomed to failure, since it was obviously impossible for patrols to effectively guard such a large area, as had been demonstrated by British experience in the much smaller area of the Strait of Dover; but for the time being the plan was accepted by American officials, with the understanding that, in case this part of the plan should prove ineffective, surface mining could be extended through Area C later.

It was on the basis of the above understanding of the project that the Bureau of Ordnance proceeded with the design and procurement of the required mining material and that the Navy Department undertook all other necessary preparations for the project. The planting of the barrage was to begin as soon as possible in the following spring, 1918, to assume its completion during favorable weather of the summer or early fall. Therefore, there was little time in which to complete the details of design of the new mines, launch the huge manufacturing project, and obtain production in adequate quantities not later than February, which was necessary in order that the mines could be shipped abroad, assembled, and made ready for use by April, 1918.

CHAPTER V.—COORDINATION OF PREPARATIONS.

To insure a proper coordination of all necessary preparations for the northern barrage project, Capt. R. R. Belknap of the Office of Naval Operations, was placed in immediate charge in that office of the plans for the entire operation, which involved in greater or less degree all bureaus of the department. The Bureau of Ordnance was to furnish the mines and mining material; the Bureau of Construction and Repair, was chiefly concerned in the structural conversion of certain merchant ships into mine layers; the Bureau of Navigation had to furnish the officers and men to man the new mine squadron; the Naval Overseas Transport Service was to allocate sufficient cargo tonnage to maintain adequate and regular shipments of mining material; the Bureau of Supplies and Accounts was to take measures to handle the shipments of mines and other material, and so on.

All the above and other preparations constituted only one of the major naval operations then in hand, and there was the possibility that some essential part of the preparation might not be given its due precedence, either within the department or at

some navy yard, unless the various activities were carefully watched and their importance kept constantly to the fore. This was all the more necessary by reason of the fact that the new mine and its objective use were shrouded in mystery, very few officers being let into the secret, which it was hoped could be kept from the enemy until we were ready to begin actual mining operations in the North Sea.

Throughout these preparations, the project was mentioned in writing as little as possible, information and instructions to those concerned being communicated orally so that secrecy might be assured.

It was principally by means of informal conference between officers concerned that the many bureaus and offices quickly and effectively solved the multitudinous problem incidental to such a project. "Red tape" and formal routine methods were for the time being abolished, and those officers immediately charged with the work of preparation were practically accorded carte blanche.

In this connection, it is pertinent to note that the Secretary of the Navy, at the time of the project's adoption, stated that it had the strong interest and approval of all in high authority; that he himself desired every effort made to expedite it; that all who might be called upon for assistance should be informed of his wishes in this regard so that they should cooperate to the fullest extent; and that he should be immediately resorted to in any case where his action or influence might be needed.

CHAPTER VI.—DESIGN OF THE MINE.

The possibility of the northern barrage depended upon the successful design of the new mines to a far greater degree than is usual in such matters. Had nothing better than the ordinary type of mine, such as that used by the British, been available the northern barrage project would have been utterly impossible of execution within the time allowed by reason of the enormous number of mines required for a barrage 280 miles long. The combined resources of the United States and the Allies, especially in the matter of high explosives, could not have produced the required number of mines, nor could the combined mining forces have planted them in a single year. By the use of mines of the American (Antenna) type, the number required was reduced to approximately one-third, and the project became possible, provided always that the design of the new mine was right.

On November 1, 1917, after the barrage project had been finally and definitely adopted, the only parts of the Mark VI mine that had been completely designed were the firing mechanism and the mine case. However, the mine section of the Bureau of Ordnance, under the immediate direction of Commander Fullinwider, felt no doubt of its ability to complete a satisfactory development of the new mine and to get it into production in due time, its optimistic view of the situation being based on the facts that the only radically new element of the mine was the firing mechanism, which had been fairly well tested out; that the war experience of the British had evolved a satisfactory type of mine anchor which doubtless could be adapted to the American mine; and that the remaining features were matters of mechanical detail certainly susceptible of quick solution. In the circumstances, it was absolutely necessary to take chances, else the project would be delayed a full year and therefore be too late. It was fortunate that Rear Admiral Earle, the chief of bureau, was willing to accept the final responsibility in this matter and that he had sufficient confidence in the mine section to give it practically a free hand.

If the bureau had been at all conservative in the matter of developing the design and placing contracts for the mines, the northern barrage would never have been laid. It is a well known fact that no mechanism as complicated as a mine, or even a much simpler one, can be confidently expected to function as designed until complete models have been tested under service conditions and the usual minor defects have been discovered and remedied. Ordinarily, it requires at least a year to prove out such a design before it is considered wise to put it into production. Judged by ordinary standards, the action of the bureau in bringing about the adoption of this great project before there was any certainty of the efficiency of the new mine, thereby committing two Governments to very large expenditures, was, to say the least, hazardous. The bureau accepted the hazard advisedly, as the only thing to be done in the circumstances, and well knowing the odium that would attach in case of failure.

The problem confronting the bureau was to build a mine around an entirely new principle in mining, and around a firing gear outlined but not perfected. This mine must be efficient and yet must be capable of manufacture and assembly in great quantities, with as little expense of money as practicable, and necessarily with as little expenditure of time as absolutely possible. The bureau had departed from the usual, or contact, mine with its new firing gear, and had then proceeded to wipe the slate clean and make radical developments in the entire mine.

Practically all mines, except the later German types, had been made, up to that time, with the explosive in separate charge chambers, which were, after loading, placed within the mine case proper. This presented the triple disadvantage of additional weight; cost of time and money in manufacture, loading, and assembly; and, most serious, the interposition of an air cushion surrounding the charge chamber between the first explosive force and the water, thereby greatly reducing the force of the water hammer below caused by the explosion, which blow was that relied upon to damage the submarine touching the antenna. These difficulties were all obviated by selecting an explosive, T. N. T., which could be readily cast and cooled, and casting this direct into the completed mine case, using no separate charge chamber.

In addition, similarly the practice of carrying the detonator fixed in the explosive was a source of great danger in case of accident or fire or in case the mine layers were engaged in action with the mines on board. The safety chamber device of service was adopted, so that the detonator might not be in contact with the main explosive until after the mine had been launched and submerged.

The design of antenna gear presented a problem that had, as far as was known, no precedent in the military or commercial arts, and required considerable initial design ability and experimentation.

As a matter of fact, the officers responsible for the mine freely admitted, to themselves, the certainty that the design would have to be modified more or less after service tests, and therefore shaped the design so that any one of its features could be modified during production with little or no effect on the others. In other words, every possible precaution was taken against possible loss of time and money. The result was very satisfactory; very few changes were necessary after getting into production; and when the first complete mines were assembled and tested under service conditions in March, 1918, they functioned as designed, and only very minor improvements, involving no delay in the project, were found to be desirable or necessary.

During the initial plans for the mine, the mine section of the bureau consisted of Commander S. P. Fullinwider, Lieut. (subsequently commander) J. A. Schofield, U. S. N. R. F., and, acting as the experimental officer of that section by virtue of his experimental duties in the bureau, Lieut. T. S. Wilkinson, jr. As the project began to take shape and became approved, the bureau added to the mine section certain line and reserve officers, who will be mentioned hereafter as their duties appear.

In the initial stages of design, Commander Fullinwider assumed cognizance of the mine case, anchor, and antenna gear, leaving Lieut. Wilkinson the firing gear, the extender, and the mine loading—that is, explosives and detonator. With the advent of other officers, these duties were further subdivided as follows: To Commander Schofield, the mine case; to Lieut. O. W. Bagby, United States Navy, and Lieut. S. W. Cook, United States Navy Reserve Force, the mine anchor, in conjunction with Lieut. Commander H. Isherwood, Royal Navy Volunteer Reserve (noted below); to Lieut. Commander W. A. Corley, United States Navy, the antenna gear; to Lieut. C. H. Wright, United States Navy, the firing gear and extender; to Lieut. B. W. Grimes, United States Navy Reserve Force, the explosives. This division of responsibilities held through the design stage and through the production of the parts of the mine, as described in the succeeding chapter of this history.

At various times during the period of design and experimentation the Bureau of Ordnance had the advantage of the advice and assistance of three experienced mining officers of the British Navy. On May 5, 1917, Lieut. Commander H. O. Mock, Royal Navy Volunteer Reserve, arrived in the bureau, having been thus assigned by the British Admiralty to assist and advise in matters pertaining to mines. This was in accordance with a plan adopted immediately upon the entrance of the United States into the war, whereunder each of the two naval departments undertook to furnish the other with information to their mutual advantage. Lieut. Commander Mock brought to the Bureau of Ordnance the latest information and experience regarding the British mines and mining, more particularly information concerning mine anchors.

During Lieut. Commander Mock's stay in the bureau the Mark VI mine-firing device (K-1 device) was evolved, and he was present during much of the experimental work in connection therewith, although he did not assist in the evolution of the design. He was an early convert to the value of the new device; and upon his return to England in October, 1917, a model of the new device was transmitted by him for the Admiralty's information, the question of whether or not the British would join the Americans in the barrage project being then under consideration. Lieut. Commander Mock considered the K-1 device of great promise, and looked upon the new mine then in process of evolution as being superior for purposes of antisubmarine warfare to any other then existing type.

Lieut. De Salis, Royal Navy, arrived September 3, 1917, having been sent to this country to examine the Mark VI mine and report to the British Admiralty as to its probable value for the proposed North Sea barrage. He was sent to this country on the initiative of the British Admiralty and apparently with a view to satisfying the Admiralty that our Navy Department really had what it had previously stated it had—a mine superior to existing types and peculiarly adapted to antisubmarine warfare. In short, the British Admiralty took this means of confirming the Bureau of Ordnance opinion and estimate of its own design and product before agreeing to cooperate in the establishment of a barrage.

After Lieut. De Salis had reported to the chief of bureau on the above-mentioned date, the chief of the mine section explained to him the characteristics of the new mine-firing device, and accompanied him that evening to the naval torpedo station, Newport, R. I., to witness tests. These tests were carried out, with inadequate preparation and facilities, on the two following days, September 4 and 5. Lieut. De Salis was soon convinced that the new device had merit. On September 7 he cabled the Admiralty in part as follows:

"The mechanism is safe and simple. Still in trial stage.

"It has worked perfectly for safety and bumping. No vessel really suitable was present, so trials were rather crude. Trial of countermining was not very satisfactory, but the faults revealed can be remedied.

"Mine designed is 33-inch diameter, and could be used with B. E. or Mark VI sinker. A 38-inch diameter mine would be designed if desired. No sinker is yet designed, and it is intended to copy ours.

"United States officials state that delivery of a thousand mines and mechanisms per diem is anticipated to commence December 1.

"Proposals are that combined operations should be worked out for use of these mines. They would provide the mechanisms and mines, while the British provide minelayers and sinkers.

"They offer a hundred thousand. Details of strategical proposals are known to Admiral Mayo.

"It is recommended that American offer should be accepted, our own output not being decreased in consequence.

"The questions to be settled subsequently are manufacture of sinker, size of mine, and supply of explosive. They have sufficient crude T. N. T. and are willing to supply it.

"I still adhere to the opinions expressed September 3, but advantages to outweigh them are: Simplicity, certainty of firing, large danger zone, and the element of surprise if the secret is kept."

On September 10 the Admiralty cabled Lieut. De Salis:

"Greatly appreciate offer of United States. Fully recognize the value of the increased danger zone near mines, but fear is expressed that if antenna only can fire mine, life in this climate would be limited by durability of antenna, which is necessarily short.

"Reply forthwith if antenna principle can be applied to horned mines, whose plans are now in America; or, conversely, if American mines can be fitted with a firing arrangement thoroughly reliable, or with horns, so that effectiveness as complete mines would remain after antenna has parted."

Lieut. de Salis, after consulting the Bureau of Ordnance, replied, September 11:

"Americans propose to fit fixed insulated projections of copper on mine case in parallel to antenna, so that mine will remain effective on same principle if it is hit whether the antenna is in place or not. Firing battery will then determine life of mine. It is sealed up, and no current is taken from it until moment of firing."

On September 12 Lieut. de Salis again cabled the Admiralty in part as follows:

"United States officers are extremely confident as to life of battery. In addition, halfway down antenna a float will be fitted, in which case wave action should not much affect lower half.

"Acceptance of the offer as it stands is strongly recommended.

"Design could subsequently be altered for fitting horns, should endurance trials which are now in hand prove unsatisfactory.

"Admiral Benson wishes to be informed of the proposed strategical use which may be decided on if offer is accepted, and of the numbers required.

"The bureau are requesting that a mine designer may be lent them to cooperate and insure fitting of mine on sinker."

Lieut. de Salis, during his connection with the Bureau of Ordnance, was an observer for the British Admiralty, and probably had much to do with the Admiralty's favorable consideration of the proposed joint project. In addition, Lieut. de Salis furnished the Bureau information of a general nature regarding British mines, mining equipment,

mining practice. He did not, however, have any influence on the design of the Mark VI mine. Lieut. de Salis spent much of his time at the Naval Torpedo Station, Newport, where he conducted some tests with floats and antennae. He returned to England in December, 1917.

In the original proposition for a joint American and British barrage operation, it was proposed by the Bureau of Ordnance that the British should furnish the anchors and that the United States should supply all the mines. This proposition was put forth for several reasons: First, there was a shortage of tonnage available for the transport of the material abroad, and this shortage was growing more and more serious day to day as the result of the great activity at that time of the enemy submarines. The leadweight of the anchors alone required for the barrage was estimated at about 100 tons. Second, the British had a quite satisfactory type of anchor, which had been proved out during the war, and which, with minor modifications, could be adapted to fit the American mine. Third, it was originally contemplated that British mine planters would assist the United States Mine Force in the planting of mines, and therefore the mine tracks and mining equipment in general should be standardized in the two services. Fourth, it was considered only fair that, if the barrage were to be a joint operation, the British should bear a share of the cost and production of material.

After much delay in arriving at an understanding, it was finally decided to produce the anchors as well as the mines in this country. To facilitate the design of the anchor, and particularly with a view to making it standard with British mine layers' equipment, the British Admiralty was requested to send an officer to the Bureau of Ordnance who was competent to modify the British design of anchor to adapt it to the Mark VI mine. The Admiralty promptly acceded to this request, and Lieut. Commander Isherwood, R. N. V. R., arrived in the bureau early in October, 1917. He brought with him the detailed design of the British Mark VIII sinker (mine anchor), and this was found upon examination to require very little modification about the Mark VI mine. Lieut. Commander Isherwood, with the assistance of Bureau of Ordnance draftsmen, completed the redesign of the British sinker, referred to hereafter as the anchor, Mark VI; and on November 10 the design was ready for submission to the prospective bidders.

While the Mark VI anchor was very similar to the British Mark VIII sinker, it differed in detail sufficiently to have warranted thorough tests before its adoption, if the time been available. However, as not a day could be lost without correspondingly delaying the execution of the project, it was decided after very careful study of the design that it would be reasonably safe to proceed with production; and contracts were placed immediately with three prominent automobile concerns in Detroit, Mich. Lieut. Commander Isherwood remained in the United States until the anchors were well along in production and until after practical tests with complete mines had been carried out by vessels of the mine force just prior to their departure for the North Sea. The anchor proved most satisfactory in every respect, and, as it is now believed, superior in its functioning to the British Mark VIII sinker from which it was adapted.

The mine case was entirely a Bureau of Ordnance design. It was formed of two hemispheres of steel welded together at the equator. It had an opening in the top 7 inches in diameter to receive the firing gear, and a smaller opening in the bottom to take the booster charge and the detonator extender mechanism. Built into the lower hemisphere, in the axis of the case, was a steel tube which housed the booster charge and extender mechanism. The charge of 300 pounds of grade B trinitrotoluol was put directly into the lower hemisphere of the case, it being found by experiment that the charge was sufficiently anchored in place by the bond between it and the surface of the case and central tube and by four stay braces which supported the tube. This simple form of construction saved considerable weight and permitted of the mine case being kept within comparatively small dimensions, 34 inches diameter. The British mine had a diameter of 48 inches. The buoyancy of the Mark VI mine was 285 pounds, which is ample for mines to be used where the current is not greater than 3 knots. The mine case had welded to it a lifting eye, also hooks for securing the antenna system and the anchor. Four small holes in the case about 2 inches above the equator were provided for attaching firing "horns" in parallel with the antenna.

The extender mechanism, which carried the detonator in a retracted, or safe, position relative to the booster charge, and which, under a hydrostatic pressure corresponding to a depth of 25 feet, extended the detonator to its firing position in the axis of the booster charge, was a lazy-tongs device, which also was originated and designed in the mine section. This mechanism provided an excellent safety device, since a mine which floated or which was submerged to a depth less than 25 feet would be safe.

A similar hydrostatic safety device was incorporated in the firing mechanism: both of these devices would have to fail to make the mine dangerous on or near surface.

The antenna floats, the fittings in connection therewith, and the means of assembling the antenna system with the mine, proved the most troublesome parts to design, though they appear very simple. Experiments were first made with floats of waterproofed wood, but without success, since it was found impracticable to guard against their water-logging when subjected to deep submergence for considerable periods. Ultimately, three different types of float were successfully produced and used. For mines of the upper level a thin walled spherical copper float was used; for mines submerged 150 to 300 feet a spherical-cylindrical steel float with a wall thickness of 0.1 inch was used. The third type, which finally replaced the copper floats, was made up of balsa and skillfully waterproofed to withstand hydrostatic pressure safely to at least 100 feet submergence. For mines of the upper level, two floats were used on each antenna, the lower one being placed a little above the middle point of the antenna, so that, in the event of the upper float carrying away, no part of the antenna could possibly come into contact with the mine case and fire the mine.

The antennæ of the lower level mines were provided with a single steel float. These mines were at such depths as to be entirely unaffected by wave motion, and one float could be depended upon for an indefinite life.

The mechanism by means of which the antenna and floats were secured to the mine case until the mine reached a predetermined depth and then permitted the release in such a way as to avoid fouling, gave much difficulty, but the problem was very satisfactorily solved with the assistance of the *Baltimore*.

Discussion of many of the items of design, including that of the K-1 device and firing mechanism, is omitted here as unnecessary and because they are still regarded as confidential.

One of the most important and indispensable of the preparations was the trying out of the new mine under service conditions. In the earlier stages, complete mines were not available; and they did not become available until March, 1918. In the meantime, however, the *Baltimore*, which had been designated to carry out tests, performed such experiments as could be had with improvised material, and assisted in the design of some parts of the gear, notably the means of assembling the antenna floats with the mine and their release gear. This work continued until about December 20, 1917, when it became necessary for the *Baltimore* to go to the yard for fitting out for service abroad. It had been intended that this vessel should resume experiments and practice with the completed mines in March, but before that time it became necessary to send her abroad to assist in British mining operations.

The mine trials were taken up by the *San Francisco* in March, when the first mines were ready. Trials were carried out in the lower Chesapeake, later in Narragansett Bay, and finally off Cape Anne. The results of these trials were all that could be expected. With the exception of a very few minor mechanical faults, which were readily corrected, the mine and anchor functioned as designed; and the action of the Bureau of Ordnance in having proceeded with the manufacture of 100,000 mines in advance of such tests was thus validated. A most important result of the trials was the confidence engendered in the personnel of the mine force in the value and safety of the new mine.

It may be remarked in passing that the result of the trials lifted a heavy load from the minds of those officers of the Bureau of Ordnance who had staked all on a "paper design" and proceeded with an enormous manufacturing program in advance of complete tests.

CHAPTER VII.—THE MANUFACTURING PROJECT.

The firing mechanism for the new mine was in quantity production before any other part of the mine had been designed. The mine section had made tentative sketches of the several principal features of the mine, but none of the details had been decided upon. One reason for this was the fact that until the firing mechanism had been conclusively tested and adopted, late in July, there was insufficient information and data on which to proceed with the other points of design. Another point was that until November, 1917, there was insufficient personnel in the mine section to perform the duties of the bureau pertaining to mines and mining, depth charges, submarine nets, etc.

The Bureau of Ordnance, having anticipated the favorable outcome of the mine barrage proposition, had placed a contract for 10,000 mine-firing mechanisms (K-1 devices) as early as August 9, 1917, and another contract for 90,000 additional devices on October 3, 1917, nearly a month before the barrage project was definitely adopted.

In view of the fact that there were so many uncertainties entering into the design of the mine, it was decided that the only safe plan was to follow the practice which is quite common in the automobile industry—that is, to divide the mine into groups of parts, each group being quite a separate design problem, all so standardized that the several groups would assemble into a complete mine. Thus the mine was separated into the following groups: Firing mechanism, extender mechanism, mine case, anchor, antenna and floats, horn device, and release gear.

Each group was designed and tested out quite independently of the others, a very definite general plan for the mine, of course, being kept in view. This method permitted of modifications of any one group without detriment to the others.

Another reason for following this method of design was that it would facilitate manufacture. There was no plant in the United States that had had experience in the manufacture of mines except the Norfolk Navy Yard, which yard was overwhelmed with other work after the outbreak of the war and could not be depended upon for any considerable manufacture of mine material. By designing the mine as an assembly proposition, its many parts could be manufactured in commercial plants with great rapidity; and by carefully standardizing all parts, they could finally be brought together and satisfactorily assembled.

The general economic conditions of the country were such that at the time when it became necessary to manufacture the Mark VI mine the passenger-automobile industry became available for war work through a gradual decrease in output of automobiles. It is believed that the Bureau of Ordnance was the first of the war agencies to take advantage of the wonderful resources of the automobile factories; and no difficulty whatever was found in obtaining keen competition among these factories for the manufacture of parts. Generally speaking, the automobile plant is ideal for the production of mine material, with the exception of the firing mechanism, because the plant is organized for quantity production and the character of work and workmanship is practically the same for automobiles and mines.

Still another reason for pursuing this method of manufacture was that only by this means could secrecy regarding the characteristics of the mine be preserved. It is obvious that if 100 different parts of a mine are manufactured by as many different factories, most of which are kept in ignorance of the fact that they are producing mine material, no one would have sufficient information on which to visualize the complete mine, and therefore no one could possibly betray the secret to the enemy. This idea was carried still further. Even at the point of assembly of the material for transshipment abroad the parts were not assembled into a mine but were shipped in groups to the overseas assembly bases. In short, no mines were completely assembled in this country, with the exception of a few for test purposes on board vessels of the mine force in March, 1918. It is therefore believed that the enemy, notwithstanding his many sympathizers in the United States and his secret service, had no inkling of the character of the mine until long after it was placed in use in the North Sea. It was comparatively unimportant to maintain secrecy after the mines were once in use, for it was probable that the enemy could not devise any means of effectively counteracting or protecting himself against the mine within, say, a year after he gained knowledge of it, by which time it was expected that the war would be over. In this connection it may be stated that a number of American mines went adrift in the North Sea, as is usual in such operations, and were cast up on the coast of Norway, where they were recovered, disassembled, and examined by Norwegian officials, but assurances were obtained that information regarding these mines would be regarded as confidential.

The firing mechanism has been referred to above as a unit of the assembled mine; but as a matter of fact it was subdivided into its component parts and manufactured by more than a score of different factories, none of which was permitted to know that it was manufacturing mine material. Only certain officials of the private plant that assembled the firing mechanism knew that it was intended for a mine.

The Mark VI mine was designed to be very safe in handling; and that this object was attained is well demonstrated by the fact that 85,000 of these mines were loaded and shipped abroad and that about 57,000 of them were planted in the barrage without accident. This result is the more extraordinary for the following reasons:

(a) The mines had to be manufactured by quantity production methods, and rigid inspection was quite impossible under the then existing conditions.

(b) The inspection force was inadequate in numbers, and it was composed largely of inexperienced officers and men—inexperienced not only in mine material, but in inspection work in general.

(c) The manufacturers were inexperienced in munitions work, and almost every one of the hundreds of plants engaged in the work was an unknown quantity as to reliability, quality of product, possibility of sabotage, etc. Due investigation and

careful "sizing up" of the managing personnel of each plant concerned reassured the bureau in almost every case.

(d) The mine had to be loaded, shipped, assembled, inspected, and tested by personnel almost entirely without previous experience with mines and explosives.

During the period of purchasing supplies, in the task of which there was a multitude of details, Lieut. (Junior Grade) A. B. Peacock, Supply Corps, United States Naval Reserve Force, handled the purchasing matters connected with this vast amount of divers materials, a duty that required his working in close operation with the main section of the bureau.

It was owing to these adverse conditions, together with the fact that the mine was to be handled by the planters as "fixed ammunition," that it was designed to be as nearly fool-proof as possible.

The design and manufacture of the various elements of the mine was a work involving an immense amount of detail, which it is unnecessary to dwell upon here; but a few points are of special interest in their bearing on the success of the project.

It has been mentioned above that the new mine was designed to be issued to mine layers as "fixed ammunition." This was a radical departure from conventional practice, and British mining officers attached to the bureau apparently never became reconciled to the bureau's view that practically all necessary tests and inspection could and should be made prior to the receipt of mines on board. The new idea was adopted primarily because of the obvious necessity for rapid planting, the number of planters being limited. After having become committed to this plan, it was fairly easy for the bureau to design, manufacture, and inspect accordingly. For example, the mine case was designed to be as simple and fool-proof as possible, and it was given 100 per cent inspection at the factories for watertightness; so there was no good reason for subjecting the case to another such test at the overseas bases or after its receipt on board ship.

Another point to which the bureau gave careful attention was to insure that, in the event of a premature or accidental explosion of a mine, it would necessarily occur only after a safe interval after launching. As for taking mines aboard ship with the detonators in place the bureau adopted this plan only after conclusive tests had shown that a detonator in the "safe" position could not explode the charge.

The well-known fuel shortage in the winter of 1917-18, the almost unprecedented severity of the weather, the freight embargoes on the railroads and congestion of traffic generally, and labor troubles, all operated to delay the production of mine material and other essential preparations for the project. The situation was very critical for some weeks, largely because these conditions affected several hundred plants engaged, and the failure of any one of them to produce its share would have resulted in possibly disastrous delay to the whole project. Some delay did, in fact, result, but as there was a nearly corresponding delay in the completion of vessels of the mine force and of the overseas bases the failure to meet the manufacturing schedule proved of no particular consequence. It is estimated that the above-mentioned adverse conditions resulted in delaying the beginning of quantity production of complete mines about six weeks.

During the period of railroad freight congestion an immense quantity of mine material was handled by express shipments, in some cases whole trainloads being handled on passenger schedules from Detroit to the seaboard. It is believed that every known expedient was utilized to maintain production and expedite shipment; armed guards and traffic agents accompanied shipments; motor trucks were used when other service was unavailable; freight embargoes were lifted after great effort in special cases; tracing of missing shipments was a constant work; and shortage of fuel was met and overcome in many ways.

There was only one real failure of an important contractor to deliver material on time, and this resulted in a slight delay in mining operations. It was an almost invariable rule of the bureau to divide the order for any one part of mining material between at least two contractors in order to guard against a possible failure on the part of a contractor and consequent shortage of essential material. In the one case in which this rule was deviated from, the article being a comparatively simple one and the contractor being apparently more than able to meet his obligations, the contractor failed to deliver the specified production; and it then became necessary to tool up three other plants and cancel the original contract.

The bureau planned for a production of 1,000 mines a day, and it was found soon after getting into production that this rate could easily be exceeded if desired. In fact, it became difficult to hold the production of anchors and mine cases down to this figure. In other words, the bureau could have produced mines at any rate desired, except possibly in the matter of mooring cable, the wire-rope manufacturers being heavily burdened with orders for wire for aircraft, shipping, coal mines, etc.

CHAPTER VIII.—MINE LOADING PLANT, ST. JULIENS CREEK, VA.

An important item of preparation for the barrage project was the creation of a complete mine loading plant capable of receiving, loading, and shipping 1,000 mine cases a day, there being no plant in the United States at that time capable of handling any considerable number of mines.

The design of a plant that could handle the situation had to be made by the Bureau of Ordnance and the Bureau of Yards and Docks in consultation. Many proposals were sent out in order to obtain ideas upon automatic machinery, and finally a plan, modified somewhat after a scheme suggested by Boyle-Robertson Construction Co., was accepted and completed. The plant was built by the Boyle-Robertson Construction Co. of Washington, D. C. Commander Kirby Smith, Civil Engineer Corps, United States Navy, was responsible for pushing to completion, in the midst of many difficulties, both in design and construction, this mine-loading plant.

It was decided to locate this plant near the Navy Yard, Norfolk, Va., the point selected for the assembly and shipment overseas of all barrage material; and the only immediately available site being at the Naval Ammunition Depot, that point was chosen. Ground for the plant was broken on October 25, 1917; but bad weather set in early in November and continued with unprecedented severity until spring, so construction work was carried on under most adverse conditions. Aggravating the situation, there was a labor shortage. However, the plant was ready for work in March, 1918, or practically as soon as needed, there having been delays in all parts of the project due to extreme weather conditions, freight embargoes, fuel shortages, labor troubles, changes of barrage plan, etc.

This plant, with its accompanying barracks for the housing of its operatives, covers an area approximately 3,000 feet by 800 feet, including the wharf; and consists of 22 buildings, including a mine case storage building, 600 by 100 feet, capable of storing 100,000 empty cases; a melting plant, capable of melting and pouring T. N. T. for at least 1,000 mines a day; a cooling building, where the loaded mines were permitted to cool preparatory to shipment; a T. N. T. ready storage building, capacity 4,000,000 pounds; a heating plant; and a wharf.

The entire plant was excellently equipped with conveyors and labor-saving facilities; and all parts were planned and constructed to give the utmost efficiency consistent with safety. The rated daily capacity of 1,000 was exceeded by about 50 per cent on one occasion; and a total of more than 73,000 mines, involving the melting and handling of over 22,000,000 pounds of T. N. T., were loaded here without accident. In addition, 17,000 mines loaded by contract at the Du Pont Co.'s works at Barksdale, La., were received here and shipped abroad.

The loading plant cost approximately \$400,000, and its operating cost was at the rate of about \$412,000 per annum. About 400 enlisted men were required to man the plant; and, in addition, from 200 to 400 were employed in the shipment of mines; that is, in loading them into mine-carrying vessels.

A loading plant of this type and scale had hitherto been unknown, not only in this country, but abroad. Difficulties were encountered in the construction thereof, and a species of accident, fortunately unfulfilled, were made by visiting foreign experts killed in amateur plants. The Bureau of Ordnance, however, took every precaution to insure that the operation of this plant should be attended with the minimum amount of danger. The chief of the bureau took upon himself the limiting of the steam pressure to a maximum which he considered, from his experience with explosives, would result in satisfactory melting of T. N. T., and thus loading the mines, but reduced the danger of detonation in the process to the minimum possible. Exact knowledge upon this point is not yet to be had, as experience with this explosive has been too short to permit real conclusions. This decision was one that was very serious, as he had before him the fact that, in the melting of high explosives abroad, a detonation that destroyed an entire plant together with every person in the same had occurred and that the proposed automatic operation of loading mines was in a nature exactly similar to the work under way in that plant.

Petty officers and enlisted men of the Naval Reserve Force were secured for the operating personnel of this mine-loading plant. They accepted the risk, which they knew was a great one, together with the discomforts, such as working in an atmosphere of T. N. T. dust, working nights, and living in poor quarters in a very bad locality, so far as health is concerned, cheerfully, and with most successful results in the completion of the material for the northern barrage.

Commander W. L. Pryor, United States Navy, was in command of this mine-loading plant in addition to his duties in charge of the ammunition depot at St. Juliens Creek. Much work in connection with loading of mines upon the mine carrier after the T. N. T. had been cast into the mines devolved upon Commander Pryor. The

success and general efficiency of the plant was brought about mainly through the untiring efforts and care of Commander Pryor in dealing with the reserve personnel, making them acquainted with the necessity for care and the reasons they were called upon to bear so many discomforts and undergo the risks.

In order to prevent delay in delivery, which might have been caused by delay in completion of this Navy plant, the bureau arranged with the du Pont Co. to load mines direct at its T. N. T. plant at Barksdale, Wis., and some 17,000 mines were loaded there during the months of February and March, 1918.

The Army had plainly informed the Navy that it required all the toluol in the country for use in the manufacture of its own explosives, and for this reason it was imperative if the mine barrage was to be completed to secure some other explosive for use in the mines. The explosive effects of amatol, a substitute for T. N. T. in general use abroad, had been frequently criticized for lack of effectiveness. Amatol also required more toluol than the Navy could obtain without asking the Army to reduce its requirements. E. I. du Pont de Nemours & Co. proposed to the bureau the use of trinitroxylol, which could be produced by the nitration of xylol, a by-product of coal-tar distillations at that time not widely used. Further investigation by Lieut. Commander T. S. Wilkinson, United States Navy, in collaboration with chemists of E. I. du Pont de Nemours & Co., finally developed the fact that trinitroxylol was an explosive substance which would serve very acceptably as a diluent for T. N. T., and that the use of a mixture of these two substances in mines would be practically as satisfactory as the use of T. N. T. alone (the mixture adopted consisted of 60 per cent trinitroxylol and 40 per cent of T. N. T.), although the mixture was not quite as convenient to handle as T. N. T. Trinitroxylol was subsequently known as T. N. X., and the mixture of T. N. T. with T. N. X. for mine charges was called toxyl.

CHAPTER IX.—ASSEMBLY AND SHIPMENT OF MINE MATERIAL.

Since the Mark VI mines were not to be assembled short of Bases 17 and 18 in Scotland, and since all component parts had to be at all times available at those bases, it was essential that the flow of all material from the many points of manufacture to the overseas shipping point, Norfolk, and thence to the bases abroad should be maintained at the proper rate. Failure in this respect would result either in a shortage of material and consequent delay of the planting operations or in a congestion of an undue amount of material which could not be stored and properly cared for.

At the inception of the movement it was decided between the Bureaus of Ordnance and Supplies and Accounts that it would be necessary to commandeer one of the large export terminal piers in the vicinity of the navy yard, Norfolk, for the handling of mine shipments; and after a survey of the situation, Southern Railway Pier No. 4, at Pinners Point, Va., was taken over by the Navy. This pier, which is 875 by 270 feet and which can accommodate seven cargo vessels of the Lake type at a time, was ideal for the purpose. It, of course, is roofed over and has adequate rail facilities. The rental of the pier was \$81,000 a year and the annual cost of operation was about \$350,000.

When the project was planned it was contemplated shipping all mine material, including the loaded mine cases, from this pier, but the local authorities protested against the handling of explosives at this point because of the danger to Norfolk and Portsmouth, and it became necessary to load the explosive elements into the mine-carrying vessels at the mine-loading plant at St. Juliens Creek, about 2 miles above the navy yard. To this end, considerable dredging had to be done at the mine plant, fixed moorings were put down, and the dock facilities at the mine plant were enlarged and improved to accommodate the carriers. Provision was made for working 24 hours a day at the mine plant and at the pier when necessary. Only Navy personnel was employed. It would have been quite impossible to operate satisfactorily at either the pier or the mine plant with civilian labor, owing to the irregularity of working hours, the frequent necessity of night work in order to get vessels loaded in time to join the weekly convoys, and also the necessity of good discipline, safety, and secrecy.

Pier 4 was used for storage as well as for shipments. It had a capacity of about 40,000 mine anchors and other nonexplosive parts. A naval force of about 400 men was continually employed at the pier.

The receipt and shipment of mine material at the pier was under the cognizance of a supply officer detailed by the Bureau of Supplies and Accounts to that exclusive duty; but the Bureau of Ordnance also had its representative there to act as liaison officer between the bureau and the supply officer. To this liaison officer were communicated by telephone complete detailed instructions daily as to shipments, not only from the pier but also the mine loading plant, such instructions being confirmed to the supply officer in writing. There was never the slightest delay or confusion in

handling of the business, this because of the excellent cooperative spirit and zeal among all concerned in the project.

In the mine section of the Bureau of Ordnance, Lieut. Commander H. E. Fischer had as his principal duty, the maintenance of the flow of material from its source to final destination. By means of telephone and telegraph he was in constant touch with the material situation from the hundreds of factories to the bases overseas, and records at all times showed the exact condition of affairs. In all this, he acted in cooperation with the traffic and other offices of the Bureau of Supplies and Accounts as well as with the officers of the mine section. He also was in close cooperation with the Office of Naval Operations regarding the loading and sailing of the mine carriers.

Weekly inventory sheets and monthly reports showing receipts and expenditures of mines and parts at bases 17 and 18 were received, but were not of much value, as they were about one month old when received. Therefore, in order to anticipate shipments, it was necessary to resort to speculation to a very considerable degree. The results were, however, quite satisfactory.

In the inception of the project, the Navy Department, secured the allocation of a fleet of 24 cargo vessels of the "Lake" class for exclusive use as mine carriers. These vessels, a list of which is appended, were armed for defense against submarines, were manned by Naval Reserve crews, and were handled by the Naval Overseas Transportation Service (operations). They were rather small, averaging about 3,000 tons dead-weight capacity, but by reason of their light draft were well suited to the purpose, since larger and deeper vessels could not have been so readily loaded or discharged at the terminals selected; in fact, the harbor of one of the discharging points designated by the British authorities could not accommodate ships drawing more than 20 feet. The carriers were selected also with a view to carrying a comparatively small number of mines in each hull, so as to minimize the effect on the whole project in the event of a vessel being lost. Among other preparations, requiring navy-yard work, was the fitting of these vessels with additional crew accommodations; the provision for additional cargo coal for themselves, as they were originally short-radius ships; and provision of facilities for carrying 300 to 500 tons of fuel oil cargo for naval vessels overseas. In general, a cargo was made up of 2,000 mines with anchors and fittings complete and of about 500 tons of such miscellaneous naval supplies as were safe to handle in conjunction with high explosives, the remaining 1,000 tons of cargo space being assigned to extra bunker coal and fuel oil, the latter carried in the double bottoms. The mines were shipped disassembled to economize space; but it would have been undesirable in any event to ship them otherwise, in view of the fact that the work of handling, testing, and inspection at the overseas bases was facilitated by shipping them disassembled.

Sailings of the carriers averaged about two ships every seven or eight days, half in Norfolk convoys and half in Halifax convoys. It took a ship in a Norfolk convoy about 20 days to make the trip across, and in a Halifax convoy 21 days. From 65 to 70 days were required for a round trip or complete cycle.

Of the 24 carriers, only one, the *Lake Moor*, was lost, sunk by an enemy submarine off the coast of Ireland on April 11, 1918, unfortunately with the loss of most of her crew, and of about 1,500 tons of mine material, mostly anchors.

CHAPTER X.—OVERSEAS MINE BASES 17 AND 18.

On account of the great demand for shipping, it was early realized that in order to conserve cargo space, and for other reasons, it would be necessary to ship the mines or the North Sea barrage disassembled. In this manner it would be possible for a vessel to carry approximately three times as many mines as she would have been able to do had she been loaded with assembled units. On the other hand, this procedure necessitated the erection of elaborate assembly establishments in Great Britain; but this consideration was of secondary importance when compared with the great necessity for economizing shipping. It may be mentioned in this connection that there were no mine assembly facilities in the United States, since all ammunition depots were congested with other work, and new assembly plants would have had to be created in any event, either at home or abroad.

It will be remembered that in the early stages of the consideration of the barrage, one of the proposals made was that Great Britain should furnish the men necessary to assemble the American mines. Accordingly, a board was appointed by the Admiralty on October 6, 1917, which has generally been referred to as the Lockhart-Leith Committee, to investigate and report on the various suitable localities for mine depots for this project. The report of the committee, dated October 26, discussed in detail the possible locations for such bases, reviewed the transportation facilities, and

gave as their decision that the most suitable locations were the Dalmore distillery at Dalmore, Alness, and the Glen Albyn distillery at Inverness. The report went into considerable detail, outlining exactly what buildings would be required as well as the new construction and machinery, and estimated the personnel requirements. This report and its recommendations were approved by the Admiralty; and the distilleries at Dalmore and Glen Albyn were at once commandeered for use as mine bases.

Under date of October 26, 1917, the Bureau of Ordnance cabled Admiral Sims informing him that the bureau was preparing to manufacture mines in sufficient quantity for the operation contemplated, and that it was expected that the shipment of these mines would commence soon after the 1st of January, 1918. This cablegram further stated that the bureau desired to send Commander O. G. Murfin as its representative, under the force commander, to be placed in command of the mine depot which was to be established at Cromarty; also that several officers from the bureau were being trained in the assembling and handling of mines and would be sent to assist him. This cablegram was followed by a letter from the Bureau of Ordnance dated October 31, 1917, in which the subjects referred to in the cablegram were commented on at length.

On November 1, 1917, the Chief of Naval Operations cabled Admiral Sims to the effect that the department concurred in the project of the mine barrier from Scotland to Norway and was taking steps to outfit eight mine planters to sail about February 1, and that they were also expediting the completion of 12 mine sweepers. This cablegram further stated that it was expected that the shipment of mines would begin about January 15, and that officers would be sent to confer and to arrange details within a few days.

The report of the Lockhart-Leith Committee was transmitted by the Admiralty to Admiral Sims, in London, who, in order to give the department early information relative to the selection and requirements of the two bases, sent the following cable on November 2:

"Admiralty committee has investigated bases for northern mine barrage and Admiralty's full report on suggested organization of bases for assembling American mines is being forwarded. Plan calls for United States base at Invergordon, handling 2,000 mines per week and at Inverness, handling 1,500. Combined personnel required from United States approximately 182 mechanics, 620 skilled laborers, 690 laborers, 40 clerks, and for dock work parties, 45 boatswains mates, 25 coxswains, 400 seamen and ordinary seamen. Most important that all these be enlisted men to insure military discipline and control and to avoid labor complications here. Commanding officers at depots should have rank of commander and each should have five or six other officers as assistants. Large distillery buildings will be taken over, but there will be small amount of new construction required. Shops must be fitted up. Scarcity machinery, cranes, etc., in this country, would make very welcome arrangement of United States could furnish some of these. At least one of officers sent for conference mentioned Opnav 925, should have had experience in manufacture mines in United States navy yards as Naval Constructor Knox has had. Some of depot staffs should come at same time as officers who return after conference, so they will be in touch with work from beginning. Intended ship some mines by Lock Alsh and rail via Dingwall, but ships for Kyle must not exceed 280 feet length nor 20 feet draught. Other mines will come via Fort William and by barge through Caledonian Canal. British Rear Admiral will be senior officer in general charge joint operations, these and British bases in Firth of Forth. Admiralty desires verify immediately understanding that sinkers as well as mines will be furnished from United States. Furnish information concerning general character eight mine layers sailing 1 February and whether any other craft will be used for mine laying. Would also like to learn approximate number and kind of mine carriers. Will reply concerning Old Colony later. For localities mentioned see B. A. charts 115, 2182B, 2167, 2635, 2676, 3547."

In reply to the questions contained in the above cablegram relative to the United States supplying enlisted men for assembling the mines at the bases instead of employing British civilians, the Chief of Naval Operations cabled on November 8 that drafts of approximately 200 enlisted men per week would be sent over as soon as the bases were ready to receive them. Upon receipt of this information the Third Sea Lord wrote Admiral Sims as follows:

"The Admiralty are most grateful and the decision of the Navy Department relieves us of very great anxiety. * * *"

In accordance with the requests of the Admiralty and the desires of the Bureau of Ordnance that American officers who would be associated with the establishment of the bases and their operation should be sent to Great Britain as soon as possible, Commander O. G. Murfin, United States Navy, accompanied by Commander T. L.

Johnson, United States Navy, sailed from the United States on November 13, 1917. The Chief of Naval Operations cabled Admiral Sims on November 18:

"Commander O. G. Murfin under orders to proceed to England. Is authorized to speak for Bureau of Ordnance, discussing all details depot arrangements, machine-shop equipment, unloading and transportation arrangements with British Admiralty representatives, and make decisions in these matters. Commander Thomas Lee Johnson accompanies to assist Commander Murfin in plans and returns here with detailed information."

Commander Murfin and Commander Johnson arrived in London on November 23, 1917, and reported to the commander United States naval forces operating in European waters. The force commander issued orders to Commander Murfin assigning him to be in charge of all matters relating to the establishment of United States naval mine depots in Great Britain and to duty in charge of such depots upon their establishment; he was further ordered to make his headquarters in London during the preliminary negotiations in connection with the bases.

On November 26, 1917, Commander Murfin and Commander Johnson left London to inspect the sites selected for the United States mine bases. They were accompanied by Capt. Lockhart-Leith, Royal Navy, Engineer Capt. Gaisford, Royal Navy, Mr. Heap from the Admiralty's Controller's Office, and Surg. Thompson, United States Navy, from the United States naval headquarters. The party arrived in Inverness on November 27, spent four days inspecting the base sites at Invergordon and Inverness, and the two shipping points at Kyle of Loch Alsh and Corpach, and then returned to London. Commander Johnson left England on December 6, 1917, for the United States.

At the time of this inspection whisky was being removed from the distillery buildings preparatory to proceeding with the work of establishing the bases. At Dalmore sound had been broken for a branch railroad line to connect the distillery with the Highland Railway. Other work was being held up, pending decisions to be made by Commander Murfin. These decisions having been given, plans for expediting the work of establishing and outfitting the bases were proceeded with.

Much of the material for these bases could not be procured in Great Britain, because of the drain upon that country's supplies made by the war, and at the bureau the mine section secured the assistance of Capt. (then Commander) G. C. Schafer, Supply Corps, United States Navy, in connection with providing cranes and equipment of all kinds, assembly of material, and assuring delivery to the mine bases abroad, remaining in Washington until, deliveries being assured, he proceeded overseas in March, 1918, and resumed this work at the mine bases as a member of the staff of Rear Admiral Joseph Strauss, United States Navy, the commander of the operation of laying the barrage.

The Navy Department designated the base at Inverness as base 18, and the one at Invergordon as base 17.

The work of preparing and outfitting the mine bases was done by contract through the Admiralty. The construction work was done under the immediate supervision of the superintending civil engineer. Invergordon Dockyard; and the tools and equipment were supplied through the controller's department of the Admiralty. Rear Admiral Clinton-Baker, Royal Navy, was the admiralty's representative in general charge of the work, and desired alterations or additions to buildings or equipment were ordered on his approval. The construction was somewhat delayed due to inclement weather conditions and to lack of suitable labor; but in spite of these handicaps good progress was made from the beginning. Commander Murfin kept in direct touch with the work by correspondence, by frequent visits to Rear Admiral Clinton-Baker's office at the Admiralty, and by frequent visits to the bases themselves.

The first draft of men arrived in Liverpool on the steamship *Philadelphia* on November 27, 1917. Lieut. Commander Edwin A. Welleson, United States Navy, who arrived on the same vessel, was put in charge of the 37 rated men in this draft, and went with them to the British mine depot at Portsmouth for instruction at the mining school at that place. The remainder of the men in the draft were sent to Queenstown for distribution to the destroyer flotilla, owing to the fact that the bases were not yet ready to receive them.

On December 3 the second draft arrived at Liverpool on the steamship *New York*. Twenty rated men from this draft were sent to Portsmouth to join the detachment there, and the nonrated men were sent to Queenstown, to be held until accommodations could be provided at the mine bases. Lieut. Commander L. M. Stewart arrived in London and reported at headquarters on December 4, 1917, and was sent to Portsmouth to assist with the instruction of the men already there.

Lieut. Thomas Newhall, United States Naval Reserve Force, reported at headquarters in London on December 10, and was assigned to duty as assistant to Com-

mander Murfin. On December 26 Lieut. Newhall was sent to the bases as Commander Murfin's representative for keeping in touch with the construction work.

On January 7, 1918, Lieut. Commander Stewart with 23 men was sent to base 18 and Lieut. Commander Wolleson with 22 men was sent to base 17. These parties arrived at their destination on January 8. These small forces were assigned to the bases to assist in the arrangements for housing the personnel at the bases and to form the nucleus upon which the organization could be started. As the men's living quarters at the two bases were in an unfinished state, the men at base 18 were quartered in the old Muirtown Hotel, which was one of the buildings taken over for base purposes and which was later made into the sick quarters. The men at base 17 were quartered in the residence of the manager of the distillery, which was one of the buildings taken over in the grounds and was subsequently converted into the sick quarters at that place.

Commander Murfin left London January 25, 1918, and arrived at Inverness on January 26, taking direct charge of the work at the bases and establishing his headquarters at base 18 and in the house which had formerly been the home of the manager of the Glen Albyn Distillery.

The United States national ensign was officially hoisted over the office at base 18 on February 9, 1918, and at base 17 on February 12. The raising of the flags at the two bases were made functions at which British civil and military officials, as well as the officers and men attached to the bases, were present and took part.

At the outset the question of transportation appeared to be the greatest problem that would be encountered. The estimated weekly output of mines required for the mine layers was 3,500. The railroad from Kyle to base 17 could only handle about 2,000 mines per week and the Caledonian Canal, running from Corpach to base 18, could transport approximately 1,500 mines per week. This made it necessary to use two bases instead of one large base, for Inverness Harbor could not accommodate the full mine-laying force, nor could the mines going through the Caledonian Canal readily be shipped to Invergordon. Although the bases were separated by a distance of 10 miles by rail and 25 miles by water, no difficulty was encountered in unifying the efforts of the two establishments and coordinating and directing the divided mine squadron anchored in the two harbors.

At Corpach mine carriers anchored in the stream opposite the entrance to the Caledonian Canal. Their cargoes were discharged into power lighters and dispatched to base 18. The work of discharging the cargoes of the carriers into the lighters was done by a detachment of 65 men from base 18 permanently stationed at Corpach. The lighters, owned by the British, were manned by British ratings and their movements were directed by the British senior naval officer at Inverness. After the lighters arrived at the canal quay at base 18 they were discharged by the United States forces at that base.

Vessels arriving at Kyle were taken alongside a small pier and their cargoes discharged directly into railroad cars, thence taken to base 17 via Dingwall. The work of discharging the cargo into the railroad cars and shunting them across to the main line from the pier was done entirely by the 65 men from base 17 who formed the detachment at Kyle. After being placed on the main line, the cars were delivered on the siding at base 17, from where they were again handled by the United States personnel.

The first stores forwarded from the United States were sent via Liverpool, and were received at the bases January 20, 1918: The first mine carrier, U. S. S. *Ozama*, arrived at Kyle of Loch Alsh on February 18, with stores and equipment but no mining material. The second carrier arrived at Kyle on March 21, with general stores and equipment; the third was also routed to Kyle, arriving there April 3, with mine anchors and other mining material. The first mine carrier routed to Corpach arrived April 5, 1918, with mine anchors and other mining material. The first carriers containing mine spheres were the U. S. S. *Ozama*, which arrived at Corpach on May 21, and the U. S. S. *Lake Superior*, which arrived at Kyle on the 29th.

Officers and men reported for duty at the two mine bases from time to time until, on March 30, 1918, there were 18 officers and 414 enlisted men on duty at base 17, and 23 officers and 359 men on duty at base 18.

On March 1, 1918, both bases had reached such a state of completion that mines could have been received and assembly work could have commenced, although operations at this time would have been somewhat handicapped by the fact that a considerable part of the work at the bases was still in an unfinished condition.

By April 1, 1918, the main construction work was practically completed and the bases ready in every respect for the purpose for which they were established. Actual assembly work did not begin until May 29, 1918, the date upon which the first mines were received.

In general, the following work was done at Dalmore in establishing base 17: The distillery was commandeered and taken over; some of the existing distillery buildings were refitted and made into barracks for the enlisted personnel, and others were refitted as storehouses for general stores and mine equipment; buildings were used for work shops for mine assembly, for storage of mines and mine material, both in assembled units and in component parts; railroad tracks were laid in the base on the main line of the Highland Railway and from the base to the pier at the dockyard, Invergordon; wagon roads were built connecting various buildings within the base; fire mains were laid, water systems provided; wash rooms, bathrooms and other sanitary devices were installed; and commissary and messing facilities provided. An electric light and power plant was built, and other necessary equipment and adaptations to a base of this nature were provided.

At base 18 the same provisions were made as at base 17, with the exception of the electric light and power plant—the lighting and power at base 18 being received from the city of Aberdeen.

At Kyle four huts were erected as barracks, mess hall, galley, and storage spaces for the men of the detachment at that place.

At Corpach a large private residence was taken over and converted for use as barracks, mess hall, galley, and storehouse for that detachment.

After unloading the mine parts from the railroad cars at base 17 or the lighters at base 18, the various parts were sorted and placed in bulk store. These stores were, in general, adjacent to the assembly sheds, so that miscellaneous parts could be readily supplied as required.

The work of assembling the mines was a highly organized process developed in accordance with the present standards of manufacturing efficiency, wherein each man performs one specific task over and over again as the mines are moved along in front of him for the various stages of assembly.

As soon as the commanding officer of the bases was informed of the quantities and types of mines which would be required at each base for the mine layers, the work of assembly began. The various component parts for the mines began to pour into the assembly sheds from the bulk storage rooms. The two principal parts constituting the mine were the anchor and the mine sphere. As the anchors arrived they were placed upon assembly tracks extending across each bay. Along these tracks were stationed groups of men, each group making some special adjustment, testing the rake tension, release mechanism, etc., as the anchor was rolled along the track. By the time the anchor reached the end of the track the mine case, which had at the same time undergone preparation and testing while moving along a traveling table, was completed, and the two parts were ready to be married to each other. This done, a few final adjustments were made, and the mine was ready to be placed on board a mine layer. From here the completed mines were either rolled into ready-issue sheds directly opposite the assembly bays or else were loaded directly into railroad cars to be sent to the ships.

From the railroad cars the assembled mines were carried back to the canal siding at base 18 or to the dockyard at base 17, where they were loaded into barges. The barges carried from 50 to 60 assembled mines and were towed out to the ships and placed alongside while the ship's crew whipped the mines aboard and stowed them on the tracks ready for planting.

The original estimates prepared by the British as to the rate of transportation from Kyle to base 17 and from Corpach to base 18 were far below that actually accomplished. The rate of assembly and the possible rate of planting mines also much exceeded the original expectations. Therefore, the rate originally fixed for shipping 3,500 mines per week from the United States was increased to 6,000 per week. In spite of the greatly increased amount of work in assembly which developed on account of defects discovered in the actual mining, the rate of assembly at the two bases was increased from the original estimate of 500 mines per day to as high as 1,340 mines per day. Similarly, the time required for the mine layers to refuel, take on water, embark mines and necessary supplies had been so systemmatized that only two days in port were necessary before they were ready for the next excursion. This made it possible to carry out excursions every four or five days, depending upon the distance it was necessary for the vessels to proceed in order to lay their mines. As will be seen, delays almost heartbreaking occurred which kept the squadron in port from two to three weeks between excursions. While none of these delays could be foreseen, the mines from the United States continued to arrive until the storage facilities were most severely taxed. The original plan of the bases called for a total storage of 12,000 mines at both places. At one time as many as 20,500 had accumulated. Wise foresight, however, on the part of the commanding officer of the bases had made it possible to stow them all under cover, protected from the incessant rain of northern Scotland.

The headquarters of Rear Admiral Joseph Strauss, commander mine force, and Capt. Murfin were at base 18. The two mine bases were so organized that there were two executive officers, representatives of the commanding officer, in complete charge of all administrative and industrial activities at their respective bases. Each base was organized with military, industrial, supply, medical, and transportation departments.

The industrial officer was responsible for the assembly of mines, which work was organized along lines similar to those obtaining in automobile plants in the United States. The various component parts of the mines were received and stored and inspected preliminary to assembly separately. In the assembly process, the major parts, the mine case and the anchor, moved along on small trucks on rails, the various minor parts being assembled progressively, to a point where the mine case and anchor were "married" together, and thence placed in the "ready-for-issue" stock or loaded into cars for delivery to the mine layers. This system, under which separate groups of men, highly specialized, performed the same function for each mine case and anchor, proved most efficient and produced results never before attained in the rapid handling of mines.

Admiral Mayo, Commander in Chief Atlantic Fleet, inspected the bases September 25-27 and October 5-7, 1918, and reported most favorably on their condition. Quoting from his report: "The personnel throughout, both commissioned and enlisted, appeared to be satisfactory as to number and selection; their military appearance, bearing, and uniform made a favorable impression. The men are granted liberty freely and the relations with the natives of the towns and surrounding country appeared to be excellent." Quoting further: "Owing to the relatively late start of the operations, it has been necessary for the entire force, ashore and afloat, to work at high pressure in order to complete the original and later plans before bad weather sets in. The response of the personnel has been excellent and is considered indicative of a highly satisfactory state of morale."

Admiral Mayo concluded his report with the remarks:

(a) "The arrangements in force are remarkable for their conformity to the plan prepared at home before the mine force crossed the Atlantic."

(b) "The inspection of the mine force and bases and of the activities in connection with the work incident to mine laying in the North Sea, revealed a highly satisfactory condition and reflect great credit on the commander mine force and on his assistants."

CHAPTER XI.—ORGANIZATION OF MINE SQUADRON AND SELECTION OF NEW MINE PLANTERS.

Prior to the decision to proceed with the northern barrage project, the mine force of the United States Navy included only two mine layers fit for the project, the *San Francisco* and *Baltimore*. This force possessed very small mine-laying capacity, and it became necessary, as one of the first steps in preparation for the project, to greatly enlarge the force by taking over a sufficient number of merchant ships and converting them into mine layers; to obtain and train the officers and crews for these vessels, and to secure the requisite merchant tonnage for transporting the mines and other material to Europe.

On the basis of an estimated output of 5,000 mines a week and of one mine-planting operation a week, the department concluded that the mine force should have a capacity of at least 5,000 mines ready to plant, which, if all went well, would insure the planting of the northern barrage in three months.

The *San Francisco* and *Baltimore* had a combined capacity of only 350 mines. It was necessary, therefore, to create practically a complete new mine squadron to secure the requisite capacity. Vessels were desired of ample size, yet handy in tactical formation; serviceable condition as to engines, boilers, pumps, etc.; good cargo-handling equipment adaptable for handling mines; internal arrangements suitable for installation of mine tracks on two or three decks; speed of 14 to 20 knots and generally seaworthy. From data on file in the Navy Department it was found that four vessels of the Morgan Line, running between New York, New Orleans, and Galveston, were generally satisfactory for the purpose. They had been built by the Newport News Shipbuilding Co. to replace vessels of the *Prairie* class, purchased by the United States Navy in the Spanish-American War, and were in good condition. They were 391 feet long, 48 feet beam, and 20 feet draft when loaded as mine planters. They were capable of a sustained sea speed of 14.5 knots and had ample bunker capacity. Their capacity was estimated at 800 to 850 mines each.

The Secretary of the Navy personally informed Mr. Hurley, president of the Shipping Board, about the projected barrage operation; and the department's request for the four Morgan liners was promptly granted, notwithstanding the prevailing dearth

shipping and despite the fast-mounting demands for tonnage. The vessels were turned over to the Navy as soon as they had discharged the cargoes then on board or dinged. The first taken over, the steamship *El Dia*, renamed *Roanoke*, was delivered November 16, 1917, at Tietjan and Lang's shipyard, Hoboken, N. J., where work of conversion into a mine planter was promptly undertaken. *El Rio*, renamed *Housatonic*, followed at the same yard November 25; and *El Siglo* and *El Sol*, becoming the *Canandaigua* and *Cononicus*, respectively, arrived at the Morse yard, South Brooklyn, November 22 and 24.

Some high-speed vessels were desired for the mine force, but there were few such vessels under the American flag. On the Atlantic coast there were only three of suitable size and build, one of which, the *Old Colony*, had been promised to the British Navy; The others were the *Massachusetts* and *Bunker Hill*. These last two were taken over by the Navy, were renamed the *Shawmut* and *Aroostook*, and were delivered at the navy yard, Boston, November 6 and 10, for conversion. These vessels could each carry about 300 mines on one deck. They had a speed of 20 knots and a very short steaming radius, about 2,300 miles at economical speed.

Two more vessels, the *Jefferson* and *Hamilton*, of the Old Dominion Line, plying between New York and Norfolk, were requisitioned by the Navy and taken over November 2 and 6, 1917. They were renamed the *Quinnebaug* and *Saranac*, respectively, and the work of conversion was undertaken at Robbins repair yard, Erie, Pa., and James Shewan & Sons' repair yard, both in South Brooklyn. Their speed was about 16.5 to 17 knots and their capacity 600 mines each, carried on two decks.

Thus, a total of eight vessels were acquired for conversion into planters, which, with the *San Francisco* and *Baltimore*, formed a squadron of 10, with a total capacity of about 5,500 mines.

The conversion of the Morgan mine layers (*Roanoke*, *Housatonic*, *Cononicus* and *Canandaigua*) was an undertaking of extensive detail. It involved enlarging the forward or top deck; making a reserve bunker in the hold forward of the boiler room; replacing the existing upper bunkers, which were cleared off the third deck; making a separate compartment in the hold for the elevator pumps, and rearranging smaller compartments for the dynamo room and machine shops; closing the cargo ports and providing chutes for coaling over all with mines on board; cutting stern ports for launching the mines through, and raising the rudder quadrant to give the needed clearance; repairing (largely renewing) and reeathing the second and third decks; enlarging the officers' quarters to accommodate the more numerous naval complement; providing commissary, messing, and berthing arrangements for a crew of about 200, including bakery, scullery, and a naval galley—no easy matter with the large amount of interior space to be reserved for the mines; building storerooms, magazines, water tanks for storage and distribution, washrooms, and closets, installing a fire system and magazine sprinklers; replacing the anchor engine and windlass with one of more power to handle larger chain and heavier anchors, stowing on billboards; on deck, building gun platforms forward and aft, lookout stations, and navigating and signal bridges, together with speaking tubes and accessory apparatus for fire control and other communications; making and altering hatchways for crews' use and for mine handling; altering boat stowage and davits for heavier boats; and installing davits and booms for embarking mines. Watertight subdivision far below the ordinary naval standard had to be accepted, on account of the limited time available; but some improvement was effected by making existing bulkheads stronger and, with their openings, watertight where possible, and by building two new bulkheads, one forward and one aft, to divide the largest compartments, so that the ships would have a chance of keeping afloat, if only one compartment were flooded.

On the main machinery, the work to be done was chiefly overhaul and repair; but to the auxiliary machinery much had to be added. The electric plant was more than doubled. An evaporator and distiller for fresh water, special hydraulic pump installation for the mine elevators, refrigerating machinery, a larger radio-telegraphy plant, a considerable number of additional winches for embarking and handling the mines, a steam heating system, and a machine shop were all new.

The provision of adequate ventilation was a problem. In these cargo ships it was entirely lacking where the crew were to be. In the region where the ships were to operate, keeping the large hatches constantly open for airing out below decks could not be counted upon. In the crowded condition that would obtain when the ships were at sea with mines on board, considerable supply of fresh air and exhaust for the foul was very important to ordinary comfort, as well as for the prevention of possible spread of respiratory infection. The principal difficulty encountered was to obtain ventilating blowers in number and capacity to meet the minimum requirements. In this respect the conversion of these ships was least satisfactory.

The two Old Dominion liners (*Saranac* and *Quinnebaug*) required somewhat different treatment in conversion. Their state of preservation was comparatively poor, and their original construction, in general and in details, much inferior to that of the other ships taken. A considerable part of the light upper passenger decks had to be removed, the parts retained strengthened by extra side plating and interior stiffening. Their general arrangement as mine planters, however, differed from that of the *Merza* Liners only in detail and in their carrying mines on two decks only, instead of three, with correspondingly fewer elevators. The extra space above the main deck made a better provision possible for officers and chief petty officers, with consequently more room for the men below, and gave better ventilation generally; but the additional height above water was otherwise of no advantage. The single, low mast, which was all they had at first, was afterwards lengthened by a topmast, to give the necessary hoist for signals and radio.

In common with all other ship alterations in hand at the time, the original plan had to be based on what could be done within a reasonable time with material and labor scarce. There was no available data for mining installations on the scale we had undertaken. Some British mining memoranda were received, and later a few blue prints from some of their plans. Also, Lieut. De Salis, R. N., placed all his experience at our disposal. But as other nations had not made a success of mine elevators or gone in for mine carrying capacity to the same extent we had, little of their data proved applicable. The experience of the *San Francisco* and *Baltimore* during the past two years, however, was invaluable, enabling the decision of many questions of detail, both before and during the conversion, to be made with confidence that subsequent results confirmed as well founded.

The plan finally arrived at for the mining installation of the new ships consisted of two tracks for mines on each side of the second or launching decks, extending about three-fourths the length of that deck. On the deck below there were likewise two long tracks; and inboard, aft, four or more short stowage tracks. In addition to these the four large minelayers—*Roanoke*, *Housatonic*, *Canonicus*, and *Canandaigua*—each had stowage tracks on the enlarged forward or top deck. Cross tracks and turntables connected all tracks at points sufficiently distributed to insure against a breakdown at any point cutting of the mines beyond. Mines were transferred from the lower stowage decks to the launching deck by elevators. This was a unique and typically American feature of these vessels. Elevators had been abandoned by other nations as impracticable. After considering various possible methods of transferring mines from the lower decks to the upper decks so as to permit the whole cargo of mines to be launched in one continuous string, the elevators were chosen in preference to launching from two decks, or to installing inclined planes, conveyor machinery, or ordinary whips and trolleys. Rather than attempt to design a new elevator, the representatives of the Otis Elevator Co. were called in at the outset and informed of the requirements. These representatives stated that they would meet the necessary requirements, which was more than borne out in the actual installation. The elevators were of two types—electrical and hydraulic—with automatic stop and levelling devices, capable of carrying two mines and designed to make a round trip in one minute, including the time of loading and unloading the car. This rate was eventually doubled in use.

On the four large layers there was only room for one launching port on each side of the deck. It was therefore necessary to install a switch so that the mines on the two tracks on each side could be planted from their respective ports without using a turntable. This was also a novel feature which had been abandoned more or less as impracticable by the British, but which gave most excellent service as installed. On the other four new mines planters there was sufficient room aft to cut four launching ports—one for each track—thus eliminating the necessity of switches. The *San Francisco* and *Baltimore* had but one port each, and, due to the limited space, it was impossible to install another. All ports were closed by a substantial watertight door, the section of track in its wake being hinged back when the door was closed.

In the process of planting, the mines on the lower decks were brought forward to the elevators; hoisted to the launching deck; then hauled aft to the launching trap after those originally stowed on the launching deck had been planted. To haul the mines along the tracks, they were made up in "fleets" of 20 to 40 mines, and moved by means of a wire rope rove around a "bogie" attached to the end of the last mine anchor and thence led to a winch. To keep the mines moving at the necessary speed on all sections of the track required an installation of as many as 13 winches on the largest mine planters. As the mines arrived near the launching trap, the "bogies" were disconnected and the mines were run aft into the trap by hand. The trap consisted of a simple lever device, designed to release one mine at a time, allowing it to roll

erboard along the slanting section of the track extending through the launching

The mines were embarked from the upper decks, using the regular cargo booms or cranes specially placed for the purpose. Small hatches were cut for embarking the mines so they could be struck down one, two, or three decks, and landed on tracks on which they could be run to their stowage positions. By this method it was possible to embark mines simultaneously at four points with such speed as to load the largest layers in less than five hours.

Shortly after the ships had been taken over and sent to the various shipbuilding yards for conversion, the commanding officers and executive officers were ordered to their ships to hasten the work by keeping in constant touch with the various items in which least progress was being made. About Christmas the *San Francisco* and the *Baltimore* were sent to the navy yard at New York for their final outfitting before sailing for Europe.

The *Shawmut* and *Aroostook* having been constructed mainly for navigation between Boston and New York by the inside route, there was doubt of their structural strength in the open seas. Thorough examination showed that their steel hulls, though of shallow depth, were well built, requiring no underwater strengthening, and that by doubling the main deck stringers and sheer strakes, running a light plate deck and stiffening the structure above the main deck, in order to secure longitudinal stiffness, they could be made thoroughly seaworthy. These ships, of 4,500 tons displacement, 155 feet long, 52 feet beam, 18 feet extreme draught, were twin screw, oil-burning, of 16 knots speed with possibilities under naval management and good fuel of making 21 or more. They could readily be given a fuel capacity of 4,000 miles at 10 knots and 1,000 miles at 20 knots. Through unremitting efforts, in view of the tactical value of these ships as a fast wing in general mining operations or for "repairing fences" after such operations, they were taken over November 6 and 10, purchased outright, and their alteration begun. The objection to the inclusion of these ships in the force was directed against their seagoing qualities and the extent of the work required to convert them. This conversion meant stripping them down to the main deck and rebuilding upward from that point, for, as passenger ships, their entire upper structure was of wood.

The *Shawmut* and *Aroostook* were placed in commission at Boston Navy Yard, December 7, 1917, and the assembling and organizing of their crews proceeded concurrently with their conversion. Upon removal of the superstructures, the crews were scattered to available spaces in yard shops, and subsisted temporarily on various ships. This continued during a most severe winter with the thermometer many degrees below zero while the work was in progress. The men were finally transferred to temporary quarters on a hospital barge moored nearby. The ship's officers were established in a part of the removed superstructure landed on the dock alongside. This included the pilot houses, in which the officer of the deck was located. The captains organized their crews in industrial gangs for structural work, as well as for their duties in the ships. These gangs were made up chiefly of members of the crews who had had previous experience in the industrial trades of riveters, caulkers, ship-fitters, carpenters, and were placed in charge of officers who had a knowledge of structural steel working. They conformed strictly to yard hours, including overtime—a normal condition—except that for their overtime hours, the enlisted men received no additional pay.

Both ships were completed the same day, June 10, 1918, and in all respects so thoroughly that only six days later they sailed for Scotland.

CHAPTER XII.—TRAINING THE PERSONNEL AND COMMISSIONING THE SHIPS OF MINE SQUADRON ONE.

The sudden expansion of the mine force from 2 mine layers to 10 entailed a proportionate expansion of mining personnel, which offered considerable difficulty. In comparison with the projected Northern Barrage operation, the United States Navy had had very little experience in mining, and this experience was confined to a very few officers and men. It was partly for this reason that the Bureau of Ordnance designed the Mark VI mine in such a manner that it could be handled on board ship practically as "fixed ammunition", so that a minimum of experience and training of the ships' crews would be necessary to its successful use.

The officers and crews of the *San Francisco* and *Baltimore*, together with selected officers and men who had had previous experience in our small mine force, afforded a nucleus around which to build up, and with which to train, the new force, and this last most important work was promptly taken up.

In October, 1917, when the Northern Barrage plan assumed definite form, the *Dubuque*, which had belonged to the force but which was too small to be of much use in extensive mining operations, was in use as a training ship at Annapolis; and the tugs were temporarily attached to the train, Atlantic Fleet, leaving only the *San Francisco* and *Baltimore* for work in connection with preparations for the barrage operation.

On the request of the Bureau of Ordnance, the *Baltimore* was detailed to carry out certain practical experiments involved in the evolution of design of the Mark VI mine. Thus the *San Francisco* was the only vessel wholly available for the training of men for the crews of the new mine planters.

One of the first measures taken to train the new personnel was the establishment by the Bureau of Navigation of a mine force training camp at Cloyne Field Barracks, Newport, R. I., a part of the cantonments provided for the second district Naval Reserves. Accommodations were provided here for 1,050 men, who were subsisted and carried for pay locally but were under the commander of the mine force in other respects. This camp was established on November 11.

The officers who were detailed to conduct the training at this camp had had duty in mine ships. The men for each of the new ships were grouped under officers of their respective ships. As the ships went into commission their crews were withdrawn from the training camp. Capt. Belknap, in his *History of Mine Squadron (One)*, gives the following account of the training of the crews and the commissioning of the new ships:

The training was general, including seamanship, mines, gunnery, signals, infantry, and boats. For five weeks the *San Francisco* and *Baltimore* were present, giving practical instruction and experience in mine handling. A part of their regular crews were transferred to the barracks and replaced by new men. These would be on board for a week or 10 days; then another lot would come. There was not time to cover all men in this fashion, but it was expected the information picked up would spread. During the summer of 1917 a detail of 150 reserves, later increased to 400, had been sent from Newport to New London, Conn., to work with the mine force on antisubmarine net making and planting. The work being completed, a considerable number of the first 150 were obtained for the new mine ships. Along with the net making they had been given a regular and systematic training by the *Dubuque's* officers, which was now to prove of direct benefit in the mine force. During this training-camp period at Newport the weather was at times biting cold, but the results were well worth while. The *Sonoma* and *Ontario* helped at this time in practical seamanship, signals, and quartermaster training until withdrawn to assist the Shipping Board to get vessels out of the St. Lawrence River ice. The *Patapsco* and *Patuxent* carried on the same work after completing repairs, about February 1 and March 1, 1918.

For radio instruction a class was established in mid-November on board the *San Francisco*, consisting of likely material from the training camp. When the *San Francisco* went to Shewan's yard, December 18, 1918, her radio force was largely augmented by the best men from this class, and instruction was continued during her overhaul. This included visits to shops and to the radio laboratory at the navy yard, Brooklyn. The remainder of the original class continued instruction under one of their own number at the training barracks. When the *San Francisco* was about to leave Shewan's yard early in March her excess radio men were distributed among ships fitting out in New York, to assist with the installation of their equipment and become familiar with it. Later, when the squadron assembled, training in British procedure was taken up, enabling the squadron radio force to adopt it within a day after arriving in Scotland.

For instruction in signals, especially British, flags, and procedure, a class was formed at Newport January 29, to which signal quartermasters and signalmen from all ships were sent for about a month's training. To these 50 more were added from the signal class at the Newport training station. All were divided into groups by ships and given an intensive course in all kinds of signaling and quartermaster duty. Capt. E. H. Campbell, commanding the Newport training station, placed all desired facilities at the disposal of the force, and for practice afloat first the *Patapsco* and then the *Patuxent* also were available. The value of this preliminary instruction was later demonstrated by the excellence of the signaling during the mining operations. Great credit is due to the leading chief quartermaster, William H. Kerens, of the *San Francisco*, and the other chiefs for the quick and accurate communication by signals which they made possible.

The importance of a well organized and trained lookout service was early given attention, resulting in an excellent arrangement of stations, communications, and procedure.

For various reasons the full number of 1,050, for which training-camp accommodation had been provided, was at no one time complete, but the training was supplemented elsewhere, so that few if any wholly untrained men were received by any ship. As soon as she was ready for them, three gun crews trained in the battleships were drafted to each ship. Similarly the engineer department personnel were assembled at Philadelphia and kept under training until wanted. The quotas of experienced petty officers, artificers, and lower ratings began to be assembled on board the receiving ship at New York in January, but the constant demands from her quarters interfered much here. Permanent association of men with ships on a satisfactory basis hardly began much before the ships went into commission.

For the officers similar measures were taken to put them in touch with the methods and the results of experience in the mine force. A conference of all new commanding officers and executives with Capt. Belknap and Commander Butler was held on board the *San Francisco* in Newport on December 3, at which the operation in hand was described, along with the doctrine and other matters peculiar to the force and to the particular service of the ships. The mine force training instructions were reprinted and issued. Matters pertaining to training and organization were taken up at the subsequent conferences held at New York and Boston, through the winter, and though the ships were as yet neither assigned to the mine force now in commission, the acting commander mine force, Capt. Butler, sent them for guidance copies of all orders and instructions likely to be of useful information. In addition, the mining officers were given practical instruction on board the *San Francisco* and *Baltimore* in late November, and during the mine experiments conducted by the *San Francisco* in the spring in Chesapeake Bay, at Newport and off Cape Ann.

The association of the new ships' officers at New York with one another and with those of the *San Francisco* and *Baltimore* during January and February made for good progress in working out the organization and future procedure on board the new ships during mine planting. Study of the blue-print plans made the officers fairly familiar with the ships' installations, so that by the time they moved aboard and began actual drills and try out, much of the preliminary work had already been done. To facilitate the early establishment of routine on a regular basis so that time might sooner become available for specially training, the *North Dakota's* routine book was revised so as to be suitable for the new mine planters, its adoption in whole or part, however, being optional with each commanding officer.

The first ships to be commissioned were the *Shaumut*, Capt. W. T. Cluverius, and *Brookstock*, Commander J. H. Tomb, at Boston December 7, 1917. Their crews had been built up and organized comparatively early, their own labor considerably hastening the completion of the ships, as told elsewhere. The popularity of their respective service was a great stimulus. Many applicants of all ratings from ships visiting the Boston yard, keen to go across on the mine-planting expedition, volunteered to the captains of these two ships.

Next to commission were the *Roanoke*, Capt. C. D. Stearns, and *Housatonic*, Commander J. W. Greenslade, on the 25th of January, 1918. Conditions in the neighborhood of their shipyard and on board the ships made an earlier date impossible without retarding their conversion. Living conditions were extremely rough amid the dirt and disorder, made worse by the slush and mud in the unpaved shipyards; but the presence of officers and men on board exerted constant forward pressure on the work, while they at the same time were becoming acquainted with the details of their ships. At the Morse yard conditions were not favorable for commissioning until March 2. The decision of the appropriate time for commissioning was left to the respective commanding officers, who, watching the work's progress from day to day, were in the best position to choose. The *Canandaigua*, Commander W. H. Reynolds, and *Yanonicus*, Commander T. L. Johnson, commissioned March 2; the *Quinnebaug*, Commander D. P. Mannix, not until March 23, but most of her crew had been assembled, organized, and accustomed to the ship from a much earlier date. Last to commission was the *Saranac*, Commander Sinclair Gannon, April 9, 1918.

CHAPTER XIII.—COMPLETION AND SAILING OF MINE SQUADRON.

The date of departure of the mine squadron had been fixed tentatively at February 1, 1918, partly because it was believed originally that this program could be met if all went well and partly because it was feared that other work no more important might be given precedence. It was soon found, however, that the date for completion would have to be postponed because of unavoidable delays, and consequently February 24, March 15, and March 21 were successively worked for.

Throughout December to March crowding in the shipyards, scarcity of material, congested transportation, shortage of fuel, and severe weather made a con-

of difficulties especially unfavorable for outside work on the mine planters, of which there was a good deal to be done. By constant urging, anticipating probable cause of delay, and persistently following up behindhand deliveries, the work as a whole kept always progressing, if at times slowly. Work on the Morgan liners was undoubtedly helped by having them in pairs at two shipyards, a good arrangement for mutual assistance and emulation; and, as the time for completion drew near, a spirit of competition was aroused between the managers of the two yards. On the other two ships at New York, which were placed singly, the *Saranac* at Shewan's yard was greatly delayed by some apparent disaffection among the shipyard employees and by partial strikes. Special measures had at last to be taken in her case, finally getting her to sea six weeks behind her sister, the *Quinnebaug*.

A great deal of the delay was undoubtedly due to lack of interest on the part of workmen. The subsequently successful campaign of addresses to the workmen by good speakers, explaining the need for the ships and the men's own interest in doing their best, did not begin until some time in February, and then only in a small way. Another serious retarding cause, constantly present, was insufficient supervision of the work. The contractors were new to Government work, the vessels were of a type for which no model existed, and plans were not forthcoming as fast as wanted, nor often in the logical order. Several delays or losses of material in transportation held up other work, and one of the trades—ship fitter—in which labor was shortest was the one on the completion of whose work much of the other work was dependent. Finally by the end of the first week in April five ships had been sufficiently completed to leave the shipyards and go to sea. Yet these ships, which with the *San Francisco* and *Baltimore* represented three-fourths of the total mining capacity, late as they were, were not behind the time the mines were ready, the manufacture of these likewise having suffered from the prevailing unfavorable industrial conditions.

First away from the shipyard, April 4, 1918, was *Roanoke*. She had been the first of the Morgan liners taken over, but to get her away even then it was necessary to take her to the Brooklyn Navy Yard for a few days to concentrate on her electric wiring. Several items were incomplete, but a break had to be made away from the shipyard, and it did not become necessary to send her back. The *Housatonic* followed close afterwards, April 6, similarly incomplete; then *Canandaigua* April 8. The latter had a long list of unfinished or poorly finished items, including the ice machine and partial installation of the ventilation system. *Quinnebaug* and *Canonicus* on April 14 and 16, respectively, made a total of five ships ready about the same time. Among these the shortest time under alteration was 4 months and 12 days; the longest 4 months and 24 days.

A tentative schedule prepared by the British Admiralty in the early part of December, 1917, named May 1 for the completion of one system of the mine barrage, allowing one month to do the mine planting. Subsequent events made that date impossible to meet, in spite of all efforts; but the ships' officers were doing all they could to advance their preparations for active service without retarding the work of the shipyards, so that when the vessels did leave, they should be coaled and stored as completely as the state of supply market permitted. A memorandum had been issued to them on February 28, outlining the tentative employment of time prior to going across, as follows:

(a) On leaving the yard, each ship was to drop down to Gravesend Bay to receive 50 Mark IV mines to be used for training; these to be turned in before departure for abroad.

(b) Each ship was to proceed to sea independently for one week, for a shakedown, general clean up, and preliminary ship drills, finishing the cruise at Hampton Roads. At discretion, ships were to go into Chesapeake Bay for part of the time, keeping clear of the rest of the fleet.

(c) One week was to be devoted mainly to training in mining, first taking half of the ship's capacity on board, for working out the handling of winches, parbuckles, fleets, elevators, and cross-overs. During the following week, enough more mines were to be taken to fill to capacity, less one track load on each side of the launching deck. This was afterwards changed to leave one deck clear of mines, to make room for extra men carried to fill the mine bases. At the end of two weeks, two to four days were to be spent in coaling, completing with stores, and other final preparations.

(d) On the passage across there were to be tactical and gunnery exercises and ample opportunity for moving mines about as desired for training on board.

The final aim was to arrive at destination ready, after loading with mines and coal, to begin planting. It was estimated that 45 days after leaving the shipyard would suffice for the completion of this whole program. The squadron was, therefore, working without a definite date but within a definite lapse of time. Its arrival at the mine bases in Scotland, during the night of May 25-26, was on the fortieth day

at the time the last ship left the shipyard. On arrival all were ready, requiring only coal and mines.

Having completed her final fitting out and conducted successful experiments with the new mine in Chesapeake Bay, March 13-15, in Narragansett Bay March 21-21, and Cape Ann April 1-5, the *San Francisco* returned to Hampton Roads; and there, on Wednesday, April 10, 1918, Capt. R. R. Belknap having been detached from the office of Naval Operations, assumed command of the mine squadron, with additional duty as chief of staff to the commander of the mine force. Rear Admiral Joseph Strauss, who had already proceeded to the mine force headquarters at base 18, Inverness, Scotland.

On April 12, 1918, the first of the new mine planters, the *Roanoke*, stood into the Roads, followed the same day by the *Housatonic*, and the next day by the *Canandaigua*. Immediately upon arrival, these vessels proceeded to take their complement of mines from the mine carrier *Lake Superior* and Southern Railroad Pier No. 4 at Minners Point.

So far, all had gone smoothly; but early Monday morning, the 15th, the *Housatonic*, getting under way from Pier 4 broke the side of her hot well casing, completely disabling the main engine beyond repair in less than 10 days. The work was taken in hand immediately by a force from the Norfolk Navy Yard, and at noon Tuesday she was towed to the yard, where every effort was made toward early completion. There was no choice but to wait and take advantage of the time in completing and improving such work as had not been done to satisfaction at the ship yards. In this respect the enforced delay was a benefit, as some navy yard help was given other units too, which relieved the small repair gangs of the ships from a discouraging amount of pressing work, hopeless of accomplishment unaided.

It became evident by Thursday the 18th that the unfinished items on board *Canandaigua*, which was the worst of any vessel in this respect, could not be completed without navy yard help by the time the *Housatonic* would be ready. The commandant at the Norfolk yard was applied to that night by radio, and he and the officers of the industrial department, appreciating the urgency for getting this force off for the war zone, promptly took in hand every item of unfinished work that could be completed simultaneously with the work on the *Housatonic*.

On Wednesday afternoon the *Quinnebaug* stood in, and on Saturday, April 20, the *Canonicus*, both reporting themselves ready, making the squadron for the time complete. Except the *Roanoke*, no ship had taken advantage of a full week for preliminary shakedown. The last two ships took only three and four days. All of them, however, experienced bad weather which tested their seaworthiness rather severely for so early in their new career.

It has been planned to supplement the preliminary specialty training of these new ships by giving them the assistance of experienced petty officers and men from the *San Francisco* and *Baltimore* during the two weeks period before sailing for abroad.

An urgent request had come from the British Admiralty about March 1, however, for the services of one or two mine planters to help out in planting a field in the North Channel to the Irish Sea, using British mines. The *Baltimore* was sent in response to this, sailing March 7, via Halifax. Consequently a double burden fell upon *San Francisco* alone, of testing the completed mines and giving some assistance to new ships in their training. Beginning at Hampton Roads, two instruction parties, of experienced gunner's mates, with an officer, were transferred temporarily to the new ships in turn, for practice, instruction, and supervision of all the operations of testing, assembling, and preparing a mine for planting. This was supplemented on deck by sending to some of the new ships one or more experienced signalmen from *San Francisco* in temporary exchange for equal numbers.

A change in plan came about at this time in compliance with the wishes of the commander, mine force, for one or more planters to be sent in advance of the others to assist the *Baltimore*, so that they might together complete the mine field, on which *Baltimore* alone was engaged, in time to join the squadron from the northern barrage operations. For such an early departure the *Roanoke* was the only one that could be considered: Capt. Stearns declared his ship would be ready to proceed as soon as some practice had been given in actual mine planting. Inspection of the crew and ship by the squadron commander confirmed this. Held only 16 days after leaving the shipyard, the inspection showed that the time had been utilized to the best advantage, the crew and the ship throughout being in a state most creditable to Capt. Stearns and his officers and crew.

The following Monday *Roanoke* held some mine planting exercises off Cherrystone, Va. Returning that night, she transferred to other ships all but 160 mines, retaining these for drill, and at noon on Wednesday she sailed, the first of the new mine planters to proceed on active service. At Newport, R. I., she received a draft of 250 men for

the mine bases in Scotland, proceeding thence via New York for the Clyde. As it turned out, all this was fruitless except for getting the men to the bases. The *Roanoke* was detained a few days in New York, waiting to join a convoy, and after arrival in the Clyde took no part in the *Baltimore's* mining operation, although prepared to do so. She arrived at naval base 17, Invergordon, Scotland, a week before the rest of the squadron.

By Friday, April 26, as promised, *Housatonic's* repairs were completed, and she went alongside the *Lake Superior* at the explosives anchorage to obtain her loaded mine cases. Next day at noon the *Canandaigua* did likewise; and by *Housatonic's* working all Saturday night the squadron was at last ready for its first cruise in formation at sea.

The four seagoing tugs, *Sonoma*, *Ontario*, *Patapsco*, and *Patuxent*, which had for some years past been performing the duties of fleet tenders, and for some months after the outbreak of war been engaged with the mine force in submarine net planting and in mining experiments, were fitted out to accompany the mine force abroad. The *Patuxent*, Lieut. J. B. Hupp, commanding, and the *Patapsco*, Lieut. W. S. Benson, were temporarily detached to escort a convoy of submarine chasers abroad via Bermuda and the Azores to Brest, but finally arrived at United States Naval Base 18, Invergordon, Scotland, June 24, 1918, where they were subsequently employed for inspection and observation of mine fields and for communications between the mine bases. The *Sonoma* and *Ontario* remained with the mine planters until their departure for Europe. The *Sonoma*, Lieut. J. S. Trayer, accompanied the mine squadron on its trip across. The *Ontario*, Lieut. Edmund Delavy, accompanied a group of submarine chasers abroad and was then diverted to Queenstown for submarine patrol duty. Although it was originally intended to have 16 tugs, including the 4 above mentioned, attached to the mine squadron as mine sweepers, it developed that their services in this capacity were not needed. Two tugs were able to handle the miscellaneous work at the bases; and, in view of the valuable wrecking equipment on the *Sonoma*, she was released on July 11, 1918, and ordered to Queenstown, where she could be more profitably employed.

Sunday morning, April 28, Mine Squadron One, consisting of *San Francisco*, *Quinnebaug*, *Housatonic*, *Canonicus*, and *Canandaigua*, got under way for Provincetown, Mass., where standardization trials and mine tests were carried out. On Monday, May 6, the squadron proceeded to Boston, where Mark IV drill mines were landed and the quota of Mark IV mines intended for the *Shawmut*, *Aroostook*, and *Housatonic* were disembarked. That same night the squadron got under way for Newport, R. I., the point of final departure, conducting subcaliber practice and tactical exercises en route. The remainder of the week was spent in fueling and provisioning the ships and making final preparations for departure. A draft of 500 men destined for the mine bases in Scotland was distributed among the four large mine layers. The fuel ship *Jason* loaded with aviation stores destined for Killingholme, England, was ordered to cross in company with the mine squadron.

At midnight, May 11 and 12, the squadron, consisting of the *San Francisco*, flagship *Housatonic*, *Canonicus*, *Canandaigua*, *Quinnebaug*, and *Sonoma*, got under way for bases 17 and 18. During the forenoon of May 12 the *Jason* joined the squadron. On the first two days out heavy fog was encountered. The succeeding days were used for gunnery exercises, training and tactical exercises. Wednesday morning, May 15, the *Quinnebaug* showed the breakdown flag. She was taken in tow by the *Sonoma*, the squadron slowing to 7 knots. At the end of 24 hours repairs were completed and the *Quinnebaug* stood on under her own power. May 16 gunnery practice was held on a target towed by the *San Francisco* in which all of the new ships were enabled to exercise their guns. On Friday the wind and sea increased until by 4 o'clock the *Jason* was unable to keep in formation, having to head off the course in long zigzags. Fortunately she had sufficient reserve speed to overtake the squadron when the weather moderated, regaining her position at about 7 p. m. the following day. She was again lost sight of on May 22 during another spell of bad weather. The steering gear of the *Housatonic* broke down on May 21, disabling her approximately for one hour, and again the following day, necessitating reducing the speed of the squadron while repairs were being made.

In the meantime the *Sonoma* was sent on independently. By the original plans she should not have been in company with the squadron but should have turned off several days before to the Azores; but on reaching the separating point, she had proved so seaworthy and useful that it was decided to keep her with the squadron in case of further emergency. In making this decision, the chance had to be taken of bad weather separating her from the other ships on account of her not being able to make the necessary speed or hold the course. She was, therefore, sent on ahead while the rest of the squadron remained with the *Housatonic*. Up to this time the services of the *Sonoma* had been most useful. In addition to towing the *Quinnebaug* while she

was broken down, she was of great use in carrying guard mail between the ships while they were en route and in assisting in the gunnery exercises. On Thursday morning, May 23, the *Sonoma* was overtaken and again joined the squadron. On this day the weather was the worst of any experienced. The wind and sea on the quarter caused such heavy rolling that the *San Francisco* found it expedient to strike mines from the main to the second deck and fill her boiler and engine room double bottoms with salt water to improve her stability. There were no accidents, however, all ships standing the test very well. During the night and early morning the weather moderated, but the fog had set in which continued until noon May 24. At daylight Saturday morning, the *Jason*, missing for four days, was sighted coming astern. Fifteen minutes before the squadron was due at the rendezvous she took her position in the formation, thus making the unit again complete. At 4.52 a. m. four British destroyers appeared out in the haze ahead, then two to the southward and a little later three more to the northward, nine in all with H. M. S. *Anzac*, half leader of the fourteenth flotilla, the flagship. This flotilla escorted the squadron past Cape Wrath, through Pentland Firth and down Moray Firth to Cromarty, where the squadron arrived at 12.40 a. m. Sunday, May 26. Pilots, charts, and mine force instructions were placed aboard the ships at the whistle buoy. The *San Francisco*, *Canandaigua*, *Canonicus*, and *Sonoma*, then proceeded to Inverness Firth and anchored off United States Naval base 18. The *Housatonic*, *Quinnebaug*, and *Jason* proceeded into Cromarty Firth, base 17, where the *Roanoke* was already lying. That forenoon, in reporting to the commander mine force, the squadron commander reported that all ships were ready for their intended duty.

The remainder of the squadron, consisting of the *Saranac*, *Shamut*, and *Aroostook*, cleared the yards where converted on May 23 and June 10, respectively. They were not delayed by uncompleted work, as the others had been; but the standardizing runs over the Provincetown course proved that the *Shamut's* and *Aroostook's* fuel consumption was much larger than had been reckoned, making their fuel capacity insufficient for the passage across. This threatened an indefinite delay, but the difficulty was solved by Capt. Cluverius and Commander Bulmer securing enough oil hose for the *Black Hawk* to fuel the ships at sea. By expeditious management, the three mine planters, together with *Black Hawk*, were able to sail in company on June 16. The only oil hose obtainable quickly was of 4-inch diameter, nearly twice as heavy as that ordinarily used for fueling at sea. The first fueling was done in a gale of wind, and it was a novel undertaking for all concerned. Yet it was successfully accomplished; the second time fueling was done, it was easier; and without further noteworthy incident, the detachment arrived at bases 17 and 18 in the evening of June 29. The *Benmore*, having finished her mine planting off the north of Ireland under the direction of the British Admiralty, joined the others at base 18 on June 2, thus making the squadron of mine planters complete.

CHAPTER XIV.—COMMANDER MINE FORCE—APPOINTMENT; ARRIVAL IN EUROPE; PREPARATIONS FOR COMMENCEMENT OF MINE LAYING.

As preparations progressed it became apparent that our mining operations were developing into one of the major war activities of the United States Navy, and it was desirable that it should be commanded by an officer of appropriate flag rank. Accordingly Rear Admiral Joseph Strauss was appointed commander mine force, United States Atlantic Fleet, relieving Captain R. R. Belknap, the middle of February, 1918.

This appointment was particularly suited to the capabilities of Rear Admiral Strauss, who had spent a large part of his service in the development and design of ordnance, and had preceded Rear Admiral Ralph Earle as the chief of that bureau. The mine-laying program now in hand called for a vast expenditure of money for the production of mines which, as a type, were unknown and untested. Minor tests had, of course, been made of the constituent parts and were individually gratifying; but in any complex mechanism such as a mine, a torpedo, or a gun mount, an actual test of the completed unit under service conditions is the only true proof of its efficiency. At the outset it would seem that a mine should be extremely simple to design and construct. Such is far from the case. Prior to the development of this mine the United States Navy had never produced a really satisfactory mine. The demand for immediate antisubmarine measures was so urgent in order to prevent the loss of merchant ships from reducing the available tonnage below that required to successfully prosecute the war that, tried or untried, it was necessary to begin at once, on a large scale, the manufacture of this new American mine.

After receiving his appointment as commander mine force, Rear Admiral Strauss spent several weeks in Washington on temporary duty in the Office of Naval Operations, familiarizing himself with all information bearing on the operation and with the prep-

arrangements then in hand, also reviewing the status of the work being done by the Bureau of Ordnance in connection with the production of the mines. Several days were spent in inspecting the new mine layers being fitted out at New York and Boston. Then arrangements were made to proceed to Great Britain to complete the preparations necessary to enable mine laying to begin immediately upon the arrival of the squadron.

After reviewing the correspondence in Washington relative to the nature of the proposed mine barrage as then agreed upon, which, in addition to leaving Pentlands Firth open, left a clear passage nearly 10 miles wide between the Orkney Islands and the western end of the barrage, besides some 110 miles which were deep mines only, Admiral Strauss wrote to the Chief of Naval Operations on March 7:

"In considering the scheme to which the mine force's efforts are to be devoted I desire to invite attention to the following necessary conditions to insure success:

"First, every outlet to the broad sea must be closed by mine barriers. This includes the outlets to the Atlantic provided for in the proximate plans, as well as those to the Mediterranean through the Dardanelles and the Adriatic. There must be no leaks anywhere. While it would afford a serious check to submarine attack were our enemies' submarine bases confined to the Mediterranean, nevertheless an enemy so enterprising must not be given even so restricted an opportunity.

"As to the means for accomplishing the end sought, (the Mark VI mine), I think it too soon to predict success for this factor of the problem. I believe that the Bureau of Ordnance has done its work carefully and with the greatest intelligence, and we can only hope for the best results. I am prevented from a feeling of assurance, however, by the fact that actual experience with the mine is very limited. Unfortunately faults develop in every new mechanism no matter how much skill and precision has been employed to close every avenue of failure. It would be too much to hope for the complete success of the new mine, and we must be prepared to make alterations in the mines at the operating bases, where the first reports of extensive tests will be received. At this date, as nearly as I can learn, no complete mines have yet been delivered for shipment, but parts have been delivered and complete mines are expected shortly."

On March 12, 1918, Rear Admiral Strauss accompanied by Lieut. Noel Davis, United States Navy, who had reported the previous day for duty as Aide, sailed from New York City on the Steamship New York. Arriving in Liverpool, England, March 23, he proceeded at once to London and reported that afternoon to Vice Admiral Wm. S. Sims, Commander, United States Naval forces, European waters.

The following five days were spent at London headquarters going over the recent developments in the status of the barrage and in calling on the various officials at the British Admiralty interested in the enterprise.

On March 28 Admiral Strauss with Lieut. Davis left London arriving at Grangemouth, Scotland, the same day to call on rear Admiral Clinton-Baker, R. N., who commanded the British Mine-laying Squadron which had been allotted to cooperate with us in the North Sea Barrage. Grangemouth, which is situated on the Firth of Forth about 18 miles west of Edinburgh, was the British Mining Depot from which their First Mine-laying Squadron operated. The afternoon was spent discussing the plans for mine laying and in inspecting the assembly plant.

The following morning, March 29, 1918, Admiral Strauss arrived at Inverness, where he was met by Capt. O. G. Murfin, United States Navy, commanding officer of United States naval bases 17 and 18. The day was spent inspecting base 18 and establishing the headquarters of the commander mine force in the office building at that base.

The following week was occupied by inspection of the various stations under the jurisdiction of the commander, mine force—base 17, Kyle of Lochalsh and Corpach—and this time the work of construction at the bases had progressed to such a point that it would have been possible to begin the assembly of mines had the necessary mines and mine layers been ready.

On April 10 Admiral Strauss visited the Grand Fleet at Scapa Flow and called upon Admiral Beatty, commander in chief, to discuss the contemplated mine barrier. It was apparent that the commander in chief was anything but enthusiastic about a mine barrier across the North Sea. British mine laying had begun in area B and skimming sweeps had showed that some of the mines had not taken the designed depth and would have been dangerous to surface vessels crossing the field. This undoubtedly alarmed the commander in chief, and, together with the restrictions on the freedom of movement of the fleet imposed by such a barrage, it is only natural that he was not enthusiastic. The main result of the visit, however, was to make definite arrangements for the escort of our mine layers while out at sea. No American destroyers were obtainable and the mine squadron was thus totally dependent on the Grand fleet for escort and could not leave the bases until such escort was provided. The number and type of escorting vessels was to depend upon the disposition of the German fleet at

the time of the mining operations. If the enemy fleet was at sea, it would necessitate sending out a portion or possibly all of the Grand Fleet. The commander in chief, requested Admiral Strauss to telegraph him 48 hours before the squadron was ready to go out and escort would be arranged.

Capt. H. E. Mulleneux, R. N., was ordered to Inverness as liaison officer between the two services and as the representative of Rear Admiral Clinton-Baker at Grange-mouth. Capt. R. E. Chilcott, R. N., was ordered to Invergordon in a similar capacity. While the bases were under construction (which was largely controlled by Admiral Clinton-Baker) these officers were of much assistance. However, as the construction drew to an end and the work of organization and administration became the predominant factors the usefulness of liaison officers was very much lessened. One of the fundamental stipulations in the agreements for the execution of the barrage was that we should have entire freedom as to the manner in which our mines were to be laid.

In our operations we were associated principally with the following British officials: Commander in chief, Grand Fleet; Rear Admiral, Invergordon, and the senior naval officer, Inverness. As we were supplied with all the various British secret and confidential publications, the question of communications, etc., became in a few weeks, equally as simple as our own, and to transmit all requests, communications, etc., via the liaison officer simply complicated matters and added an additional link to the chain. The result was, obviously, that there gradually became so little for them to do that they were finally ordered to more important duty. Just prior to the arrival of the minelayers the Admiralty, at the suggestion of the commander in chief, Grand Fleet, kindly offered to send one or two experienced officers to be attached to the staff of Admiral Strauss to assist with the administrative and communication work. Up to this time no difficulties of any kind had been encountered and their services were accordingly declined.

Much concern was caused when the U. S. S. *Lake Moor*, the fifth mine carrier dispatched to the bases was torpedoed and sunk in the North Channel to the Irish Sea on April 11, 1918. The vessel was attacked about 11 p. m. and sank very shortly after being struck. The night was dark and rescue work was difficult. Fifteen survivors were picked up. The cause of alarm, however, was from a totally unexpected source. When the torpedo exploded it opened up the hold in which the firing devices for the mines had been stowed. The success of the North Sea barrage depended in a large measure in maintaining the secrecy of this device and the most stringent measures had been followed from the place of their manufacture until the mines had actually been planted.

Each device was packed in a separate wooden box near the top of which hand-holes had been provided to facilitate handling. The top end of the firing device was heavier than the bottom and as soon as it fell into the water it toppled over with the heavy end down and the air trapped in the bottom of the case kept it afloat.

Four of these cases were picked up by a patrol vessel. As soon as this information was received arrangements were made to have the coasts in the vicinity searched and all cases found shipped to Base 18. Besides the possibility of an enemy submarine picking up some of these floating boxes, the accident occurred close to the Irish coast and just at a time when the Irish situation was most critical. Fortunately, however, it appears that none of these devices fell into improper hands. The Germans, at any rate, did not learn the secret of the American mines until possibly months later when it might have been obtained from mines washed ashore in Norway.

In response to a cabled request, Lieut. W. K. Harrill, United States Navy, reported at Inverness on May 8 for duty on the staff of Admiral Strauss as force radio officer. During the war the Grand Fleet had greatly developed radio telegraphy and established special rules for transmitting messages so as to prevent enemy stations from ascertaining by radio compasses the whereabouts of allied men of war. Lieut. Harrill was immediately sent to the Grand Fleet to familiarize himself with the current practice and the equipment which would be required for our vessels in order that they might be brought up to the necessary standards as soon as possible after their arrival. Special arrangements were made for immediately supplying them with radio buzzer sets and rejector circuits, etc. As soon as possible after the ships arrived each radio force including the communication officer was given one to two days thorough instruction by the force radio officer, assisted by Lieut. Grant, United States Navy, radio officer from the U. S. S. *Delaware*, with special attention to the numerous confidential publications and also the salient points in British radio procedure. This was supplemented by a school established at Base 18 for ships in the harbor. When the squadron sailed on its first excursion, June 7, all ships were equipped with the special apparatus, and on the next excursion the mine force conducted all radio communication in accordance with British procedure.

The work of establishing a suitable organization to coordinate the bases with the vessels and the preparation of instructions for the force was the most important task of the commander mine force during the months of April and May. Mine parts were beginning to arrive and it then appeared that sufficient would be on hand by the time the squadron arrived to enable an excursion to go out immediately. It was mandatory therefore, that no administrative oversight, such as insufficiency of provisions, supplies, current recognition apparatus, etc., should cause a delay in the operations.

The mine force instructions were drawn up to include not only the necessary instructions with regard to liberty, leave, patrols, repairs, routine reports, etc., which commonly comprise such a publication, but also specific instructions for passing the harbor defenses at Inverness and Invergordon, obtaining water, coal, and provisions, the proper means of obtaining miscellaneous supplies from Admiralty stores; special instructions for handling the various classes of mails; censorship regulations; train schedules; arrangements for handling liberty parties by British drifters allotted for this purpose; the various recreation facilities on shore for officers and men—in fact, effort was made to include in the one set of instructions all possible information which were prepared in loose-leaf form, so that when it became necessary to make changes or additions it might readily be accomplished to maintain in one volume practically everything necessary for the operations of the force and to eliminate the necessity of hundreds of miscellaneous letters on equally as many subjects, which are always most confusing because they are so difficult to keep in touch with.

Special contracts were arranged by the force supply officer with local dealers for the supply of meats, vegetables, and other fresh provisions at fixed prices. A channel was dredged in Inverness Firth to permit mine layers to go farther up the firth to Beaully Basin which is adjacent to base 18. The Firth, which is shallow, was surveyed and a new chart published. Moorings were laid to accommodate the mine layers in the more restricted anchorages.

Taut wire measuring gear was obtained for each vessel and held in readiness for installation on their arrival. This gear proved most valuable for navigational purposes. It consists essentially of a drum carrying 140 miles of fine piano wire. A suitable weight is secured to the end of the wire and dropped overboard. The wire as it is paid out is measured by a recorder which shows with a remarkable accuracy the actual distance traveled over the ground.

Arrangements were made for the commander mine force to act as the distributing authority for all United States and allied secret and confidential publications. British chart portfolios were obtained for each ship. Special apparatus required for making recognition signals was also procured and held ready for the ships.

By the time that the squadron was due to arrive all preliminary work had been completed. The mine-force instructions and necessary harbor charts were taken on board by the pilots sent out to meet the ships and bring them into Invergordon and Inverness upon their arrival.

CHAPTER XV.—CHANGES IN BARRAGE PLAN.

In view of the formal approval by the Navy Department and the British Admiralty of the northern barrage plan as it existed on November 1, 1917, the department, and more particularly the mine section of the Bureau of Ordnance, naturally assumed that such changes as might become necessary during the operation would be only of a minor character and that the major features, notably the location of the barrage on the Aberdeen-Ekersund line, could be regarded as definitely fixed, and on this assumption the manufacture of the immense quantity of material required was taken in hand and pushed to the utmost. This assumption soon proved, however, to be without foundation, and from December until the cessation of hostilities there were so many changes in plan and so much resultant confusion in the manufacturing and shipping projects that the whole operation was seriously delayed, its success gravely hazarded, and its effect undoubtedly much reduced below what was to have been expected from the execution of the original proposition.

A communication of December 6 from the Admiralty to Admiral Sims, written after the subject of the laying and patrol of the barrage had been discussed in consultation with the commander in chief, grand fleet, stated that: "It has become clear that there will be considerable difficulty in patrolling the eastern portion of the barrage as at present proposed, and in affording support by light cruisers, etc., if no Norwegian port is available as a base * * *. An alternative position for the barrage has accordingly been worked out on the line Orkney-Bergen in place of Aberdeen-Ekersund." The various advantages and disadvantages of this change were outlined and the suggested change submitted to the United States for approval. The question was referred by Admiral Sims to the Navy Department for decision as soon as the proposal

of change was received (Dec. 7), which replied that: "Unless reasons for change are fundamental, advantage of new location would not offset loss and delay by derangement of plan for mine material."

In this connection the British "History of northern barrage" states that the Admiralty in its communications to the commander in chief, grand fleet, and to Admiral Sims, made the following points among other relative to the proposed change:

"The mine barrage is of no value unless the deep portions are patrolled, and the patrols must be adequately supported to be effective * * *."

The provision of the 42 destroyers for the patrol of the eastern area would also prove extremely difficult without assistance from the grand fleet.

The material will be equally suitable for the new line.

"The proposed alteration should not delay completion."

The last two points quoted were entirely in error so far as American mine material was concerned, since the proposed new location of the barrage in deeper water would necessitate increased lengths of mooring ropes and, as to manufacture of material was well along, delay was inevitable.

The proposed change was based on the broad strategical and tactical grounds, and the Navy Department was forced by circumstances to agree to it, though most reluctantly.

In reply to the Admiralty communication of December 6, a memorandum was prepared by the planning section of Admiral Sims' staff and issued January 1, 1918, which reviewed the entire situation and set forth the views of the United States in part as follows:

"The second position considered in this memorandum is the one now proposed by the British Admiralty and accepted in principle by the Navy Department. There are many factors pro and con that entered into a choice as between the two positions, but of these a single factor controlled, viz—that the new position is deemed best by the Grand Fleet upon which will rest the responsibility for the support and patrol of the barrage. The new position gives greater freedom of movement and greater ease of support to surface vessels, while it imposes corresponding difficulties upon the operations of enemy surprise vessels. The change in position accepts the handicap of an average increase in depth of water about 15 fathoms. This handicap might be considered serious were it not for the fact that the whole barrage is based on the assumption that an effective mine field can be laid in 1,000 feet of water. If this assumption be true, then whether a portion of the mine field be laid in 40 or in 60 fathoms of water is not material, except as the changes in plan introduce delay.

"It will be noted that the original line extended from mainland to mainland, while the new line extends from island to island, and has in it passages completely navigable to submarines. This condition is, in our opinion, undesirable:

"The proposed character of the barrage does not provide for the full accomplishment of the mission. The proposed barrage will not close the northern exit from the North Sea because—

- a) The barrage is not complete in a vertical plane in areas B and C.
- b) The barrage is not deep enough.
- c) The Pentland Firth is open.
- d) The waters of the Orkney Islands, for a distance of miles, are open.
- e) Patrol vessels on the surface are not sufficiently effective in barring passages to submarines, as witness the Straits of Dover.

The barrage is to be a great effort. It is our opinion that nothing short of a sound design will justify the effort.

"The requirements of a sound design are, the extension of the barrage complete in the vertical plane from coast to coast.

"The necessity for an opening in the surface barrage is recognized, but it is held that this opening should be in the surface barrage only, and that the deep barrage should be widened so that the difficulties of navigating the opening submerged may be practically prohibitive."

In conclusion it was tentatively decided (by United States planning section):

1. To accept the new position in barrage as outlined by the British Admiralty.
2. To urge that the barrage be completed in the vertical plane from coast to coast, except an opening in the surface barrage at the eastern end and in Norwegian territorial waters.

3. To carry the barrage to 295 feet (British plans 200 feet).

4. To have surface mines fitted with 70-foot and other mines with 100-foot antennæ.

As then proposed, the barrage was divided into three areas designated and located as follows:

Area B. A 20-mile wide section extending 50 miles to the eastward of the Orkney islands.

Area A. A section 50 miles wide extending 134 miles to the east-north-east end from the eastern end of area B.

Area C. A 50-mile wide section extending from the east end of A 60 miles east-south-east to Norwegian territorial waters.

The United States was to furnish the mines and material for and lay both deep and surface fields in area A. Great Britain was to provide and lay deep mine fields in areas B and C and furnish trawlers and fast vessels to patrol these two areas.

The British Admiralty Plans Division answered the above memorandum with the opinion that:

"The stopping power of the mine barrage should not be over rated. It is the patrol craft armed with various antisubmarine devices on which we must rely to kill the submarines. It is on the mine fields that we rely to give us intensity of patrol. Until we have proved the efficacy of the American mine field, we must look on it as a bluff. We must not attempt to put the bluff too high by notifying an area up to the 3-mile limit of Norway. The navigation of Pentland Firth by submerged submarines is considered impracticable. As it is the patrol craft we rely on to destroy the submarine it is not considered that leaving the approach to Pentland Firth uncovered is of vital importance."

It was further stated that it was not considered necessary to carry the barrage to a vertical depth of 300 feet, that there was no reason why the American portion should not be laid in accordance with the United States views but that the Admiralty would be prepared to extend their barrage to a greater depth, if found necessary, and to mine the surface if that should become desirable.

In view of these differences of opinion the United States planning section prepared a memorandum of January 12, containing its understanding of the status of the mine barrage and submitted it to the British planning section for confirmation in order to reconcile the various points and further unify the effort, by reducing to writing a concrete plan which would be acceptable to both navies. Further than the agreement regarding the supply of all mine-laying operations and the assignments of provision and laying of mines in the areas as previously noted, these efforts met with failure in so far as formal agreement on a written plan was concerned, the British apparently desiring to reserve the privilege of altering the plans when expediency so dictated while considerable skepticism existed as to the ability of the Americans to execute satisfactorily their part of the project. The above-mentioned characterization of the American mine field as a mere "bluff" was more or less indicative of the British attitude.

The Admiralty did, however, accept the principle of surface mining in areas "B" and "C" should experience indicate that the surface barrage be more effective in preventing the passage of submarine than the surface patrol.

After this discussion the planning section of the Admiralty not being in a position to enter into any definite signed agreement, nor to definitely recommend it to the Admiralty, Admiral Sims requested the status of the plans in so far as the Admiralty's agreement with them was concerned. This resulted in a statement of January 13 which included:

"United States to be responsible for provision of mines and mine layers for area A. Great Britain for areas B and C. Area A to be mined from 10 feet below surface to as near 300 feet as the American mines will permit.

"Areas B and C to be mined for 65 feet below the surface to 200 feet.

"When this belt is effectively mined the question of extending the mine fields to a greater depth will be considered.

"The desirability of extending the deep mine fields to the surface of areas B and C will be considered when the situation has developed further * * *."

Thus early in January the character of the proposed barrage became so modified as to bear little resemblance to the original plan and the original faith of its proponents in its effectiveness was no longer felt to be justified. It was felt in America, in view of the attitude of the Admiralty and the commander in chief of the Grand Fleet, that the British had no real faith in the American mine and were not whole-heartedly supporting the project. In particular, the allocation of both ends of the barrage to the British to be mined with an inferior mine in an incomplete manner, and the further decision that the American part of the barrage was not to be patrolled were most discouraging.

Not the least discouraging feature of the situation, to the Bureau of Ordnance, was the state of flux of the barrage plan and the obvious reluctance of the Admiralty to commit itself to definite plans. The British authorities had the appearance of not daring to give up the whole operation for fear of possible later criticism and at the same time of not being willing to cooperate to make it successful.

In Admiral Sims's review of the activities of his command it is stated, in effect, that throughout the discussion of the barrage project it became apparent that the Admiralty was influenced by two considerations which may not clearly appear in the correspondence and records but which should not be underestimated in considering the mine field historically.

First, the proposed effort on the part of the United States Navy Department was such a handsome offer from an ally that, even if there were doubts of its success, it would be poor policy to put only discouragement in the way of those who were willing and anxious to go ahead with the project. The Admiralty naturally wanted to avoid any possibility of not having tried the mine barrage, and subjecting themselves to possible later criticism on the score that it was necessary and would have worked had it been tried. In other words, the Admiralty at first was very dubious of the success of the field but considered the proposals for the above reasons more favorably than they otherwise would have. As the details of the plans developed and the reports of Mark VI mines were received, there was very notable increase in the enthusiasm for the project. At the start there was no enthusiasm at all. Later there was to be considerable.

The second consideration which should be mentioned in explaining the Admiralty's policy toward the project was its effect on possible fleet actions. The Navy Department considered it almost entirely in the light of an antisubmarine measure. It was apparent that although nominally under the Admiralty in London, the planning for the Admiralty in such matters as would in our organization be dealt with by the Chief of Naval Operations rested almost exclusively with the officers of the Grand Fleet, in spite of the existence of a plans division in the Admiralty. Naturally, they considered it largely from their own viewpoint, and in studying possibilities of the barrage they were influenced by the fact that even if it did not work it might be something which would force a general fleet action. If there were a serious attempt made by the Germans on the mine barrage itself, or raids on the vessels engaged in working on it, cruiser actions at least would be probable, and with the arrival of supporting units it was quite possible that the two fleets might meet. They thought that even if it did not work as a mine barrage it might be a bait for a fleet action. It would make it harder for raiders to get out. So long as the Grand Fleet did not have its freedom of movement restricted (and the fleet was by no means so thoroughly convinced of the safety of the British mines in the deep mine fields as the Admiralty was), they had no objection to it and were rather inclined to favor it for the reason that it might help them meet the German High Seas Fleet. These reasons were at times mentioned and were very apparent in discussions, but are hardly evident in the records and were certainly not emphasized by the Admiralty in the correspondence. It appears very essential, however, to a good historical understanding of the northern barrage that they should not be overlooked, but should be most particularly mentioned.

Another thing which might be mentioned in this connection is that later in the discussion when the policy of the extension of surface mines into the end areas was considered, this project was proposed and pushed by the United States planning section and was always fairly well considered by the planning section in the Admiralty, but an extremely large percentage of what opposition there was to it came from the Grand Fleet, and it was only very grudgingly that the Admiralty, considering the views not only of its own planning section, but also the recommendations from the fleet, consented to the modification of the mine barrage which later resulted in putting surface mines in areas which were at first intended to have deep mines only, although the United States had argued for surface mines as well in these areas.

The fundamental idea on which the mine section of the Bureau of Ordnance designed the new mine and proposed the northern barrage was that the barrage would be complete from coast to coast and that it would be patrolled so that enemy submarines could be forced by the presence of patrols either to turn back or to risk almost certain destruction by trying to pass the barrage submerged. Any departure from this principle meant ineffectiveness.

The following remarks quoted from a memorandum prepared by an officer of Admiral Sims's staff, at the time the change in plan was under discussion, are interesting:

Position.—The more northern position accepts disadvantages as regards depth of water in order to obtain certain strategical advantages. This statement, however, is no more true now than it was when the southern line was previously decided upon by all concerned. If we are disinclined to admit that a mistake was made in the original instance by choosing the southern line, we must now show that the reasons for the shift to the northern position are new reasons or things which did not hold true at the time of the other conference. The only new conditions mentioned are that

whereas previously it had been hoped to obtain a Norwegian base one is now not considered possible. The other reason is the increased activity of enemy surface craft. Taking the first of these reasons, I am inclined to suspect that there is not much to it. I think that a Norwegian base now is just as easily possible as one was previously. I base this on a recent conversation with Col. Breckinridge, Naval Attaché in the Scandinavian countries and who had just been in Norway. There is probably no useful point, however, to trying to get behind this reason if the admiralty really sees fit to advance it. The second reason of the increased activity of enemy surface craft looks like an excellent one after the losses of the two Norwegian convoys recently. Steps have been taken to improve the Norwegian intelligence service as to information about the enemy craft coming out of Shaagerak but this will probably be offset by the increased incentive for the Germans to send our mines.

"In looking over all the papers I can not help but believe that in the early conferences the fleet was not so very thoroughly represented, and there were people from the mining division who explained that sending the fleet over a deep British mine field was nothing to hesitate about. The fleet was in Rosyth, south of the present barrage, and was generally expected to stay there. Now with the fleet back in Scotland I believe that they are beginning to assert their views to a greater extent and at least a large part of their insistence to move the southern end north to the Orkney arises from their disinclination to navigate over British deep mine fields. This is not a reason which there is much point in emphasizing from the admiralty's standpoint so it was really not presented but the argument was made along other lines. Even as a matter of being perfectly frank with us I do not think that it matters so very much whether the real reasons for the change in the position of the barrage are those which they mention or others, equally good ones, which they hesitate to talk about. In my part, I believe that the fact that Admiral Beatty, who is going to support this mine field, says that it must go in the northern position finished the whole discussion and is something that we need not go behind.

"*Character of barrage.*—I believe that the width of the C area along the Norwegian coast is much too great. Leaving it this wide seems to have been based upon the idea

"(a) It is not good policy to unnecessarily crowd the Norwegian coast with a notified area if it can be avoided.

"(b) They have an idea of wanting to do the whole project on a fifty-fifty basis and the deep mine fields of this width are symmetrically arranged. This is no reason at all.

"I can not help but doubt when I compare the width of this area with the Straits of Dover and consider all conditions existing in that locality, that the deep mine field particularly on the Norwegian coast, will not be efficient and it will have to be largely modified by strengthening with surface mines. I have met officers in the Admiralty who privately expressed the same opinion and stated that in the end they would be proved correct by the addition of surface mines in area C.

"*Length of antenna.*—Seventy feet for the top mines and 100 feet for the other row. This is based on the hope that at greater depths 100 feet may be effective and that at any rate it will probably drive the boat to the surface, in which case the 70-foot antenna of the top row of mines, which should be nearest to the edges of the field, should get the boat and destroy it. Seventy feet all around would be better, perhaps, but submarines can now go so deep that it becomes a necessity to try to stretch out the barrage vertically, even at the expense of some other small advantages.

"*Character of mine fields on the Norwegian coast.*—The whole mine barrage scheme is more or less of a tentative nature, because it is so big an undertaking that it can not in all ways be perfectly designed to meet every conceivable counter measure. Also it would be uneconomical and inefficient to try to plan it with any such final ideas in mind. The final appearance of the barrage before the end of the war is something which one would have to be extremely rash to care to prophesy. There are a few things which our personal opinion leads us to believe will be the most urgent modifications and the ones which we will see first. In my case, I look to see the Norwegian end of this field protected on the south by perhaps one system of antenna mines before any great time has elapsed and the notified area appropriately extended. This will relieve patrol craft in the C area of part of their difficulty.

"The question of who takes the C area has not yet been decided. We have gone ahead and made mines with long lengths of specially small diameter mooring line which will do in this place. I foresee that we will eventually have to do something with mines of this nature and think it would be a very good thing to make a careful analysis of conditions in area C, even although it is not our own area, with the idea of seeing whether later on we may be able to use these mines additionally. Mines intended for deep water like these can be laid in shallow water, but mines with short lengths of wire (and the diameter of the wire is different) can not be used in deep

Can we not compromise in our present disagreement as to who takes the Norwegian area by finding both kinds of mines are needed and helping to do that, too? In area B the necessity is by no means so great. The fleet does not want any surface mines to obstruct its passage, but after finding patrolling rather difficult it may look favorable upon a project of extending the surface mine area. The water is not deep in this place. We will need no surface mines here until after area C is taken care of. It is not safe to look beyond that point * * *."

In order to focus attention upon the various points still unsettled there was then prepared by Admiral Sims a paper dated February 19, setting forth the different items in parallel columns and this was submitted to the Admiralty. This was answered on February 26, but as stated in a letter from Admiral Sims to the Office of Operations on March 2, "It appears that although a number of the points have been cleared up * * * there still remains a decided difference of opinion in regard to certain important points."

It is believed that the Admiralty's disinclination to extend Mark VI mines to the end areas until their efficiency has been demonstrated in area A is not based on sound reasoning, for with the efficiency of the mine in area A or in any other area the success of the barrage stands or falls * * *. If the more efficient mining of these end areas is delayed, until the inefficiency of patrols in these areas is demonstrated, it is believed that much valuable time will be lost in a case where time is a vital element."

Anticipating the necessity for this end area surface mining Admiral Sims, on April 1, applied to the Navy Department requesting preparation of mines for area C. Meanwhile deep mining had been commenced by the British in area B, but, owing to unexpected difficulties with the British mines themselves, the operations were suspended before one complete line had been run.

The commander in chief of the Grand Fleet was much disturbed by these unsatisfactory results and the Admiralty felt that they could not continue laying the barrage in area B until the faults had been discovered and removed.

Shortly after this in a letter of April 18, 1918, to the Office of Operations Admiral Sims stated:

"Owing to the apparent uncertainty in the Admiralty as to the further execution of the plans of the northern barrage, I caused the matter to be brought up at the staff meeting this morning, at which I proposed the following: We lay two single lines of surface mines over the southern portion of area C; British to lay one system of deep mines over the northern portion of area C; area B to be deep mined as already planned, except that the mines are to be carried close up to the coast (islands) without leaving the 7-mile channel now shown on the chart."

The proposal, in so far as it applied to area C only, was accepted by the Admiralty formally on April 20.

Thus it will be seen that the original contention of the United States authorities in regard to the need of a complete barrage, including surface mining in the end areas was not allowed to rest upon the proof of ineffectiveness of surface patrols, for this particular barrage, but the inefficiency of such patrols, as amply demonstrated in previous mining efforts was at last permitted by the Admiralty to outweigh their desire for wide passages for the Grand Fleet.

But this was still only a partial conversion to the idea, for area B still remained in question. Here all mining was stopped. The failure of the British deep mines was responsible for this, and although the necessity was still acknowledged, as noted in the Admiralty's letter of May 10 to Admiral Sims, it was said:

"The deep mine-field in area B can have no effect in restricting the areas through which the submarines can pass and should not therefore be considered an essential part of the scheme."

Although a verbal agreement was made that as soon as the defects of the deep mines could be remedied the laying of area B would proceed, the safety of ships passing over the field could never be guaranteed and in the memorandum of the deputy chief of naval staff (Admiralty) received by Admiral Sims on July 25, the conclusions were that either area B was to be swept and left clear or that it should be completed with deep and shallow mines. Also that if the latter were done "the channel between the western extremity of area B and the coast line would be so narrow that it would not be available for general purposes."

The width of this channel according to a report of the technical committee (Admiralty) "will be eventually decided with the commander in chief, Grand Fleet, but in view of experience at Dover and difficulty of antisubmarine patrolling without mines, it should not be unduly wide."

To further the desire to actually complete the barrage the Bureau of Ordnance was asked on July 31 to prepare American mines for area B. Then as a result of a

considerable irregularity in the bottom and much variation from the survey soundings which were used for setting the fixed moorings. This was particularly true in the northeastern part of the field.

Prior to the discontinuation of the planting operations by the *Baltimore*, it appeared as though it would be impossible for her to complete this mine field in time for the mine squadron for the first operation in the North Sea barrage. Accordingly the Navy Department was requested to send either one or two of the new mine layers which were most nearly completed to assist her in order that all vessels might be available as soon as operations could begin in the North Sea.

In response to this request the *Roanoke* sailed from the United States on May 25. Before her arrival, however, the *Baltimore's* operations in the North Channel had been discontinued. The *Roanoke* remained several days at Lamlash, then sailed to base 17, where she arrived a week ahead of the other mine layers.

The *Baltimore* remained on the West Coast for several weeks in order to perform experiments for the British in connection with mine laying and mine sweeping. She then proceeded to base 18, where she arrived on June 2, 1918.

In the meantime preparations for the commencement of mine laying had been completed. Early Sunday morning, May 26, 1918, the *San Francisco*, flagship of the mine squadron 1, accompanied by the *Canonicus*, *Canandaigua*, *Housatonic*, *Quinnebaug*, arrived at bases 17 and 18. The squadron commander reported that the vessels would be ready to commence mine laying as soon as they had been water-bored and refueled. The delivery of mine parts, however, had not come up to expectations and prevented the beginning of operations at once. All of the necessary mine parts were on hand except the antenna floats for mines planted at the lower levels, and it was necessary to wait until a mine carrier had arrived before sufficient of these floats were on hand to enable the necessary numbers of mines to be assembled for the first excursion.

The first excursion was to be a joint operation between the British mine laying squadron, which had been designated by the Admiralty as the first mine-laying squadron, and our vessels which they had named the second mine-laying squadron. We reported that our squadron would be ready to go out on June 6, but it was necessary to wait one day while the British completed the assembly of their mines. The United States squadron left the bases, rendezvoused outside Cromarty Firth with the British destroyers sent to escort them, then proceeded via the swept channels and across the North Sea until Udshire Light was sighted on the coast of Norway. This was used as the point of departure, being the nearest point of land to the position at which the mine laying was to commence.

No difficulties were encountered by any of the vessels with their mining installations or the lack of experience of their crews. The mines were laid with accuracy and precision and the ships, in spite of the various types which constituted the squadron, maneuvered well together.

When the mine field was first proposed it was intended to plant the mines at intervals of 150 feet, but tests conducted by the *San Francisco* while in the United States showed this distance to be impractical on account of the damage done to adjacent mines when one mine exploded. As a result of these experiments it was finally decided that 250 feet was the minimum distance at which mines could safely be planted, and this spacing was used on the first excursion.

Shortly after mine laying had commenced mines began to explode prematurely. This continued as long as the squadron was in touch with the mine field, but the frequency of the explosions decreased rapidly after the laying was completed. By counting the explosions it was estimated that between 3 and 4 per cent of the 3,385 mines laid had blown up. Some of these explosions took place almost immediately after the mines went overboard, severely shaking the vessels from which they were laid. Others did not explode until days after they had been in the water. These explosions, which occurred after each excursion, presented the most baffling problem which the mine force was called upon to solve. Although a loss of 4 per cent of the mines did not seriously reduce the efficiency of the barrage as a whole, such a condition, was, nevertheless, undesirable, and every effort was immediately applied to ascertain the cause.

There appeared to be some doubt as to whether the spherical cylindrical buoys, which were dropped upon completion of the mine laying to mark the end of the field so that the next excursion could commence as close as possible without danger, would survive the weather until the ships again went out. The commander in chief, Grand Fleet, was therefore asked to send two sloops or trawlers to stand by these buoys and assist the squadron in finding them when taking their departure on the following operation. These vessels while performing this duty were able to supply much valuable information to the commander, mine force, as most of them were fitted with listen-

devices, which enabled them to hear and record the explosions occurring between successive operations. From 1 to 11 explosions were noted daily for seven days. At that time practically all explosions had ceased. This seemed to indicate that gas leakage was probably causing these later mines to fire.

Of the 12 marker buoys which were dropped at the end of the field only 3 broke apart during the following three weeks. Their endurance was sufficient for the purpose intended, and the commander in chief was informed on July 27 that vessels would no longer be required to keep watch on the buoys.

The British mine-laying squadron proceeded separately to area C, where their mines were laid on the same date that ours were put down.

As a result of the joint studies of the American and British planning sections, a somewhat radical but beneficial change in the nature of the field in area A was adopted early after the commencement of active mine laying.

As originally agreed upon the American mine field in this area was to consist of three systems, each system comprising one line of mines at 80 feet, one at 160 feet, and one at 240 feet. This arrangement gave an equal density of mines from the surface to the bottom of the barrage. Since, however, there was to be no patrol in area A, submarines attempting to cross the field would undoubtedly do so on the surface, where the damage in case of striking a mine would be the least. Also, submarines being pursued by slow vessels would prefer to proceed on the surface where their chances of escape were best.

Accordingly it was decided that the third system, instead of consisting of one row of mines at each of the three depths, should consist of three rows of surface mines, i. e., 80-foot submergence.

Immediately following this alteration it was decided to double the number of rows of mines in area A. The original plan had called for mines to be laid 150 feet apart, but due to the damage caused by the explosions of neighboring mines and the possibility of countermining, this distance had been gradually increased until it had become 300 feet, just twice the original figure. It was therefore necessary to double the number of systems to give the field the same approximate effectiveness as originally planned.

After the above two changes the barrage in area A was to consist of 10 rows of mines at 80-foot submergence, 4 rows of mines at 160-foot submergence, and 4 rows of mines at 240-foot submergence. As the mooring ropes for the mine anchors were cut in different lengths to correspond with the three depths at which mines were laid, the above change necessitated supplying a great many more anchors for 80-foot mines and fewer for the deeper levels. Fortunately the Bureau of Ordnance was able to meet the new demands without causing delay in the operations.

Shortly after mine laying had begun in area C the Norwegian Government issued a decree to the effect that belligerent submarines equipped for use in warfare must not leave or stay in Norwegian territorial waters except by reason of stress of weather to save life. Breach of this prohibition would expose them to armed attack without warning. Norway also reduced the limits of her territorial waters from 4 to 3 miles, since the former figure was not recognized by the principal belligerent nations. This decree, rigidly enforced, would have had the same result as if British and American mines had been laid right up to the Norwegian coast instead of stopping at their territorial waters, but there was good reason to believe that the decree was not enforced against German submarines.

After the completion of the first excursion further mine laying by the United States mine force was temporarily prevented by the nonreceipt of mining material. The first excursion had used up all but three of the antenna floats for the lower level mines. Tests were conducted in Loch Ness to ascertain whether the antenna floats designed for the upper level mines would withstand the deeper immersion.

There were plenty of these floats on hand, and they could have been used and been available. They would not, however, hold up when submerged to the necessary depth. The only other possible alternative for continuing mine laying was to lay the two lines of surface mines in area C, which we had recently agreed to do, but here again we were delayed. Although it was expected that the British would agree to laying surface mines in this area and the mines had actually been ordered several weeks before the concession had been obtained, there had not been sufficient time for these special anchors to reach the mine bases.

In the meantime the British mine-laying squadron had completed its second and third operations on June 18 and June 30.

The necessary number of anchors for laying two rows of mines in area C finally arrived, and four of the mine layers got underway June 30, laying their cargoes of mines on the following day.

Again approximately 4 per cent of the mines exploded prematurely.

After the first excursion the probable causes which were thought might be responsible for the premature explosions were gone into and at the same time it was believed that they were largely caused by inaccuracies in assembly and testing, due to the inexperience of the personnel at the bases. The problem was not, however, allowed to rest on this conclusion. Tests were undertaken in Loch Ness and Loch Lomond to determine the accuracy of the depth-taking mechanism and the ability of the mine cases to withstand the pressure when planted at the lower level (240 feet). The depth-taking performance was not particularly satisfactory, but the principal cause was discovered and remedied before the second excursion. Out of the 22 mines merged to a depth of 300 feet in fresh water 6 of them were crushed and leaks were discovered in 7 others. At 240 feet in fresh water no mines out of 38 planted were crushed and a leak was discovered in only one. It is probable, however, that the factor of safety of the mine case was so small that leaks might be started in adjacent mines by an explosion. This consideration made it desirable to increase the distance between mines from 250 feet, which was used on the first excursion, to 300 feet, which was employed on all following excursions.

The possible causes of premature explosions were many. Soluble washers which were designed to dissolve about 20 minutes after the mine had been planted were found to be very erratic, some of them dissolving in less than a minute after the mine had been planted. The antenna release mechanisms were not entirely satisfactory. Sometimes the shock of the mine striking the water was sufficient to release the floats allowing the antenna coils to foul the mine and fire it as soon as the soluble washer had dissolved. Leaks in the mine case could cause short circuits, which would operate the firing mechanism. In the original design of the mine it had included a circuit breaker in the antennæ circuit which prevented the mine from firing in case the antennæ fouled the mine case or the antenna floats carried away. The production of the circuit breakers had, however, been delayed, and none had been on hand for the first and second excursions. After carefully going over all the probable causes of premature explosions it was impossible to attribute them to any specific cause, and it was hoped that by using the utmost care in the assembly, adjustment, and planting of the mines the percentage of explosions would be further reduced.

After the completion of the second operation it was again necessary to await the receipt of mining material before the succeeding operation could take place. The Bureau of Ordnance had been requested by cable to ship antenna floats by a fast steamer as soon as a sufficient number could be obtained from the manufacturers in order to allow the mining to continue with as little delay as possible. Thirty-five hundred of these floats were shipped on the *Justica*, which arrived on July 10.

On July 6 information was received that several groups of American mines had been found on the Norwegian coast in the vicinity of Bergen. As it was most important to learn the cause of their breaking adrift, arrangements were made to send Lieut. O. W. Bagby, United States Navy, to Norway to obtain all the particulars available. His efforts were fruitless. The Norwegian Government would not permit him to inspect the mines they had recovered, and, after waiting several days, he returned to Base 18. Later information received stated that about 30 mines had been washed ashore and there were no signs of any mooring arrangements. This indicated clearly enough that the moorings had parted at the mine cases. The British had experienced similar difficulties and had found it necessary to use a spring buffer between the mooring cable and the mine case to prolong the life of their mines. Such a device would at least not be detrimental and might materially reduce the percentage of mines which were breaking away from their moorings, so the Admiralty were asked to supply us with the necessary buffers, which was promptly done.

Some of the mines recovered by the Norwegians were disassembled and the principle of the firing mechanism obtained. The Germans probably obtained the secret of our mine shortly afterwards, but, as far as can be learned, they took no defensive measures to protect their submarines while passing over the barrage.

In order to ascertain if the explosions were still continuing and if mines which had broken adrift were floating in the vicinity of the mine field, the *Patapasco* and *Patuxent* were sent out on July 9. After picking up the western end of the first excursion, several additional marker buoys were dropped and the tugs then steamed along the southern side of the United States fields laid in areas A and C. No explosions were heard nor were any floating mines observed.

The fourth British operation was carried out on July 12, again in area C.

Preparations were made for our third operation to commence on July 14. On July 11 a cable was received from the commander in chief, Grand Fleet, that mining was to be done to the westward of the Greenwich meridian. The excursion as originally planned was to extend from the leaving-off point to the first operation completely across area A, thus finishing the first system of mines. This change was

not serious so long as it was only temporary, although it was, of course, desirable to complete one fence of mines all the way across the North Sea as soon as possible. The question was taken up with the Admiralty by Admiral Sims and, in view of the fact that it was intended only as a temporary measure, it was acceded to.

The assembly and loading arrangements were altered, and by working night shifts it was possible for the squadron to adhere to the original date of readiness, getting underway for the third excursion on July 14. The following day 5,395 mines were laid in 4 hours and 22 minutes, the largest number so far laid in a single operation. By this time the mining installations had proved most flexible and reliable. Each ship was able to lay its entire quota of mines in one continuous string at a speed of 10 to 13 knots.

Approximately 5 per cent of the mines exploded prematurely—a slight increase over previous performances. This time it was definitely determined that part of the explosions were caused by countermining. On previous excursions groups had gone off almost simultaneously but it was generally thought to be more or less a freak occurrence of several mines individually exploding at practically the same time or due possibly to the reverberations of an explosion which sounded like several mines individually exploding at practically the same time when it really was but one. Now, however, it was proved beyond a doubt that one mine frequently was responsible for the detonation of several others. Curiously, mines sometimes as much as half a mile away were countermined, while the adjacent mines laid only 300 feet away remained intact. Upon completion of the operation, fog was encountered making it impossible for the ships to check their position while proceeding down the Scottish coast to Cromarty Firth. The swept channel was narrow and close inshore, which added to the difficulty by denying them the prerogative of keeping well clear of the coast. Unfortunately Capt. Belknap, commanding the mine squadron, had issued an order with respect to the danger of sounding, that caused three of the commanding officers not to sound. At 4.20 a. m., July 16, while just north of Cromarty Firth, one of the escorting destroyers sheered close in to the *San Francisco* and reported that they were too close inshore. The squadron turned out, stopped and backed but before headway had been checked the *Roanoke* and the *Canonicus* had grounded. The *Canonicus* was able to back off but attempts to clear the *Roanoke* were unsuccessful. She was lightened as much as possible and came off easily on the following high tide. No damage was sustained by either vessel. The commander of the mine force recommended no further proceedings and the matter was disposed of by Admiral Sims in a letter, in part as follows:

"The force commander is of the opinion that a court of inquiry should have investigated the causes for the grounding of the *Roanoke*, on July 16, 1918. It is, however, and has been, impracticable to order officers of sufficient rank, to compose such a court; it is noted that damage to the *Roanoke* and other vessels concerned, was slight, and that their availability for duty was not impaired.

"In view of the foregoing, no further action will be taken by the force commander, and the papers in the case will be forwarded to the Navy Department for such action as may be deemed expedient."

About this time the question of the length of antennæ again arose. It will be remembered that the original design of the mine called for antennæ 100 feet long. Early in 1918, however, data became available which showed that the mine charge was insufficient to do material damage to a submarine at this distance. The antennæ was then shortened to 70 feet. Later on further experiments showed even this distance to be too great to seriously cripple a submarine on the surface. It was therefore decided to reduce the length of the antennæ on the upper mine to 55 feet. This change had no sooner been decided on than actual experience showed it was desirable to still further reduce this length. The second week in July a German submarine while attempting to cross the mine field on the surface struck a mine, which exploded but did not do sufficient damage to prevent her reaching port. She reported her condition by radio, which was intercepted and deciphered. The Grand Fleet immediately dispatched fast vessels to attack her. She was able, however, to make sufficient speed to reach her base before this could be accomplished. Upon the representation of the commander in chief, Grand Fleet, and the desires of some of our own representatives, it was decided to further reduce the antennæ for surface mines to 35 feet, planting the mines 45 feet below the surface.

The fifth British operation was carried out on July 21 in area C.

Several days' delay was encountered before our fourth operation on account of again having to wait for mining material. The squadron was reported ready to sail July 25, but it was necessary to wait four days more for the escorting and supporting forces from the Grand Fleet. The British and American operations had recently been overlapping each other in such a manner that one squadron was out at sea while the

other was loading in port. As this necessitated keeping a large part of the Grand Fleet at sea almost constantly, the commander in chief desired that we should wait until the British squadron had again loaded, so that it would only be necessary to send one force to support both squadrons.

The antennæ for the surface mines were not shortened on this excursion, since the mines had already been assembled and loaded on board the layers. The squadron sailed on July 29, laying 5,399 mines the following day. The premature explosions were much more numerous than on any of the previous excursions, approximately 14 per cent of the mines going off. This was most disconcerting. Instead of the explosions decreasing as experience was gained in the assembly and laying of the mines, the percentage had been gradually increasing, and then had suddenly jumped to 14 per cent on this excursion. Losses of 3 to 4 per cent could possibly be tolerated, but this latter figure was absolutely prohibitive, and the causes of the explosions had to be definitely determined and eliminated.

The same date the mine layers left their bases Admiral Strauss, accompanied by Lieut. Noel Davis, left base 18 to represent the United States at an allied naval conference to be held at Malta to consider mine laying operations in the Mediterranean.

Due to the large number of premature explosions which occurred in the fourth operation, the force commander ordered the suspension of further mine laying operations until the cause of the explosions had been ascertained and corrected. All conceivable reasons which might be responsible were again gone over and further tests were conducted. Of these, two seemed to offer the only possibilities of solution. Circuit breakers had been used in the antennæ circuits for the first time. This device consisted of a mercury cup which broke the circuit in case the antennæ was not released from the mine, or if the floats were carried away allowing the antennæ to drop down upon the case. In what adverse manner the circuit breaker might affect the firing device could not be imagined, still, there was a possibility that it was at least partially to blame. The other cause was believed to be due to difficulties in installing the horn bushings in the mine case. Unless this was most carefully done there was danger of grounding the circuit of the firing device on the mine case which would cause the mine to fire as soon as the soluble washer had dissolved.

Believing that the difficulties could be most quickly solved by actual planting, arrangements were made for the next excursion to begin on August 8. Mines were assembled with the electric circuits to the horns disconnected, but in all other respects the same as before.

This was again a joint excursion by the British and American squadrons, the British laying surface mines in area C to the southward of those laid by us on July 1. This was a departure from the original scheme by which the British were only to lay deep mines in this area, but it was in line with the recent change in policy that the surfaces should be more densely mined than the lower depths. Besides this, all our mines had been laid in area C had 70-foot antennæ which were unquestionably too long to insure the destruction of submarines on the surface.

The efforts to cure the premature explosions on this excursion were found even less successful than before. After laying 1,596 mines the operation was discontinued and the squadron returned to the bases. Approximately 19 per cent of the mines had exploded.

Evidently the horn circuit could not be at fault and it must be something else. Numerous experiments were again carried out in hopes of discovering the secret of the explosions and another possible cause was developed. It was found that the rubber insulation between the copper plates on the firing device caused sulphates and sulphides to be formed with the copper which, when immersed in salt water, set up a slight current in the firing circuit in the direction necessary to operate it. Although the current was in most cases small, there was a possibility that if it were eliminated the mines would then have sufficient stability so as not to explode after they had been planted.

In order to carry out the practical part of the experiments after the theoretical tests had been completed at the bases, the *San Francisco* proceeded to the mine field on the 12th of August. The copper plates of the K71 devices were carefully cleaned and circuit breakers were fitted on half of the 166 mines which were to be planted. Seven of this number exploded prematurely, four of which were due to the antennæ fouling the mine cases. In order to obtain definite data in regard to countermining the mines were set to fire as soon as the soluble washers dissolved. Each of these caused one additional mine to explode. A depth charge was also dropped in the vicinity of the field which caused six mines to go off. •

The improvement obtained in this test was sufficient to enable mine laying to be resumed after cleaning the copper plates on all mines. It was further decided to omit the circuit breakers as they were additional complications of unknown value. The

upper horns of the mines were also shortened to mere points to reduce the possibility of the antennæ becoming hooked around them.

The squadron sailed on the sixth excursion on August 18 and the mine laying was completed on the 19th. The British squadron proceeded at the same time to complete our lines of surface mines in area C. Twelve per cent of our mines exploded prematurely. The majority of these were due to countermining. The real cause of the premature firing evidently had not yet been discovered, but the improvement obtained was sufficiently encouraging to permit another attempt to be made.

On August 5 the commander in chief Grand Fleet lifted restrictions he had placed on mining to the westward of the Greenwich meridian. The next excursion was correspondingly planned to complete the first fence of mines across area A.

Admiral Strauss returned from the Malta conference on 22d of August. After the excursion another probable cause of the premature firing was discovered which proved to be the final solution of the difficulties. The first lots of firing devices shipped to the bases were adjusted to fire at a voltage between 25 and 40 millivolts. The Bureau of Ordnance decided, from experiments conducted in the United States, that this voltage was unnecessarily high and reduced it so that the mines would fire between 10 and 25 millivolts. It was not known when this later type of firing device first began to be installed. The original type was undoubtedly used on the first three excursions when a comparatively low percentage of the mines exploded. After that it was probable that the majority of the mines were assembled with the firing devices which had been adjusted to fire at the lower voltage.

It was therefore decided that on the seventh excursion the first 600 mines planted should be adjusted to fire between 20 and 35 millivolts; then, if the observations on this part of the field indicated sufficient improvement, this adjustment should be used on subsequent excursions.

The squadron got under way 26th of August and stood out toward the mine field. The *Saranac* broke down shortly after leaving the base and had to return to Inverness with her full cargo of mines. The remaining nine ships, however, continued and carried out the operation. Unfortunately dense fog was encountered practically throughout the operation, so thick at times that it was impossible for the vessels to see the next ship abeam, distant only 500 yards. These conditions made observations extremely difficult for the *Patapsco* and *Patuxent*, which were sent out with the squadron to follow astern while planting was in progress and count the explosions to determine the percentage which occurred. From the data obtained from the mine layers and the tugs it appeared that only about 3 per cent of the first mines exploded prematurely. In the remainder of the field, which had the low-voltage regulation, approximately 12 per cent went off.

The adjustment of the firing device was undoubtedly the solution we had sought for, but in order to test it further and to complete the deficiency in this field caused by the breakdown of the *Saranac*, the *Shawmut* and *Aroostook* were loaded with mines adjusted to fire between 20 and 35 millivolts and sent out on August 30. Of the 600 mines they planted, only 3 per cent exploded. This was the first opportunity we had had to use these two vessels for their originally intended purpose; that is, as a fast wing to the mining squadron. Both ships proceeded to the field and planted their full quotas at a speed of 17 knots with no difficulty. They could plant as easily at their maximum speed as they could at 12 knots.

This final solution of the premature explosions was a great relief. It explained, in addition, the probable reason for countermining. The tests conducted to ascertain the effect of the copper sulphate deposits on the plates of the firing device showed that as much as 10 millivolts could be generated. This was sufficient to rotate the armature of the firing device through a considerable portion of its arc so that a slight additional shock, which might readily be caused by the explosion of a nearby mine, would be sufficient to shake the firing ball from its cup and detonate the mine. By increasing the tension of the hair spring on the armature, the voltage necessary to fire a mine could be raised to the desired amount.

In the latter part of August information was received that another enemy submarine was damaged while attempting to cross our barrage, and had been compelled to return to its base on the surface. These repeated instances of submarines deprived of their principal means of defense pointed more strongly than ever to the necessity of having patrol vessels stationed at intervals along the barrage to attack submarines which had encountered mines but had not been completely destroyed.

The question of mining area B again came up and a decision was finally reached to mine it with both surface mines and deep mines. The commander in chief, grand fleet, however, objected to mining completely up to the Orkney Islands, and it was decided that a gate 10 miles in width would be left which should be closed later when conditions indicated this step to be necessary.

The mines which had been laid in this area by the British in March, 1918, had in the meantime been swept up. The British had also placed a series of mine nets to the southward of area B, extending part of the way between the western end of area B and Duncansby Head. These had not proved successful and were also removed before the mining in area B was resumed.

The eighth excursion was intended as a surprise excursion. Neutral nations had not been notified that area B was dangerous to shipping, and with this knowledge enemy submarines were constantly passing through it on their way to the Atlantic. It was accordingly decided not to notify the area but to secretly route all shipping so as to avoid it, with the hope that submarines might still attempt to use it after it had been mined. In order to prevent the enemy observing the mining while it was in progress, an elaborate patrol was arranged, beginning the day before the operation and continuing until after its completion.

British and American mining squadrons rendezvoused off the Orkney Islands on September the 7th and proceeded to carry out the operation. We laid six lines of surface mines across area B while the British laid one line of surface mines parallel to ours. This was really the first joint operation carried out by the British and American squadrons. On several previous occasions both squadrons had been at sea at the same time, but had not been working side by side, so as to necessitate appointing one officer to command the expedition. On this occasion Admiral Strauss was designated to take general charge of both squadrons while mining was in progress.

In spite of the high voltage adjustment of the firing devices, 13 per cent of the mines exploded. About five-sixths of this number were due to countermining, indicating that the mines were still too sensitive and that the voltage must be still further increased. Tests that had been made indicated that contact of the antennae with the hull of the ship invariably gave voltages about 100 millivolts, and it was therefore considered entirely safe to further increase the adjustment of the firing device to operate between 30 and 45 millivolts. This was done for all subsequent excursions.

An interesting sidelight on the activities of the mine force were the tests and experiments which were almost constantly in progress. Besides the difficulties encountered in solving the problem of premature explosions, numerous other questions arose in connection with the new American mine. The facilities at hand were ideal for mining experiments. The chain of lakes forming the principal part of the Caledonian Canal, which terminated at base 18, offered smooth water with depths varying up to 800 feet, which corresponded to the maximum depth encountered in the North Sea barrage. The only drawback was that the water was fresh instead of salt. During July, the British had conducted a series of experiments to ascertain the accuracy with which their mines took their prescribed depth. The results were not entirely satisfactory, and since our mine anchor had been largely copied from the one they were using, it was also probable that ours were not behaving as designed. Tests were carried out in Loch Lochy during the first week in September when 50 mines were planted with anchors adjusted to moor the mine 45 feet below the surface. The average depth actually taken was 44.6 feet. The shallowest mine was 39.2 feet and the deepest one at 48.7 feet. The results were entirely satisfactory and were all that could be expected.

All the mines which had thus far been laid in area B were surface mines, and since this was still the weakest part of the barrage, it was decided that the following excursion should also be placed in this area, laying two rows of mines at each of the three standard depths.

A delay of nine days was occasioned waiting on the British mining squadron, since it was desired that both the British and American squadrons should lay their mines on the same date in order to reduce the possibility of the enemy observing mining operations in this area. Delays of this nature were most serious. It was realized that mine laying operations would be interfered with if not altogether stopped during the winter months on account of the severity and frequency of the storms in the North Sea. It was also extremely desirable to complete the barrage at the earliest possible date in order that operations in the Mediterranean might be undertaken.

The work of assembling mines at the bases, refueling the ships, and embarking new loads of mines had reached such a stage of efficiency that it was possible to reduce the length of time that it was necessary for the ships to remain in port to two days. The vessels were ordinarily away from the bases two or three days, thus making it possible to complete an operation every four or five days. At the same time mines were being shipped at a faster rate from the United States, in anticipation of the speed with which they could be laid. Delays therefore caused most serious complications at the bases on account of the difficulty of stowing the material in the limited space provided. Another phase which should not be overlooked was the effect on the morale

of the personnel aboard the mine layers. It was always necessary to load the layers as soon as possible after their return to port since delays could seldom be foreseen. This resulted in the vessels remaining in harbor with cargoes of mines on board for a considerable period of time. This caused serious inconvenience to the personnel since practically all of the living space on board was occupied by mines, making it necessary for the men to sleep on deck between the tracks or wherever it was possible to find sufficient space to spread a hammock. Messing arrangements as well as nearly all of the other accommodations existing on board ship were badly interfered with. These delays became more frequent and of longer duration as the completion of the barrage drew near. Sometimes it was due to having to wait while the British squadron was being loaded, but more frequently was attributed to movements of the Grand Fleet making it impossible to supply the necessary destroyers to act as our escort. Had it been possible to obtain sufficient of our own destroyers for this purpose it could have enabled the barrage to have been completed by approximately the 1st of October.

In the early morning of September 20, while the United States mining squadron was on its way to the mine field to carry out the ninth excursion, a submarine was sighted off Stronsay Firth. She was immediately attacked with depth charges by the escorting destroyers and at the same time a smoke screen was put out by both the escort and the mine layers. Shortly afterwards she was again sighted just ahead of the *San Francisco* and was again attacked. The behavior of the submarine was most unusual. Although both times she was sighted she was in good position and at a comparatively close range no attempt was made to fire a torpedo. It is highly probable that she had been sent to this position to the southwestward of the lines of mines which had shortly before been laid in area B, in order that she might make observations of the positions in which mines were being laid in this area.

The squadron proceeded through Westray Firth and thence to a position about 6 miles to the northward of the western end of the field which was laid on the 7th of September, where the mining began. In this excursion, 5,520 mines were laid in 3 hours and 50 minutes—the record number that has ever been laid by a mine-laying force in a single operation. At the same time, the British squadron laid 1,300 mines in a single line parallel and to the northward of those laid by us. Rear Admiral Strauss was in command of the United States layers on board the *San Francisco*. Rear Admiral Clinton Baker commanded the whole expedition.

During the mine-laying, when about midway between the ends of the previous field which had been laid in area B, one of the escorting destroyers sighted the body of a dead sailor floating in the water. He was recognized to be a German by the type of life preserver he wore. Since no engagements with the enemy had occurred within miles of this position, it is extremely probable that an enemy submarine had been destroyed by one of the mines which had been laid on September 7.

The reduction of premature explosions on this excursion was a marked improvement, being between 5 and 6 per cent as compared with 13 per cent on the previous operation. The firing devices had been adjusted to operate between 30 and 45 millivolts, and this regulation could not readily be increased, on account of the construction of the mechanism. It was perhaps as well that it should not be further raised, as the mine might be possibly made too sensitive to operate when a poor contact was made by the antennæ.

After completing the ninth excursion, work was resumed in area A. On September 27, 5,450 mines were laid, slightly over 4 per cent of which exploded prematurely. Only nine of the mine layers took part in this operation.

On account of the great depths of water in which it would be necessary to lay mines in the Mediterranean, it was necessary to develop a special type of mine. A satisfactory design had been evolved by the Bureau of Ordnance, but it was essential to conduct a series of practical tests before beginning the manufacture. No vessel was available in the United States for this purpose, so the *Baltimore* was ordered home to carry out the required experiments. She proceeded as far as Pentland Firth in company with the squadron on their way to the mine field for the tenth excursion, where she was detached to Scapa Flow to obtain routing instructions across the Atlantic from the commander in chief grand fleet.

The eleventh operation was carried out on October 4, again in area A, and approximately 6 per cent of the mines exploded prematurely. Losses up to this amount had, however, come to be accepted as normal for this type of mine. The Bureau of Ordnance also considered this figure a reasonable loss on account of the various defects which are invariably encountered in the production of material in such vast quantities.

Since the operation in the Mediterranean would probably have kept the mine force engaged until well into the summer of 1919, it was considered advisable to have the mine layers docked prior to their departure for those waters, where such facilities would

be extremely limited. After the completion of the eleventh excursion the *Shamrock* and *Aroostook* were detached from the squadron and proceeded to Newcastle-on-Tyne for this purpose. It was intended to send two vessels there after each operation, having them return in time to take part in the second following excursion. Permission was obtained for the ships' crews to do the work in connection with scraping and painting the ship's bottoms—an arrangement which had been found to very materially expedite the time required for docking.

With the mining of area B, the problem of enemy submarines gaining access to the Atlantic became serious. Several submarines had encountered mines in the barrage but had managed to reach their bases bearing material evidence of the existence of the barrier. It was only natural, therefore, that the enemy should look about for whatever means remained of reaching the Atlantic without risking passage across the mine fields. Small submarines occasionally successfully ran the blockade at the Dover Channel, but this was apparently not attempted by the larger boats. Pentland Firth and the 10-mile gate to the eastward of the Orkneys were heavily patrolled. Submarines evidently would not risk passage through Pentland Firth while submerged on account of the dangerous currents. The only remaining passage was through Norwegian territorial waters. Although Norway had issued a proclamation that belligerent submarines using her waters for this purpose would be fired upon, this risk seemed less than any of the others and there was no apparent hesitancy in using it. One enemy submarine while passing through these waters even went so far as to stop on a Norwegian vessel. These repeated violations resulted in a statement on September 29 by the Norwegian Government that mines would be laid in the vicinity of Udsire Island in order to prevent belligerent vessels using her territorial waters for purposes contrary to the provisions of international law. This mining is understood to have been completed by them about the 7th of October and had the effect of completing the barrage from the end of area C to the Norwegian coast.

On October 11 the British squadron laid two partial rows of surface mines in the southwestern portion of area B. These proved to be the last mines laid by them in the North Sea barrage prior to the armistice a month later.

The United States mining squadron completed the twelfth excursion on the 13th of October, losing 4 per cent by premature explosions. The *Roanoke* and *Canandaigua* proceeded to Newcastle for docking upon the completion of the operation.

Eight days' delay were encountered before the 13th and last operation could begin. On account of the sequence of the British and American operations in areas A and B it had been impractical to extend the mine fields so as to overlap each other. This left a gap between the two areas approximately 6 miles wide. In order to close this the next excursion was planned to consist of six rows of surface mines to the southward of the gap, continuing with two rows into area C so as to complete the four rows which the United States had agreed to lay in this area.

The first of the winter weather was encountered in this operation, when it was necessary for the squadron to wait one day after having reached the mine field before the sea moderated sufficiently to enable the mines to be laid. Even then the ships were rolling as much as twenty to thirty degrees on each side of the vertical. This provided an excellent test of the mining installations with the result that no difficulties were encountered by any of the ships, either in the stowing of their mines or in the actual planting under such severe conditions. The operation was completed October 20, having laid 3,760 mines, of which slightly over 4 per cent were lost by premature explosions.

Although the United States mining squadron was again ready for the next excursion by October 30, it was necessary to wait until the British squadron had completed the operation which they had planned before escort could be furnished us. Reliable information indicated that enemy submarines were crossing the eastern portion of area A, and the British had decided to lay surface mines in this position to the southward of those laid on our first excursion so as to strengthen this part of the field which was the least effectively mined part of the area. Weather conditions, however, prevented them from going out for several days, and, in the meantime, the series of events during the latter part of October and 1st of November brought the end of the war so plainly in view that further mining would have been an unnecessary waste of time, effort, and material. The British squadron did not carry out their contemplated operation, nor likewise did we. With the signing of the armistice on November 11 with Germany—the perpetrator of ruthless submarine warfare against both allied and neutral commerce—came the end of building the North Sea mine barrage.

CHAPTER XVII.—FINAL STATUS OF BARRAGE AND RESULTS OBTAINED.

On November 11, 1918, when hostilities ceased, upon the signing of the armistice, status of the northern barrage, as set forth in an Allied Naval Council Annual report, dated December 16, 1918, was as follows:

The northern barrage extends from Norwegian territorial waters to within 10 miles of the Orkney Islands, and lies in the area contained by the following positions:

60° N., 4° 54½' E.
 60° 21' N., 3° 10' E.
 59° 30' N., 50' W.
 59° 20' N., 2° 5' W.
 58° 50' N., 2° 27' W.
 58° 50' N., 50' W.
 59° 24' N., 3° 10' E.
 59° 12½' N., 4° 49' E.

2. The barrage has been divided into three areas, A, B, and C. Area C extends from Norwegian territorial waters to the meridian of 3° 10' E. Area A extends from the meridian to 5' W., and area B from the western extremity of area A to within 10 miles of the Orkneys.

3. Mine laying operations were commenced in March, 1918, by Great Britain, and in May, 1918, by the United States of America, British and American mines being used. Up to November 11 a total of 56,760 United States and 16,300 British mines have been laid.

4. The original intention was, that the United States mine layers should lay the mines in area A, and the British mine layers in areas B and C, and this arrangement has for the main been adhered to, but a certain number of United States mines have also been laid in areas B and C. This was done in order the more effectively to deal with the submarine situation at the moment, and to make the best use of the greater mine-laying capacity of the United States mine layers.

5. The completion of the barrage within Norwegian territorial waters has been effected by Norway herself.

In July, 1918, conclusive evidence was obtained that German submarines were actually using Norwegian territorial waters. Representations were made by the British Government to the Norwegian Government that the only effectual way of ending the observance by Germany of the Norwegian Royal Decree was for Norway herself to mine these waters herself, or to allow the allied and United States Governments. After protracted negotiations, during which evidence as to the identity of submarines reported on various dates to have been seen in Norwegian territorial waters was furnished to the Norwegian Government, a note was received from the Norwegian Government, by the allied and associated governments on the 28th September protesting against the violation of Norwegian regulations by a British submarine in a case which had been previously admitted by Great Britain and stating in view of the numerous cases of infringement of her territorial waters by submarines which had been established with certainty, it had been decided to lay mines in certain localities.

On 29th September, 1918, an official announcement appeared in the leading Norwegian Government organ to the effect that mines would be laid in Norwegian waters between latitudes 59° 8' N. and 59° 25' N., and to the westward of longitude 4° E., and that these waters would be closed for general traffic from 7th October.

AREA A.

The depth of water in this area is from 50 to 80 fathoms. The approved minefields in this area will, when completed, consist generally of three lines of United States mines, dangerous to surface craft and to submarines at surface depth.

Three lines of United States mines, at a depth of 160 feet, the mines having a dangerous area above the mines of 70 feet.

Three lines of United States mines, at a depth of 240 feet, with a similar dangerous area.

More operations were required to complete the approved minelaying in this area.

Any reinforcement of the minefields in area A would depend on the submarine situation at the time.

AREA B.

8. The depth of water is from 40 to 75 fathoms. At the present time the following lines of mines have been laid across the area:

One line of British mines dangerous to surface craft.

One line of British mines at 95 feet deep.

Eight lines of United States mines dangerous to surface craft and to submarines at periscope depth.

Two lines of United States mines at 160 feet deep, having a dangerous area (about the mines) of 70 feet.

Two lines of United States mines, at a depth of 240 feet, with a similar dangerous area.

Two further lines of British mines have been commenced across the area. The submarine situation will determine any future action in this area.

AREA C.

9. The depth of water is from 65 to 160 fathoms. At the present time the following lines of mines have been laid across area C:

Two lines of British mines dangerous to surface craft.

Two lines of British mines at 65 feet deep.

Two lines of British mines at 95 feet deep.

Two lines of British mines at 125 feet deep.

Four lines of United States mines dangerous to surface craft and to submarines at periscope depth.

Six lines of United States mines dangerous to surface craft and to submarines at periscope depth have been laid across the junction line between areas A and C.

Any further mining in area C will depend upon the submarine situation at the time.

GATES.

10. There are no gates in the barrage, the only free passage through being the 10-mile gap at its western extremity which, however, is not used more than is absolutely necessary.

PATROL.

11. The barrage is not patrolled.

Rear Admiral Strauss has summoned up the final status of the operation and the results obtained from it is as follows:

Had it been possible to carry out mine-laying operations as fast as the necessary mining material was received and assembled, the American portion of the North Sea barrage could have been completed by the latter part of September, 1918. The frequent delays, especially during the latter part of the work, which were principally due to the necessity of awaiting for escort to be supplied by the Grand Fleet, or for the British mine squadron to complete its preparations so as to be able to go out at the same time, prevented the barrage from being completed prior to the signing of the armistice with Germany on November 11.

In all, 70,263 mines were laid, 56,611 being American mines, laid by the United States mining squadron, area A, which was originally allotted as the United States portion of the barrage, was completed except for 6,400 mines more, which could have been laid in approximately 10 days. Besides mining area A exclusively, the United States mining squadron had laid 10,440 mines in area B, and 5,980 mines in area C. Thus it will be seen that in addition to mining the part of the barrage originally assigned to the United States Government, we had in addition laid more mines in the British areas, B and C, than they themselves had put down. One more small excursion in area B by the United States mine force would have given it the same density of American mines as area A. Area C was the weakest portion of the barrage. The British had originally agreed to mine this area only to a depth of 200 feet but were only able to complete the work to a depth of 125 feet. This figure was just one-half the effective depth of the remainder of the barrage.

Until the animosity incident to warfare has disappeared and the freedom of discussion of war-time secrets can be attained, it will be impossible to accurately determine the actual results achieved by the North Sea barrage. Such information as has been possible to collect bears witness to its efficacy notwithstanding the short time the barrage was in operation.

After the first two American excursions had been completed, two enemy submarines were damaged in attempting to cross area C. The first, the U-86, was damaged

on July 9 while passing homeward, reaching port successfully and bearing tangible proof that the North Sea barrage was a reality and not a threat. The other, the U-22, was to have passed, but nothing has been heard from her since. The enemy of course immediately routed his submarines through area B, which had not been proclaimed, or through Norwegian territorial waters. On August 10, U-115 was damaged in the barrage on an outward bound trip and was forced to turn back. The surprise mining in area B on September 7 obtained immediate results. It will be remembered that when it was decided to place mines in this area no notification was given to neutral nations that it would be dangerous to navigation. Instead a heavy patrol was placed around the area to guard it and keep down enemy submarines while mines were being laid. Just prior to the mining operations a large convoy was routed across this area in order to deceive enemy submarines which might possibly have seen the convoy and thus lead the enemy to believe that this area was to be maintained free of mines. On September 8, the day following that on which the mines were laid, the U-92 was sunk in this area while another submarine was so severely damaged that it was forced to return to its base immediately. This occurred while the submarine was outward bound. Rather than risk a passage again through the same waters, she proceeded to area A, recrossing the barrage in that position without further damage.

After this it appeared that passages were attempted directly across area A, which, due to the United States participating in the mining of areas C and B, was comparatively poorly mined. The tenth, eleventh, and twelfth excursions, however, during the latter part of September, and the first part of October, added a great deal to the effectiveness of area A, so that the loss of U-156 on September 25 and U-123 on October 18 can most certainly be attributed to this area.

With the information at present available, it appears that a total of 6 submarines were destroyed in the barrage and possibly an equal number were severely damaged. On account of the difficulty of obtaining accurate information, such a short time after the armistice was signed, it is highly probable that subsequent data will show even greater damage to have been done.

It is well to remember that a mine barrage of this nature can never be an absolute barrier possessing 100 per cent efficiency. On account of the necessity of laying the mines at a distance of approximately 300 feet apart in order to reduce the possibility of countermining, it would always be possible for a submarine with a beam of approximately 30 feet to successfully cross such a barrier no matter how many parallel lines of mines may be laid. The danger in crossing, of course, increases with the number of rows of mines but not in direct proportion. The object, then, in constructing a barrage must be to make the danger incurred by the passage of a vessel sufficiently great to prevent submarines from taking the risk involved. The American portion of the barrage was designed to offer the following resistances to the passage of submarines.

A vessel passing on the surface or submerged above a depth of 50 feet stood one chance in three of making a successful passage; submarines passing submerged between depths of 50 feet and 250 feet had approximately two chances out of three of passing the barrage without encountering a mine.

The object of making the passage across the surface barrage more dangerous than at the lower levels was largely psychological, for even though a submarine which was forced to cross the barrage might know that the danger on the surface was the greatest, the moral factors involved were usually sufficient to induce them to accept the greater hazard on the surface rather than face the danger of striking a mine while submerged.

In connection with the enemy's attitude toward antisubmarine measures taken by the Allies, it is interesting to note the statement of a captured German submarine commander who had had considerable experience on that particular type of vessel. He expressed the opinion that of all the antisubmarine measures which had been taken, mines were by far the most dreaded by the German submarine personnel, principally because there was nothing to indicate their presence. Also because the quality of allied mines had recently been improved in a most unpleasant manner; the former practice of fishing them up and taking them home for conversion into punch bowls for submarine messes had now been entirely abandoned, he said.

One feature of the barrage which offered several possibilities but was never more than partially put into operation was the question of patrols to guard the mine field to force submarines into the deep mines and destroy those which had not been completely disabled. This measure had been argued for from the very beginning, although no definite agreements were ever reached. The first arrangement was that areas B and C should be deep mined only and that the surface should be guarded with patrols. Area B was not mined, however, until comparatively late in the work on the barrage and during this time was only indifferently patrolled, thus affording a comparatively safe passage for enemy submarines through this area. The United States Government

had been asked to lay two rows of surface mines in area C early in the history of active operations and this had been done on July 1. Two lines of mines, however, formed a very ineffective barrier and patrols in this area would have been of the greatest assistance, not only in driving submarines into the lower level mines, which were more closely spaced but also in preventing submarines from using Norwegian territorial waters to get by the barrage. This latter measure could have been effected by hydrophone vessels lying outside the Norwegian territorial waters where enemy submarines could easily have been detected when attempting such a passage. The question of patrols, especially for catching crippled submarines after it became known that many of them were not disabled when exploding a mine at a distance of 70 feet, arose continuously but on account of the tremendous demands for such vessels both for active submarine work in other waters and for escorting coastwise convoys, it was impossible to obtain any vessels for this purpose.

Although the enemy undoubtedly obtained the secret of the American mine story after the first mines were washed ashore and recovered in Norway in the early part of July, it is interesting to note that apparently no attempt was made to fit their submarines with protective devices which would have enabled them to pass safely through the American mine fields. Such a device, although it was unknown until after the armistice, was readily devised when the necessity arose for protecting vessels which would be employed in clearing the North Sea of mines after the end of the war.

Information had also been received indicating that the Germans had built special vessels called mine barrier breakers of a practically unsinkable character, so that they could be used to clear passages through mine fields. Evidently none of these vessels attempted operations in the North Sea barrage.

The mine as a weapon of nautical warfare now presents greater possibilities than ever before. The United States in less than one year was able to construct a squadron of mine layers and produce sufficient mines to keep them constantly employed, laying on each excursion in less than four hours more mines than the United States had ever possessed prior to her entry into this great war. Too much credit can not be given to those who designed the mine. Clever, simple, and effective, this mine proved, perhaps, the most efficient single weapon against the enemy's submarines. Equally as remarkable as the invention of the mine itself was the development and production by the Bureau of Ordnance. Any complicated instrument of this nature ordinarily requires years of experiments and modifications before it finally becomes sufficiently satisfactory and reliable to allow it to be used. Time, however, was the supreme factor. Every minute counted in order to save the merchant shipping and the wise forethought and judgment of those to whom the production of the mine was intrusted should go down in history as one of the most worthy achievements of the war. Minor defects and difficulties, of course, were encountered in the actual operation and handling of the mines, but these were also met and solved on the spot by the United States mine force.

Mine laying, like the havoc wrought upon the battle fields by the destruction of property, leaves its effects to be felt after peace is obtained. Thousands upon thousands of mines have been laid in European waters, a major portion of the work being concentrated in the North Sea barrage. With the cessation of hostilities and the resumption of free shipping these mines constitute an ever present danger to the vessels on the seas. Many of them break adrift and, carried by the wind and tide, often appear in waters which were thought to be clear of mines. One of the first steps after the armistice was to divide the work of clearing the seas among the various nations involved. At an allied naval conference the United States volunteered to remove all mines which they had laid and arrangements were immediately taken in hand to carry out this work. A method of sweeping this peculiar mine, together with the development and the organization of the force required, had been completed and actual sweeping operations were commenced before the treaty of peace had been signed.

APPENDIXES.

APPENDIX B.

Confidential.

JUNE 1, 1917.

From: Commander S. P. Fullinwider, United States Navy (retired).

To: The Secretary of the Navy (Chief of Naval Operations).

Via: Chief of Bureau of Ordnance.

Subject: Proposed plan of American operations in the war.

1. In accordance with article 1534 (4) United States Navy Regulations the following brief plan of operations is suggested for consideration.

2. From published information regarding prospective war measures of the United States, I gather that our Government intends to send an army of 500,000 or more men

reenforce the Franco-British lines in France. It is suggested that, while this is a moral and popular measure, its execution will involve very grave difficulties for the following reasons:

a) There is little doubt that Germany is constructing submarines faster than they are being destroyed. If this be true, one is forced to the conclusion that, unless some more successful means is quickly found to curb the submarine menace, Great Britain and France will be defeated if Germany can prolong the war.

b) Plans for bottling up the enemy's submarines by means of a mine barrier from Scotland to Norway and across the English Channel are under consideration, but the success of such a plan is problematical and can not be definitely relied upon. At any rate it could not be carried into full effect inside of six months. Therefore the difficulty of supplying Great Britain and France with munitions and food is bound to increase until next spring if not indefinitely.

c) If in the next few months we send a half million men to the "west front," we will increase very greatly the heavy burden of the Atlantic transport systems since we would have to supply our Army with all the supplies and munitions it would require.

d) The loss of some American transports with thousands of men might have a very grave effect on American public opinion and would correspondingly encourage the German people.

e) If Russia should fail us and make a separate peace, Germany would be able to secure supplies from the east in abundance and would grow stronger actually and relatively.

3. If, instead of sending more than a division or so to France, we were to send 500,000 or 1,000,000 men to the "east front," say, to Galicia or Roumania, many of the above-mentioned difficulties would disappear and victory would be more assured for the following reasons:

a) While our line of communications via Vladivostok to the east front would be very long, it would be absolutely safe, since it is not conceivable that Germany can extend her submarine warfare to the Pacific for lack of bases. The distance from Puget Sound to Vladivostok is only about 1,500 miles greater than from New York to England or France. The rail route from Vladivostok to the front presents a problem, but Russia in her war with Japan transported to Manchuria and supplied an army of half million men on a single-track road, and that road is now double-tracked for the most part.

b) By physical as well as moral and financial backing we would probably hold Russia firmly in line and prevent any possibility of a separate peace on her part.

c) An American army in Russia, would obtain the greater part of its supplies, except munitions from Russia, thus relieving us of the necessity of shipping great quantities of provisions and other supplies from this country. It should be practicable also to establish American munition factories in Russia to help supply our Army, thus still further simplifying the transport problem.

d) An American army in Russia would account for a greater German force than could the same army on the west front, owing to the difference in conditions in the two fronts, and thus the pressure on the French and British lines would be greatly reduced.

e) A successful American-Russian campaign on the east front would give greater assurance of saving Roumania and Serbia.

f) The post-bellum relations between Russia and the United States would be all that could be desired as a result of close cooperation in a victorious war.

g) Russia and the world would be freed of the danger of a German ascendancy in her economic life.

h) Japan would be forced "to show her hand," which might be desirable or not, according to the point of view. In all probability Japan would decide that it would be in her interest also to put an army in the field alongside ours.

i) For transports in the Pacific we could utilize, of course, the *Vaterland* and other passenger ships. We could use for this service also wooden ships and others that are undesirable or unsafe for transport or freight service in the danger zones of the Atlantic. Possibly also Japanese ships would be available as transports.

j) Transports, instead of returning home empty, probably could bring cargoes of provisions from Russia, thereby reducing the drain on our food resources.

4. I think that we may assume without question that Great Britain and France could hold their present lines until such time as we could place a million men on the east front; then victory would come quickly, much quicker than if we try to fight it out on the west front, leaving Russia to "find herself" unaided.

5. To summarize, I suggest that our plan for the further prosecution of the war should be:

- (a) Send a large army to Russia.
- (b) Close the North Sea by means of mine barriers.
- (c) Continue and increase our operations against submarines in the open sea.
- (d) Build as many cargo ships as possible.
- (e) Give the Franco-British forces a decisive preponderance in air craft..
- (f) Give the American-Russian forces on the east front supremacy in the air as well as on land.

S. P. FULLINWIDER.

APPENDIX C.

DEPARTMENT OF THE NAVY,
GENERAL BOARD,
Washington, October 24, 1917.

Confidential.

From: Senior member General Board.

To: Secretary of the Navy.

Subject: Proposed measures to prevent German submarines from operating against allied commerce in the Atlantic.

Inclosures: (a) Memorandum dated October 23, 1917, by Capt. R. R. Belknap, United States Navy, re proposed mine barrage, Scotland to Norway; (b) General Board letter No. 425 (serial No. 776) of October 20, 1917, inquiry re mine barrier across North Sea; (c) memorandum of October 23, 1917, from British Embassy quoting Admiralty reply to reference (b). (d) Memorandum of October 18, 1917, from Chief of Naval Staff to Chief of Naval Operations re mines and cooperation of United States in mining operations. (e) General Board letter No. 425-5 (serial No. 777) of October 22, 1917, plans for opposing enemy submarine activity in Atlantic trade routes by mine barrage at entrances to North Sea.

1. The General Board has been requested by the Navy Department to consider the possible offensive operations against German submarines bases and to recommend that form of offensive which, in cooperation with the British naval forces, promises to most quickly and effectively limit submarine depredations upon allied commerce.

2. German submarines now operate from bases in three widely separated localities Kiel Bay in the Baltic; Helgoland Island and the mouths of the rivers emptying into the North Sea; and from the Zeebrugge-Ostend region on the Belgian coast. Submarine operations are much facilitated by the safe passage afforded in neutral waters through the Kettegat and Skagerrack from bases on Kiel Bay; and boats leaving the Helgoland region or Belgian coast pass into the Atlantic through the Dover Strait or around Scotland. The situation is further complicated by the Kiel Canal, by which submarines may operate either from Helgoland Bight or Kiel Bay.

3. Obviously the most effective method of combating submarines is to stop them, if practicable, at their bases. Failing this, to take preventive measures as near these bases as possible before they have had an opportunity to scatter on the trade routes. If neither of these measures is practicable, submarines must be hunted down in the open sea by the methods now employed.

4. The offensive against submarine bases may take three forms: (1) An attack by heavy ships, smaller surface craft, submarines, and aircraft, with a view to the occupation or destruction of such bases; (2) closing outlets to them by channel obstructions, mines, and a close surface and submarine blockade; (3) by the construction and maintenance of more distant mine barriers which will prevent the passage of submarines into the North Sea or into the Atlantic.

5. Each of these operations has its distinctive advantages and disadvantage for each locality, and a choice and recommendation of the most practicable under the conditions of this war follows by a process of elimination from a consideration of each on its merits and in the light of three years' war experience.

6. *Mission of the United States.*—In cooperation with allied forces to prevent German submarines from operating against allied commerce.

7. *Enemy strength, dispositions and probable intentions.*—(1) Submarines now operate from German bases on the Baltic, from bases in Helgoland Bight and from bases in the Zeebrugge-Ostend region, Belgium.

(2) Nothing is known of the batteries protecting Helgoland and the adjacent coast from the heavy batteries, over 200 guns of 4-inch caliber and above on the Belgian coast about Ostend and Zeebrugge, which protect Zebrugge effectively against attack

in the sea, it must be assumed that even heavier and more formidable batteries have been devoted to the defense of the vastly more important Helgoland region. It is known that the sea area of Helgoland Bight is extensively mined, and that it is further protected by a large number, probably in the neighborhood of 100 submarines, which might be utilized for this purpose.

3. Egress via the Kattegat and Skagerrack is assured from German Baltic bases until such time as Norway, Denmark, and Norway, or Denmark, Norway, and Sweden decide to cooperate with the Allies.

4. To attempt to penetrate the Baltic with the allied fleet to attack the German bases in Kiel Bay is considered inadvisable while Denmark, Norway, and Sweden remain neutral.

5. The probable intention of the enemy is to continue operations from the above positions, utilizing the Skagerrack and North Sea exits via either the Dover Strait around Scotland, to reach the hunting grounds on trade routes in the Atlantic. If the Zeebrugge and the Helgoland vicinity were rendered untenable as bases for submarines, probably the Germans would take possession of the littoral of Holland and Denmark for such bases, and continue using the Skagerrack outlet from the Baltic seas.

6. *Our forces and courses open to us.*—The Allies have a great preponderance of surface force especially in the heavier types. Destroyer forces are about evenly balanced considering the dispersion of destroyer strength required to protect commerce; submarine preponderance is decidedly with the Germans.

We may attempt to—

1. Reduce the Helgoland region and close exits for submarines.
2. Reduce the Zeebrugge region and close exits for submarines.
3. Enter the Baltic and close exits for submarines from the Baltic bases.
4. Prevent Danish and Dutch territory being used for submarine bases.
5. Construct and maintain mine barriers about the Helgoland region.
6. Construct and maintain a mine barrier in the Skagerrack or Kattegat.
7. Construct and maintain mine barriers in the Zeebrugge region.
8. Construct and maintain a mine barrier across the North Sea.
9. Close Dover Strait to submarines by a mine barrier and surface patrol.
10. To prevent submarine operations, (a), (b), (c), and (d), all are necessary; or (d), (f), and (g), all are necessary; or (h) and (i) are necessary.

Of course, a combination is practicable of a mine barrier at one point, Zeebrugge for example, with a reduction of Helgoland fortifications and destruction of submarine bases in that region, or vice versa.

10. *As to (a).*—The proposition to reduce Helgoland and close exit for submarines has been under consideration by the British naval authorities for three years, and their experience leads them to the conclusion that, with the means now available, the attempt could not succeed. Failure is assumed to result from the following causes:

- (1) The British in their attacks against the Zeebrugge region have been able to make little or no impression upon the shore defenses. It is known that over 200 guns and mortars capable of inflicting damage on attacking ships are in place. Dangerous fire from some of these batteries against attacking vessels has been delivered at a range of about 36,000 yards. Monitors bombarding Zeebrugge, at a range of 26,000 yards, have been concealed by a smoke barrage to prevent their destruction. Fire control is most difficult because of German control of the air, and smoke barrages employed on shore. After a year's operations the base is still in use, and no injury that has not been speedily repaired has apparently been inflicted. It is entirely probable that the superior importance of Helgoland region has resulted in even a more complete and comprehensive defense. (2) There is nothing known as to the changes that may have been made in the Helgoland region defenses, and no guide as to the force necessary to overcome them and no way of estimating the chances of success. (3) The Germans control the air in the Helgoland region, and without air reconnaissance, it is not possible to locate their batteries or control the fire against them. (4) There is a 12-foot rise and fall of the tide, with swift currents which would seriously interfere with mining operations or the placing of the hulks it would be necessary to sink to close the ports. (5) It is estimated that the Germans have about a hundred submarines available for operating in Helgoland Bight, and there is no method of protecting ships operating in narrow waters where they would have to alternately anchor and then maneuver when firing on land defenses. (6) The vulnerability of ships at battle ranges of heavy guns and the difficulties of controlling fire against land batteries. (7) Operating so close to a German base, the difficulties of supply and communication and adequate protection against submarines and aircraft. (8) The certainty that even if Helgoland were taken, a greater problem would confront the naval forces in the necessary reduction of mainland batteries and the further certainty that submarines bottled up at the

North Sea end of the Kiel Canal could continue operations from Baltic bases through the Skagerrack.

11. Closing Helgoland Bight would undoubtedly weaken the morale of the German forces and might incline Germany to peace, but the military disadvantages for Germany are not of such an overwhelming character, as the Baltic exit for submarines and the base at Zeebrugge would be still available.

12. While the united Navies of the Allies are greatly superior to the Navy of Germany in heavy ships, the loss of even predreadnoughts would bring the contending sea forces nearer to an equality. In a heavy ship attack on the land fortifications of the Helgoland region, the Germans could withdraw their heavy ships into the Baltic if necessary.

13. *As to (b).*—The shallow coast prevents deep ships from getting close enough to the Belgian shore batteries successfully to bombard them. Operations with monitors have only resulted in temporary damage. Control of the air is with the Germans. To silence batteries and approach the shore closely enough to cover a landing of the fleet is judged to be impossible with the German army in occupation. If Zeebrugge is taken, it must be from the rear by the allied armies.

14. *As to (c).*—With Norway, Sweden, and Denmark neutral, to operate on the Baltic coast so close to the Kiel Canal presents insuperable obstacles, in view of its mine defenses, land defenses, submarines, and a concentration of the entire German power at the Baltic end of the canal. It appears that the German fleet, operating in its own waters, among its own mine fields and assisted by shore batteries and submarines, is stronger than any fleet the Allies could send into the Baltic.

15. *As to (d).*—In case the Helgoland region and Zeebrugge-Ostend region were controlled by the Allies, Denmark and Holland must be prevented from falling under German influence sufficiently to use their ports as German submarine bases.

16. If the reduction of the German submarine bases is considered impracticable, there remains the resort to mine barrier obstructions (e), (f), and (g), which contemplate efficient barrier constructions (1) from the Danish coast to the westward of Helgoland to German territory; (2) between neutral countries, Denmark and Norway, across the Skagerrack, or between Denmark and Sweden, across the Kattegat; (3) to the westward of Zeebrugge-Ostend, striking the Belgian coast to the northward and southward of these points.

17. *As to (e).*—British opinion after three years experience is that it is impracticable to maintain a mine barrier inclosing Helgoland and the mouths of the Elbe, Ems, and Weser, which would be effective against submarines, because (1) the proximity to the German bases and Kiel Canal outlet renders concentration against the patrol of mine fields so easy as to drive it off in places, and thus make practicable breaches in the barrier; (2) the distances from British bases make it very difficult to reenforce the patrol at any one point, in time to meet an attack; (3) it would be very difficult to maintain a strong enough force at the barrier to be everywhere equal to such attacks, because of the ease with which German heavy ships can reenforce the smaller surface craft, do their work and return to port; and therefore (4) to meet such attacks a force stronger than the German fleet must be constantly at the barrier; (5) this is considered inadvisable because of the certainty of attack by submarines; (6) the Germans control the air and the patrol would be constantly under fire from the air; (7) international complications sure to arise with Denmark over the effort to make the barrier off the Danish coast, within the 3-mile limit, effective; (8) the difficulty of maintaining a barrier off the Belgian coast, under fire of German guns.

18. *As to (f).*—A barrier across the Skagerrack or Kattegat has the following disadvantages: (1) Having both ends abutting on neutral territory; (2) the end of a barrier off the Danish coast would surely be brought under the fire of German guns erected on that coast; (3) the Skagerrack barrier, 60 miles long, would be exceedingly hard to protect against attacks delivered by submarines and surface craft through the Skagerrack and Kattegat from German Baltic bases; (4) the usefulness of the Skagerrack or Kattegat barrier, depends upon Helgoland region having been similarly inclosed, or the fortifications there reduced and exit to Kiel Canal closed.

19. *As to (g).*—The British after three years operations off the Belgian coast have been unable to construct and maintain an efficient barrier off Zeebrugge, in the face of the operations from nearby German bases of both submarines and surface craft. Both ends of the barrier must remain under the fire of German shore stations, or extend into Dutch waters. Effectively closing Zeebrugge may result in German occupation of the Scheldt River, or other parts of the Holland littoral, for submarine bases.

20. The closing of the North Sea by barriers laid from Scotland to Norway, and in the vicinity of Dover Strait, should not interfere with local attempts in any of the above discussed fields of endeavor to limit German submarine operations. But these two barriers, if effective, would, so far as egress from the North Sea is concerned,

the operations, either by attempts at occupation or by the laying of barriers at the Ligerak, Helgoland Bight, or Belgian coast, unnecessary.

21. *As to (h).*—The further advantages are: (1) One end of the barrier rests on England, close to British naval bases; (2) the entire barrier is much nearer to British fleet bases than to any German submarine or surface craft base; (3) the discouragement of the Germans that will follow if the rate of tonnage destroyed decreases more rapidly than the allied merchant tonnage construction increases; (4) the corresponding encouragement to our allies.

22. The difficulties in the way of laying and maintaining an efficient barrier across the North Sea are such that the British have, until recently, considered them insurmountable. With the use of the American mine, and with full American cooperation, the barrier promises sufficient success to warrant undertaking it. The disadvantages are: (1) The difficulty of supplying the material on the spot and laying the barrier;

(2) the constant danger of interruption by the enemy while in progress of construction and concentration of German effort upon the barrier when completed; (3) supplying the patrol craft necessary to protect the construction while in progress and patrol the barrier afterwards. If the barrier is pushed out in successive sections from the British coast, a small patrol will be required at first, then constantly increasing in numbers as the work progresses.

23. *As to (i).*—The necessity to close the Dover Strait is imperative. Whatever other measures to control submarines are employed, it is self-evident that no single measure would do as much to prevent merchant-ship destruction as to deny a passage for submarines to the Atlantic by this route. Closing this strait would compel the smaller submarines to pass around Scotland to the Atlantic, thus very materially reducing their season of active operations against commerce. In the heavy weather to be encountered on this route in the winter months probably none but large submarines would attempt to operate in the Atlantic.

24. *Conclusions.*—From the above considerations the General Board is decidedly of the opinion that of the measures discussed from (a) to (i), inclusive, the scheme included under (h) and (i) offers the best chances of success—that is, to close the North Sea by the Aberdeen-Egersund barrier approved by the British Admiralty, and to similarly close the Dover Strait.

25. The General Board does not underestimate the practical difficulties that must be overcome in providing the necessary material and transporting, placing, and maintaining it in the face of the determined efforts of the Germans to render the barrier abortive. Further, the barrier even when placed can not be effective without an adequate patrol. The General Board is, however, encouraged to give its endorsement to this plan because it has the approval of the British Admiralty; it is proposed by it as the best practicable plan to meet present war conditions; the Chief of Bureau of Ordnance stated the material, mines, anchors, moorings, etc., can be surely supplied; and the accompanying memorandum of Capt. R. R. Belknap, United States Navy, who has been actively engaged in conducting mining operations, points the way to handling the details of transporting and planting.

26. It is assumed that the British Admiralty, in approving this plan, recognizes the vital importance of the necessary patrol—that it is clearly seen by it where the required number of vessels is to be obtained, and that the extent of the cooperation required of the United States in this regard will be communicated to the United States Navy Department.

27. If it is decided to proceed with the construction of the Aberdeen-Egersund barrier, the General Board recommends that the preliminaries be arranged at once, and that suitable officers of experience in mining operations be sent to England to arrange for our participation in the work.

W. S. BENSON.

Approved:

JOSEPHUS DANIELS.

NOTE.—Memorandum from Capt. R. R. Belknap, United States Navy, to the General Board, dated October 23, 1917, was inclosed with the above letter.

[Inclosure B, accompanying general board letter No. 425-5 (serial 778), Oct. 24, 1917.]

OCTOBER 20, 1917.

From: Senior member present.

To: Secretary of the Navy.

Subject: Inquiry re mine barrier across North Sea.

The general board recommends that the following inquiry be cabled and that an early answer be requested:

"The department requests to be informed whether the plan for the placing of a mine barrier across the North Sea on the Aberdeen side has the approval

of the Admiralty. It is believed that the great experience of the British naval forces in North Sea operations and their experience in naval mining during the present war puts them in the best position to decide whether the proposed scheme is practicable in construction and maintenance and whether in the opinion of the Admiralty it is the best scheme in sight for limiting the operations of enemy submarines, provided that the Straits of Dover can be efficiently closed to the passage of submarines, which if possible, in the opinion of the department should be done at the earliest possible date."

CHAS. J. BADGER.

[Inclosure C, accompanying general board letter No. 425-5 (serial 778), Oct. 24, 1917.]

From: Commodore Gaunt, Royal Navy, British Embassy, Washington, D. C.
To: Admiral Benson, United States Navy, Director of Naval Operations.
Date: October 23, 1917.

The following cable has been received from Chief of Staff for the Chief of Naval Operations (paraphrased):

"With reference to your cable No. 780 to Admiral Sims. The mine barrier has been approved by Admiralty and now confirms approval. The preparations are rapidly proceeding.

"My 513 (cable dispatched on 17th and received 18th October) indicates the assistance desired from the United States of America. This scheme is considered by the Admiralty to be best to be carried out at a distance from the bases of the enemy. The Admiralty are working on a supplemental scheme for operation close inshore, but any such inshore operation has the defect that a passage through for submarines can eventually be cleared by the enemy. Therefore North Sea passing northward also necessary.

"No scheme yet tried has been effective in closing the Dover Straits to submarines, but measures are being constantly improved, and they are at the last always a considerable deterrent. Mining operations on an extensive scale against submarines in the Straits of Dover commence in November. Owing to the lack of effective antisubmarine mine this has hitherto been delayed."

C. LANCELOT-GAUNT,
Lieutenant Commander, R. N. V. R.

[Inclosure D accompanying General Board letter No. 425-5 (Serial 778), Oct. 24, 1917.]

Paraphrase.]

OCTOBER 10, 1917.

From: Chief of naval staff.
To: Chief of Naval Operations.

It will be necessary to increase the number of lines of United States mines in each system in the North Sea barrage from two to three if there should be any difficulty in using the lower antennae of United States mines for first supplies. Could you please state an approximate date when supply of complete mines and sinkers will begin, stating at what rate the supply will be maintained?

As all British mine layers will be fully engaged in laying British portions of the barrage, will you please say how many United States mine layers will be available to naval transport officer, Brest, and the output of United States mines. It is estimated that each ship could make five mine-laying trips a month. As a base for United States mines and mine layers, it is proposed to use Cromarty. The question of facilities for assembling ready for use, storage, and embarkation is being investigated on the spot. It is suggested that it is desirable that United States officers should confer with ours on this question and examine proposed arrangements as to suitability for dealing with United States mines and sinkers; also to ascertain as to whether our depot system will be suitable for application to United States mines. It is proposed that the necessary assembling and testing of United States mines and sinkers on receipt and before issue to mine layers should be dealt with by depot staffs provided by you if possible. It is hoped that you will be able to agree with this. United States officers if sent over can report numbers required.

I should be much obliged if you would inform me as soon as possible whether you can supply sinkers for United States mines.

[Inclosure E accompanying General Board letter No. 425-5 (Serial 778), October 24, 1917.]

OCTOBER 22, 1917.

From Senior member present;

Secretary of the Navy.

Subject: Plans for limiting the activities of enemy's submarines in Atlantic trade routes by mine barrages established at the entrances to the North Sea area.

The General Board in its consideration of plans to prevent or at least substantially limit entrance and exit of enemy submarines to and from the North Sea area, including the Baltic, has not yet reached a final conclusion but it has proceeded far enough in its investigation to convince it that the effective closing of the Straits of Dover against enemy submarines is an essential feature of any plan that may be adopted involving the establishment of mine barrages.

2. The General Board, therefore, urges that operations for the closing of the Straits of Dover entrance to the North Sea be commenced at once.

3. The General Board is of the opinion that the closing of the Straits will render it much more difficult for the enemy submarines to reach the Atlantic trade routes or the English Channel itself and will materially reduce the number of enemy submarines working in those areas because of the longer and more difficult routes they would be compelled to take around the north of Scotland to their present cruising grounds in the Atlantic or the English Channel.

4. As to the assistance which this Government can render the General Board is informed by the Chief of the Bureau of Ordnance that 5,000 Mark VI mines complete can be ready for shipment to England by December 15 next and 20,000 more by January 15.

5. The personnel and the number of mine planters and other craft desired by the Admiralty to assist in the operations would have to be subject to further arrangement between our Navy Department and the Admiralty. The General Board recommends that if this or other cooperative mining plan be decided upon, the personnel to arrange for the details be sent to England as soon as practicable.

6. The General Board believes that the experience of the British Navy in mining, gained through three years of war and its familiarity with local conditions and resources best fits it to make the decision as to the location of the barrage but the General Board suggests the consideration of a barrage from the vicinity of Harwich to the vicinity of Dunkerque. This line though longer than the one across the Straits of Dover seems to possess certain advantages over the shorter route—the holding ground is better, the tidal currents less swift, advantage could be taken of banks and shoals along the route, and London and other Thames ports would be left open to the sea as at present. The patrol of this route does not appear to offer greater difficulties than does the present patrol of this region.

7. The General Board recommends that the British Government be informed of the substance of this letter by cable.

CHAS. J. BADGER.

APPENDIX D.

MINE CARRIERS.

The 24 vessels named below were utilized by the Navy Department for transporting mines to the advanced bases in Scotland. Twenty-three of these were taken over for exclusive use as mine carriers. The *Mercurius* was not so taken over, but the shortage of ships made it necessary to use her for one trip.

Lake Side, Manta, Lake Worth, Ozama, Choctaw, Lake Ontario, Lake Bridge, Lake Port, Kiowa, Lake Superior, Lake Wood, Lake Champlain, Lake Forest, Lake Erie, Lake Michigan, Lake View, Lake Shore, Sioux, Lake Placid, Mercurius, Lake Huron, Lake Tahoe, Carib, and Lake Moor.

Capt. PRATT. There has been a point brought up in Admiral Sims's testimony about our attempting to establish routing officers, and the idea was conveyed that these routing officers were intended to displace or disrupt the existing organization and plan, which was a British organization and a British plan, and thereby cause a certain amount of confusion, which is necessarily so in case you start to overturn a plan which is running passably well during the war.

The CHAIRMAN. That is, in connection with convoy?

Capt. PRATT. That is in connection with convoy. That was not our idea. I know about it: I had to father the plan. I had the details in my mind constantly. I wrote the cables that went across. The idea was this, that we were very glad, and later when the submarine came on our coast did accept in toto the general principle under which the British were working. We reserved to ourselves merely a right to say how these vessels should enter our own ports, and when and where; but the officer who gave us the above assistance in fact was the British routing officer sent from the other side.

The CHAIRMAN. Then, this plan had nothing to do with vessels going from our ports to the other side?

Capt. PRATT. No; they were handled entirely by the people on the other side. It would have been a great mistake, and we never interrupted to interfere with the plans or with how the vessels should be received on the other side. The establishment of routing even on this side was merely with the idea that later on, when we had become so thoroughly cognizant of their plans and so proficient in operating under the general joint scheme, we could relieve some of their officers for work abroad or in any place where they chose to put them, and thus take over and operate the offices which they had established in our own ports by our own people. And further, there was this idea: These offices were being established in South America, and it was a little point of pride with us that the South American countries, particularly Brazil, should be handled by our own people as soon as we knew enough about it.

The CHAIRMAN. There has been a second call for a quorum of the Senate, and I think we will adjourn now until to-morrow morning at 10 o'clock, Captain. You have finished that point?

Capt. PRATT. I have finished that point. There is no need of discussing it.

The CHAIRMAN. Did you have a paper upon that?

Capt. PRATT. No; I was just talking about it.

(Thereupon, at 12.27 o'clock p. m., the subcommittee adjourned until to-morrow, Wednesday, April 21, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

WEDNESDAY, APRIL 21, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met pursuant to adjournment in room 235, Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Capt. Pratt, will you continue?

TESTIMONY OF CAPT. W. V. PRATT—Resumed.

Capt. PRATT. Before starting in, I would like to correct, if I may have given an impression yesterday in my statement in regard to convoy, I would like to make a further addition to what I said in order that I might clear up any doubts that may exist in the minds of you gentlemen in regard to convoy. I said that although the principle of convoy was established early in 1917, and we approved of it in July, 1917, convoy did not take effect for westbound ships crossing the Atlantic at all during the war, although it was discussed before the armistice came on, and we were endeavoring to meet the demands. There is a difference between convoy and escort. I know that our troopships on their return voyage from France were escorted by destroyers and the patrol vessels outside of the immediate submarine zone, although that did not protect them from the cruising submarine that operated as far west as the Azores, down to the Canaries, off the Cape de Verdes, and later as far west as the United States. They were armed, with guards, and I think as far as it was possible to give them protection, the British merchant ships and our own merchant ships from Great Britain were escorted westward beyond the immediate submarine zone as far as it was possible to give them escort. The details of that I do not know, but that would be, in general, what they would strive to do. I do know, however, that the protection which could be given to westbound shipping was not as great as that which was given to eastbound shipping. It was not, in the nature of things, possible to do it.

The CHAIRMAN. They never came home in convoy?

Capt. PRATT. No; they did not. They split anyhow; if they did not split from their ports they split immediately after they came outside of the close-in submarine zone. And that helped. It was desirable to do it. It speeded up the flow, and that was recognized probably on the other side of the water far more than by us.

The CHAIRMAN. They split where the eastbound convoys would assemble, did they not?

Capt. PRATT. No; the eastbound convoys assembled in our own ports; but the ships returning to us always came in singly, having split at sea, or sailing from their own ports.

The CHAIRMAN. You were also to give us, I believe, the names of the ships which were sunk.

Capt. PRATT. Oh, yes. As I said, I have had them looked up, and they have given me the names as the *Campania* and the *Moravia*. There was also a ship the name of which was not submitted yesterday, the *Vacuum*, which was sunk in April, when some people lost their lives.

The CHAIRMAN. There were others, also that were sunk?

Capt. PRATT. Oh, yes; a great number of them. I just happened to mention those two.

Now, I come to the discussion, in what is called operating plans, of the Azores situation. I am making this explanation in no criticism at all, of the point of view which has been expressed on the other side, but rather to give you an expression also of our own point of view.

The CHAIRMAN. What do you mean by "the other side"?

Capt. PRATT. Well, Admiral Sims's point of view. When I speak of the other side of the water, I speak of our people that were over there—Admiral Sims and his staff. There were two distinct points of view about the Azores.

The CHAIRMAN. Then you consider Admiral Sims the other side as far as you are concerned?

Capt. PRATT. Oh, no; not at all. I am speaking geographically. I was speaking of the other side of the water. I hope I am great friends with Admiral Sims, and always will be. There is no criticism one way or the other. I am trying to analyze it, and give you the Atlantic side, and he had, of course, the European point of view, and the only question is to adjust the two. We had from the very beginning made a study, and looked with a great deal of—it is difficult to get the right word. We appreciated, let us say, the position of the Azores for two distinct reasons. One was, for the small craft we were endeavoring to send across, even our 750-ton destroyers, there was the necessity of providing a place in mid-ocean from which these craft could refuel, and from there start farther east to the British and French waters. If Portugal had not been in this war, it would have been for us a tremendously difficult problem to have gotten any of the yachts, any of the subchasers, any of the tugs, and a large percentage of our destroyers across, for the simple reason that they did not have the steaming radius to cover the 3,000 miles of ocean lying between us and the British shores. For that reason it very early became a necessity for us to consider very definitely the value of a stopping place in mid-ocean. For that reason the Azores always possessed for us a very high strategic value.

Their practical importance was nil, except that it might offer a possible basing place for German submarines; and if, perchance, they were to gain possession of that spot, it would prevent us from using it and utilizing it to its full capacity, as we did later. I may say that had it not been for the Azores either on our eastward-bound expeditions in sending our small craft across, or westbound, when the armistice

tice was completed and we were sending them home, it would have been a very difficult problem for us to have accomplished at all.

Naturally, the point of view of the forces operating in London was centered more in the efforts around the British Isles, and rightly so; while we, being farther removed, could not but be impressed, and perhaps overimpressed, by the value of this stopping place in the Atlantic.

Moreover, we knew that shortly our troop movement was going to start across, and we knew that if the German submarines for one instant could base upon the Azores, they would flank our troop-transporting movement at its vital point, the point where it crossed the thirtieth meridian, being nearly there, and the point where it passed from the control on the Atlantic side to the British side of the water, and we were afraid of it, and for that reason we always sent forces there; and while they may have been more numerous at times than it was tactically right to keep there (that I will not say) its importance never left our minds, and for that reason we did have forces there rather more than for their usefulness in hunting the submarine.

The forces we had there practically amounted to the following. I am giving it in very general terms. A German submarine appeared off Punta del Gada and bombarded the place before we ever got there with any real fighting forces. We happened to have a collier in there with a gun on board. It was the *Orion*. I think we were landing coal, anticipating our future movements. She held the submarine off.

From that time on, a little later we commenced sending our forces there. Every subchaser convoy that went across had to go via the Azores. Our submarines that went over went via the Azores. Our tugs went that way and several destroyers. Some of the older ones of only 2,000 miles' radius had to either stop at the Azores or, as we in the very beginning had to do, to be fueled at sea. We had to establish a mobile oil base at sea, using some of our oilers, moving them about in the ocean very secretly, at which points our destroyers had to oil before they could go across, and we had to change the position of these oilers constantly for fear the Germans might get wind of their position and attack them.

The CHAIRMAN. Were the 2,000-mile radius destroyers coal or oil burning?

Capt. PRATT. Some oil and some coal. One, for instance, would be the *Henley*. I know she is not a good boat. The *Mayrant* would be another one. I am not qualified to speak of them, ship for ship, but it is the older type of our 750-ton boats.

The CHAIRMAN. They are mainly coal burning, are they not?

Capt. PRATT. No, sir; there are only five 750-ton coal burners. There are quite a number of oil burners of 750 tons. I think that is about all that I want to speak of in regard to the Azores situation. I just wanted to say that, so as to clear up our point of view. It is a matter of adjustment more than anything else, I think.

Now, there is one other problem that has been mentioned in the course of Admiral Sims's testimony which, in the same way, I would like to clear up so that you gentlemen may get the point of view of operations on this side, and I would like to say, before going into the details of it, that I can not give too much praise to the planning section in London that Admiral Sims organized, after he got his men there.

Without their assistance we could not have done the work we did over on this side and I personally depended upon it, and upon Captains Schofield and Yarnell and others who were working in conjunction with the British Admiralty for them to send—and they did—just as complete plans as it was possible for any people to get out. Their cooperation was magnificent, and we tried to give them the same.

The battle cruiser raid plan did not in its inception start entirely with the first plan that Admiral Sims speaks of, of May 17, 1918. The idea that we all had all through 1917, and after the first German land drive in 1918, in March, was this: The main effort we shall have to protect our troops against will be a raiding effort, and they will use that type of light, fast ship which will serve best the purpose of raiding our troop convoys, and which also can be spared from the main fleet; because up to the time the Germans projected their land drive in March, 1918, I think we almost all of us felt that the land drive would come simultaneously with a fleet action, in this, that the Germans would make a united effort, not a disintegrated effort—one of sea and land—and that the submarine campaign was, in a way, a preparation for a united effort of great force. Therefore it would not have paid them, looking at the thing broadly, to have projected types into the ocean such as their battle cruisers, which would serve them a better purpose in the united sea drive of their total fleet.

So that Admiral Sims, I think, very wisely advocated, along with convoy operations, that we should send our older type battleships to go along with them. There was a difference of opinion there. Admiral Sims wanted the old battleships. Admiral Benson stuck to the idea that they should be held back as a reserve, and thought that sufficient protection would be given the troop convoys by sending the armored cruisers with them. The result was that the armored cruisers went, the old battleships did not, and we did not put the old battleships in until August of 1918. Whatever may be the theories regarding and the differences of opinion, the fact remains that Admiral Benson guessed right. They were not needed.

So we went on very much on the same line that we had been going until after the first land drive in March, 1918. That was a very critical time. But when that first wave was stopped on land, it began to be evident that the land wave, very much like the submarine wave of 1917 which culminated in April of 1917, was beginning to, or would very possibly, recede. In other words, exactly as they did in the first battle of the Marne, their first stroke was their great stroke, and it never went beyond that apex.

The same thing happened in April, 1917; the same thing happened in March of 1918; and that put a different complexion upon the problem which we had to study. That problem then became less one of two great fleet actions, and more the absolute necessity of Germany's stopping the land movement from our country across to France, and had she been wise I think, in my judgment, she would have used every effort of hers, even to sending her battleships out, to break that line; so that we began at once to feel that there must be a change of strategy necessary.

The London planning section had been thinking about that, too, and we had from them on May 17—which I will submit—a very excellent first plan, a basic plan. I will read you the decisions of that plan. It is not necessary to go into the details now, but you

will see, gentlemen, from the explanation that I made to you yesterday of the difference between a basic plan upon which you can generally prepare or get ready and make an initial move, that there is a difference between that and a definite operating plan, and as I think I have said before, we here in Washington were, by definite agreement with the Admiralty in London, responsible for the sea west of longitude 30, straight through north and south, and the British looked out for everything east of longitude 30. Therefore, it was a situation which we had to face over here, as well as Admiral Sims in London, because, regardless of whether or not a troopship had been sunk east or west of longitude 30, the first demand would have been made upon the office in Washington to explain to the people, and we would have had to have called upon Admiral Sims for the explanation in case it occurred in the waters over which the British had jurisdiction. Therefore, it became of vital necessity to see that we had a definite operating plan, which we felt would cope with the situation we might be called upon to cope with.

The CHAIRMAN. About where does longitude 30 run?

Capt. PRATT. It runs very close to the Azores. The Azores are just east of longitude 30. It is almost along that line.

Our idea of a plan of some sort was to divide the ocean practically into three parts. The area east of longitude 20 was well within the covering power of the vessels based in British waters. The area west of longitude 45 was well within the covering spots—that is, points toward which ships could retreat in case of an enemy in mid-ocean. But the area which lay between longitude 20 and longitude 45 was the disputed area, and a very dangerous area it was. I have figured out, during the days of our greatest troop movements, the number of troops that daily were crossing that doubtful area—a sort of no man's land. That number averaged 100,000 a day, almost daily; 100,000 of our men crossing that disputed area; and it was a dangerous area, too.

This was the original base plan furnished to us by the London planning office. The date of this plan is May 17, 1918. I will submit the entire plan:

[Memorandum No. 93.]

PLANNING SECTION—PROBLEM No. 13.

Subject: Battle cruiser raid.

General situation: As at present.

Required: An estimate of the threat of a raid by a German battle cruiser in the Atlantic.

Our constant naval mission in the prosecution of this war is, so far as it is related to raiders:

- 1) To destroy the raider.
- 2) To maintain sea communications.

ENEMY FORCES, THEIR STRENGTH, DISPOSITION AND PROBABLE INTENTIONS.

Enemy strength in this problem is assumed to consist of one battle cruiser—latest type—plus submarines.

The mission of the battle cruiser would be "to destroy maximum amount of shipping possible with special reference to troop convoys, and to return to a home port."

NOTE.—The accelerated rate of delivery of American troops in France will soon have a very important bearing on the military situation in France; this fact can not but be known to the enemy and may therefore cause him to take extraordinary measures to interrupt the supply of men from America.

The problem of the battle cruiser assigned to operate against shipping in the Atlantic naturally divides itself into three phases:

- 1. The escape from the North Sea.
- 2. The operations.
- 3. Return to a home port.

The battle cruiser in deciding upon the route by which to gain the Atlantic will consider the Dover Straits and the route north about.

Enemy knowledge of the barrage of the Dover Straits, the numerous mine fields in the narrow seas, the destroyers at Dover, Harwich, and in the Channel ports, of the monitors and other fighting vessels at Dover and in the Channel ports, will all serve to deter the battle cruiser from using the Dover Straits. In addition, his knowledge that all incoming transports and convoys are escorted by destroyers—that in the Channel there are numerous ports to which shipping can escape—that convoys outside the Channel would have about 24 hours' notice of his approach, that destroyers in the Channel could trail him, rendering secrecy of his movements impossible; that he would have to use high speed and thereby reduce his cruising radius; that it would be impossible for him to take fuel ships with him; that the probability of complete failure of the effort through loss in the Channel is great—are all arguments against the use of the Dover Straits route.

The north-about route has the advantages of:

- (a) Secrecy.
- (b) Moderate cruising speed until operating area is reached.
- (c) Possibility of taking one or more fuel ships along.
- (d) Possibility of using submarines as a scouting screen for the battle cruiser.
- (e) Small risk of loss when outward bound.

For these reasons the battle cruiser will undoubtedly choose the north-about route.

The fuel requirements for the two routes to an operating ground in the vicinity of the west coast of Ireland are not materially different.

In deciding upon the operations, the enemy will undoubtedly consider that the hazard to the battle cruiser is great and that in order to justify the hazard he must make certain that the results will be at least commensurate with the hazard involved. The operations possible are very closely dependent on the available fuel and consequent cruising radius of the battle cruiser—

Cruising radius at 10 knots, about 8,800 miles.

Cruising radius at 15 knots, about 6,000 miles.

Cruising radius at 24 knots, about 3,600 miles.

In planning fuel expenditure preceding the operation the enemy would probably formulate a table somewhat like the following:

| | | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|-------|
| Percentage of fuel supply necessary to reach a point midway between Faero Islands and Iceland outward bound on basis of two-fifths power... | per cent... | 16 |
| Percentage of fuel supply necessary as a reserve when returning by same route on basis of maximum speed..... | per cent... | 23 |
| Percentage of fuel available for operations south of Iceland, Faero Island line..... | per cent... | 4 |
| All cruising speed of 15 knots and radius for full speed on short notice at a 15 per cent extra expenditure of fuel. Then available cruising south of Iceland, Faero line is..... | miles... | 3,130 |
| If, however, provision is made for one day's steaming at 24 knots, the above cruising radius is reduced to about..... | miles... | 2,800 |
| Nearest point to a probable convoy route—north-about to Irish Sea, from Iceland, Faero line is about..... | miles... | 1,400 |
| The nearest point to a probable south-about route to Irish Sea is about... | miles... | 900 |
| The distance to Cape Finisterre via direct route is about..... | miles... | 1,200 |

From the above it appears that under the most favorable circumstances for the battle cruiser, she might steam at 15 knots, a total of 1,600 miles in an area where convoys might be encountered. This is equivalent to a total of four days' operations in the Atlantic, south of Lat. 55° N.

In considering the foregoing tabular statement he would undoubtedly conclude that it was necessary to take fuel ships with him.

In making his exit from the North Sea he will probably be preceded by cruisers and submarines acting as scouts to ensure the secrecy of his movements and may have in addition submarines posted in the general vicinity of our bases to observe movements that may indicate a knowledge on our part of his intentions.

Having made a safe exit the battle cruiser will probably re-fuel previous to beginning his operations, and will station his fuel ships at one or more points well clear of all traffic.

THE OPERATIONS.

In order to make the battle cruiser fully effective in the execution of its missions, the enemy will undoubtedly arrange for scouting by the numerous submarines he is able to send to sea; these submarines in order to be free to operate and to get contract with convoys beyond the region of destroyer escort would be stationed somewhere in the vicinity of the 20th meridian W. Other submarines stationed near ports from which convoys issue might be directed to trail them on their westbound course to sea and to keep the battle cruiser informed of progress.

Similarly eastbound convoys which may cross the scouting line of submarines would probably be trailed by submarines who would keep the battle cruiser informed of progress.

The battle cruiser would endeavor to make its first attack an overwhelming one, because thereafter it would expect a lively pursuit which would interfere with its operations.

As a successful attack in any area will unavoidably drive shipping from that area the battle cruiser will foresee this effect and plan to shift its operations to a second area, either farther west or to the Gibraltar route, submarines being stationed in that area also to give information.

The battle cruiser will expect the return of many merchant ships to port and in order to make full use of the possible panic his operations may cause, will station submarines in the vicinity of those ports nearest to the attack in order that they may operate against returning vessels.

After the first attack by the battle cruiser it is possible that it may withdraw to again refuel and in order for its scouting submarines to take up new positions.

THE RETURN.

The longer the operations last the greater the tendency toward dispersal of allied fighting forces. When the operations of the battle cruiser are finally concluded the greatest chance of success in returning to a home port would be for it to delay several days in a region remote from sea traffic before making the attempt.

SUMMARY AS TO THE BATTLE CRUISER.

- (1) Would use the north-about route.
- (2) It will take one or more fuel ships, fitted for refueling at sea.
- (3) Will operate against convoys outside of the zone of destroyer escorts.
- (4) It will use submarines as scouts to assist it in gaining contact with convoys.
- (5) It may remain at sea for many days, shifting its area of operations to suit conditions.
- (6) It may delay its return to port in order to increase its chances of success.
- (7) Increased submarine activity may be expected near ports nearest to the first attack by the battle cruiser.

OUR OWN FORCES, THEIR STRENGTH, DISPOSITION AND COURSES OF ACTION OPEN TO US.

No ocean escorts are now strong enough to oppose effectively an enemy battle cruiser. If we assume, as we have, that the battle cruiser can remain at sea for an indefinite period, fixed detours to avoid danger will not be effective, as the battle cruiser may estimate that just such detours will be made.

As to measure against the battle cruiser, two steps are necessary:

1. To get contact with one or more vessels, having speed equal to the speed of the battle cruiser.
2. To bring at least two battle cruisers against it.

The accomplishment of (1) should enable continuous warnings to be sent out and should further enable our own battle cruisers to bring the enemy to action.

Destroyers are suitable for (1) and will probably be nearest to the battle cruiser when it is first heard of.

In order to make use of them it will be necessary to reduce temporarily the number used in escort work. Available destroyers should proceed in scouting formation at moderate speed toward incoming convoys and adjust their movements to reported positions of the battle cruiser. If contact is gained the sole missions of the destroyer should be—

1. To keep touch with the battle cruiser.
2. To send out warnings.
3. To report positions.

Destroyers should exhaust their fuel and then drift rather than lose a contact gained. Fuel ships and tugs can be sent in relief of them.

Destroyers, if unsupported, can not destroy a battle cruiser, except under fortuitous conditions, so it is necessary to back up their scouting effort by battle cruisers to insure success of the operation. There are 10 battle cruisers available, but superiorities over enemy battle cruisers are needed with the Grand Fleet, three battle cruisers should be assigned to proceed toward the last reported position of the enemy battle cruiser. Since the cruising radius of our battle cruisers is small, fuel ships should be sent to sea rendezvous for their use if required.

As to protection of convoys, there are three principal methods of protection:

1. Evasion by predetermined plan.
2. Evasion in response to warnings.
3. Local protection.

Evasion by predetermined plan may be successful if battle cruiser can not reach and consequently is limited in its operations to four or five days in the area between latitude 55° N. and 43° N. In this case convoys might be sent to the southward of a circle 1,200 miles distant from the Faero-Iceland line. Eastbound convoys within this circle would in general shape their course for destination if east of battle cruiser making local detours as circumstances warranted. Westbound convoys that were east of battle cruiser position return to port—other convoys proceed, keeping station to reported position of battle cruiser until outside of 1,200-mile circle—Gibraltar convoys to continue if north of 45° N. and to take refuge as necessary if south of 45° N.

Evasion by predetermined plan is not so apt to succeed as evasion by a system of reliable warnings, leaving the route to be determined by the senior officer with each convoy. In addition evasion to the extent of new destinations will congest shipping and cause great loss of time.

Evasion in response to warnings is applicable to all situations and is now in practice. It requires—

- (a) Long distance radio equipment.
- (b) Good operators.
- (c) Continuous radio watch.

Two general principles should govern—

- (1) Convoys to proceed to destination whenever reasonable safety is assured.
- (2) If obliged to run, run directly away from last reported position of battle cruiser until a safe offing is made, then proceed according to circumstances, and if possible toward destination.

Local protection.—The only efficient local protection to convoys against battle cruisers is superior gun power in a battle cruiser or a battleship. No battle cruisers are available as escorts. The only battleships that are available are United States battleships. A modern battleship is a sufficient escort to a convoy, as the battle cruiser would have to accept battle in order to attack the convoy unless convoy dispersed, which of course it should not do. One predreadnought can be outranged by a battle cruiser, and therefore is not so good a reply, but two predreadnoughts are considered adequate to discourage an attack on a convoy by one battle cruiser.

An examination of this problem indicates the desirability, in fact, the very great desirability, of having additional battle cruisers conveniently situated for intercepting any enemy battle cruiser effort on our lines of communication with America.

This point is so important that it is recommended that an effort be made to have the battle cruiser division of Japan transferred to European waters.

NOTE.—The situation at the Dardanelles is another situation of the same general type as the one now under discussion, and one which could best be met by two or three battle cruisers supported by destroyers.

DECISIONS.

1. To scout for the battle cruisers by destroyers and other light vessels having sufficient speed that may be available.
2. To instruct the scouting vessels to trail the battle cruiser.
3. To support the scouting effort with two or three of our own battle cruisers, in order to destroy the enemy.
4. To send fuel ships to sea rendezvous for the use of our battle cruisers and scouting force.
5. To adopt the principle of evasion by convoys in response to warnings, rather than the principle of evasion by predetermined plan.
6. To protect important convoys by battleships of the United States fleet during the time when battle cruisers are out—or believed to be out.

In regard to these decisions I would say in regard to the second, "To instruct the scouting vessels to trail the battle cruiser," of course, the battle cruiser was the real danger. It was a faster type of ship than anything we had and a very powerful type of ship, second only in power to our own dreadnoughts.

In regard to the third decision, "To support the scouting effort with two or three of our own battle cruisers in order to destroy the enemy," when he says "our own battle cruisers," that means in this case with joint convoys. It is the joint plan of our people in London working with the people of the Admiralty, so that "our own battle cruisers" means British battle cruisers, because we did not have any battle cruisers.

Now, you must realize that at this time we were not escorting any of our troop convoys by battleships—not by old battleships—and had we been escorting troop convoys by our old battleships, I think I shall have to disagree with the testimony of some one officer—I have forgotten who it was—who thought that they could beat off battle cruisers with one of our old battleships. I do not think they could. That is merely opinion, but I do not think that the old battleships were equal to the new battle cruisers of the Germans. For that reason it became very essential that we should hold at positions where they could most adequately strike in case of necessity our dreadnought types, being the only ships which could cope at all with the German battle cruisers. A point of difference was this: The London office rather wanted us to make an immediate disposition of force.

That, from a military point of view, I believed to be wrong. If you have in the army a line at the front and one flank is to be threatened, you send to that flank a covering force. You send it there as a reserve to use when the other man has taken the initiative and you know what you are up against. But if you deploy that force before he has made his deployment, he has the jump on you, and you do not have it on him. So that that is why we wanted to send our dreadnoughts to the best place in Europe, one division, and move another division up to the most available place in the United States, which was Halifax, to hold them contained until we got information of the jump by the Germans, and then we would not have to throw out one or two, but we could throw out that body united, and the German never knew what we were going to do until he made a move himself. That is the reason we held the dreadnoughts together, so as to be able to throw them out to the flanks; and in that cablegram to Admiral Sims that was really the determining idea, to draw our force to the two places where we believed we could use them in the method which we believed to be the most approved of in the Army.

Now, personally, I always felt that this decision, which was rendered by the London planning section and contemplated the return of the German battle cruiser, had one fault in it. In the past we knew of one case where a German submarine interned in Spain had violated the neutrality of that country and gone to sea. A German battle cruiser had, with her coaling capacity, just about four days' active work in that disputed area, between 45 west and 20 west, in which she could work havoc; and then if she did not want to go back, she could come down and intern in Spain, and possibly be ready for another move.

The CHAIRMAN. Will you explain the statement you made that 100,000 men crossed the line each day between 20 and 45 degrees of longitude? That would make something over 3,000,000 men in a month.

Capt. PRATT. No. Well, there were at that time 10,000 to 15,000 men, and sometimes even as many as 20,000 in a convoy, and I think the maximum number of ships in a convoy carrying troops, that I can remember, was somewhere between 30 and 40. Now, it takes a long time to go across. We used to work it out each day, and we kept in the office an absolute track of every troop convoy and every cargo that crossed, and at 8 o'clock each morning the positions of those vessels were corrected up to date. They sailed according to sealed orders, all of those United States convoys which were personally directed, and their speed was such that we could plot from day to day exactly the position of each one of them. Now, when I said 100,000, I should qualify that by saying at any one day during the months when we were sending the maximum number across.

The CHAIRMAN. Then you mean on specific days only?

Capt. PRATT. Oh, absolutely, on specific days.

The CHAIRMAN. I just wanted to get that straight.

Capt. PRATT. Not when we were sending only 25,000. It would have been only maximum months. I remember one day I plotted seven convoys in that zone during that congested month. Now, at an average of 15,000 men to each convoy, which is a fair average, because they run from 10,000 to 20,000, I gave it as a fairly low figure that during that time there might be 100,000 men in that zone.

The CHAIRMAN. And that might happen two or three times during the month?

Capt. PRATT. Oh, yes. It did not happen——

Senator PITTMAN. How long did it take them to cross that zone?

Capt. PRATT. The average speed would be about 12 knots. The distance between 20 west and 45 west would be about 1,500 miles, and I think probably 5 to 7 days they would be in that zone, depending upon the speed of that convoy.

Senator PITTMAN. Then that would be 5 to 7 days they were in that area, and during any one month others would be following them up?

Capt. PRATT. Yes.

Senator PITTMAN. That is not like crossing it in one day.

Capt. PRATT. No, sir.

Senator PITTMAN. You would count each one of those five to seven days that they were in there?

Capt. PRATT. Oh, yes; I thought that was perfectly clear. The lowest speed of a convoy that troops were ever sent in—and that was a concession that was made during the critical months of the spring of 1918—was 10 knots. Our standard which we tried to live up to was nothing less than 15 knots, because speed is one of the most important factors in meeting the submarine menace. Remember, I am not giving you this explanation in any spirit of criticism at all of the attitude that Admiral Sims has taken, because we did not think there was any criticism; just a matter of adjustment, that is all, and I wanted to explain, because the question had not been entirely thrashed out fully.

O—Simson—8.

VPT.

MSADUS:

Reference planning section, memorandum 26, battle cruiser raid. The department is of the opinion that raid by a battle cruiser against the supply lines to European ports, particularly against troop convoys, is a possibility, and that even if the chance be remote it should be guarded against. The department further notes that the decisions arrived at as modified by the action actually contemplated by the Admiralty, while guarding shipping leaving port after notice of the escape of an enemy battle cruiser has been promulgated, is in the nature of a negative decision and affords only partial relief to shipping then in transit between United States and European ports. The department therefore proposes the following definite plans for consideration and action: General note, plans to be applicable to United States troop convoys, cargo convoys to French bay ports, and convoys carrying United States troops, other convoys to utilize plan if considered desirable by the Admiralty. Plan drawn on line of battle cruiser escaping by way of the North Sea around north end of Scotland, though with slight modification it is applicable also to enemy battle cruiser escaping from Black Sea. Definite information of escape of enemy should be given to all forces before enemy has crossed Scotland to Ireland lines or has gotten clear of Aegean Sea. Plan applicable to both eastbound and westbound shipping. Special details: The Navy Department has asked the State Department to request of Japan that she detail four battle cruisers to base with the Atlantic Fleet at Hampton Roads. The North Atlantic to be divided into three areas, first west Atlantic 45 W. to United States Coast, and mid-Atlantic 20 W. to 45 W., east Atlantic 20 W. to east Atlantic destination. The United States to station division 6, consisting of the *Utah*, *Nevada*, *Alabama*, at Queenstown or Brest, preferably the former port or vicinity, to act as wider guard against battle cruiser in the mid-Atlantic and eastern section. To hold the eighth division, consisting of *Arizona*, *Mississippi*, *New Mexico*, *Pennsylvania*, to cover the west Atlantic section or to proceed where necessary. To use the Japanese battle cruisers, if they are detailed to work with our forces, for the purposes of direct pursuit. Eastbound convoys, all convoys between 45 and the United States return to the nearest United States or Canadian port, there to await for adequate escort. Furnish two old battleships as escort for each convoy carrying troops.

If practicable expend the same escort to cargo convoys, and where this is not practicable use two armored cruisers for escort to cargo convoys; all convoys east of meridian to proceed to destination at top speed; convoys between 45 W. and 30 W. divert immediately to Azores and make for an anchorage or lee under island San Miguel; convoys between 30 W. and 20 W. divert to San Miguel or proceed to destination or nearest port as circumstances demand, depending upon estimated position of enemy cruiser relative to position and speed of convoy. Westbound shipping: Shipping between 15 W. and European ports return to port to await adequate escort or divert to San Miguel, Azores, depending upon submarine situation; ships between 15 W. and 45 W. to Azores or to nearest United States or Canadian port, depending upon their proximity to those points. Ships to westward of 45 W. route to destination or to nearest port. Utilize the *Delaware* and *North Dakota* with divisions 2, 3, 4, 5, battleship force, to escort troop convoys; utilize cruiser force to escort cargo convoys; hold division 8, battleship force, with one division destroyer force instant readiness to proceed; dispatch division 6 with two divisions of destroyer force in European waters to proceed at top speed to Azores, San Miguel. Use Japanese battle cruisers as pursuit division if they are detailed to cooperate with United States forces and if such plan is agreeable to them.

Above plan to become effective immediately upon agreement and to be put into operation upon receipt of broadcasted radio and cable stating that enemy battle cruisers had escaped from North Sea. The Navy Department to maintain an adequate supply of coal and oil in European waters and Azores to meet the logistic needs of division 6, battleship force. This above plan is suggested a possible counter to any enemy battle cruiser or small force of enemy ships escaping from the North Sea and attempting to raid our lane communication before interning in some neutral port or escaping to other seas. Modification suggested for raiding force escaping from Adriatic or Dardanelles. Shipping east or west bound between meridians 20 and 45 and north of latitude 45 proceed to destination or to nearest port at top speed.

OPNAV.

Notation made by Capt. Pratt.

Sent 30 or 31 July, 1918.

Chief of Naval Operations, which he complains of, seem to me to be based on a misconception of his position relative to that of the Chief of Naval Operations.

The office of Naval Operations—that office which is charged with the preparation and operation of the fleet and of all naval forces, committed errors, some of which were as stated in Admiral Sims's letter; but that we in particular, and the Navy Department in general did not enter whole-heartedly into the campaign, I can, with authority deny. How we could best get into the campaign in the shortest time was all we thought about. With all the foresight imaginable, with all the preparation possible, it takes time to get into a war in full force. The problems which confronted us were stupendous, and Admiral Sims seems to have overlooked these difficulties, or at least he has not mentioned them. His was the task of asking for things, ours the work of supplying them. There were not issued to Admiral Sims any instructions beyond the simple statement of July 3, 1917, above referred to, for the reason that the department did not, during the entire war change its general attitude toward the policy therein indicated, though it allowed itself the right from time to time to make such concessions as would best further the allied cause. It was best fitting that this broad outline of our naval policy should go to the State Department direct and that Admiral Sims should be furnished with a copy. The department relied on him, in close touch with the Allies, while guided by its fundamental principles, to formulate all general war plans within the area of his command and to send them back to us as the basis upon which we could begin our work. Plan after plan of his was handled that way. It is a proof of the cooperation we gave him that these matters were handled in this manner.

Admiral Sims himself says, in his statement of the case, that the department did accept all of his plans and policies some six months after they were first made, but he does not seem to realize that they were the basis upon which we worked from the start. As to the adequateness of plans made ahead of time to cope with the particular situation which confronted us upon entry into the war, it can be said that the general board, which was the father and custodian of plans, had in its files many of them made in peace. None fitted this particular case in war. And none could ever meet this situation efficiently until Admiral Sims, as he himself has told us, could get in touch with the Admiralty and with the naval departments of the Allies and find out from them the real needs of the war. And he does not know, or at least he does not state that upon the basis of this information, in the early part of June, the process of switching the entire building program of the Navy from its battleship construction to chasers, destroyers, tugs, aircraft, and supply ships was begun. More destroyers were added in an entirely new program and room made on the ways for merchant ships. To-day I can find nothing in the evidence presented which makes me change my mind as to the soundness, in the main, of the policies indicated as the department's policies. In war, the Secretary of the Navy must lean on his naval adviser, the Chief of Naval Operations, who with his aides must assume the responsibility of the general conduct of the naval operations of the war. Subject to instant removal from office by the Secretary, if he is derelict in his duties, or fails to have the broad

grasp of the situation which the gravity of war necessitates, the naval head must have military control in naval matters, and must accept the responsibility for the same.

This situation was accepted, the operations of war conducted along these lines. To have interfered in military matters would have been folly, and this the Secretary of Navy (for he represents the Navy Department) did not do, so far as plans, policy, and operations are concerned, at any time when I was acting Chief of Naval Operations, while Admiral Benson was absent aboard. The competency of the military head to make decisions on military matters was not questioned. That there were delays, that there were mistakes, that it took time before we got into this war in full force, is fully and frankly admitted, but that the guiding and directing heads in Washington of our naval establishment had, in the main, any misconception of their mission, or lacked in their willingness to fully cooperate with the Allies, I deny. Some of the reasons why our Navy did not more quickly enter into the war in full force are perfectly natural reasons, and will happen in any war. With the knowledge gained in this war, some might be avoided in future. Some of those which I think might be avoided are, lack of material preparation in the ships commissioned, lack of adequate supplies, and supply and repair bases, lack of sufficient personnel and facilities to train same; a building program planned specifically to meet the needs of the war the country intends to engage in, modern methods of organization and administration, and the maintenance of these nucleus organizations in peace, a budget system, an adequate sum of money ready at hand to be used at once as necessity dictates, a sum not to be mortgaged for any other purpose than that of national defense. But behind all these details there must be the determination of a united people, expressed through the proper authorities, that they desire and will declare war within a certain specified limit of time, and that within this limit of time they will give, through the proper channels, to their military leaders the power and means to so prepare and organize, that at the appointed time these organizations may strike.

This practically presupposes a military and autocratic form of government, for in no purely democratic government do I believe this instant preparedness will ever exist. The two forms of preparedness, and the most efficient which it is thought a democratic government will ever sanction lies first in its fleet and second, in certain essential methods of training of the youth of our country. Behind the barricade of our fleet all other war preparations may ripen. The readiness to strike instantly has always been the military man's dream. This thought is aggressive. It savors of the motives that have impelled the great military nations of the world. It grips our naval and military men's minds, though they be thoroughly democratic at heart, because the habits of a life time and thought have tended to make them see more clearly along the straight road of mechanical efficiency, than down the more devious but natural paths that human nature treads. The truths of my assumption are, I believe, to be found in the history of Great Britain, one of the greatest democracies in the world. Especially would I point to her position at the time this great war broke. With an experience in European wars much greater than ours, with a warning of what might take place well ahead of time, the initial stroke found her un-

prepared to wage an aggressive war. Behind her fleet she was forced to build up her military strength. Behind the bulwarks of the allied and of our own fleets, we built up our full military and naval strength. A democratic government will, in my opinion, never be prepared to wage aggressive war in full strength, at the start.

Admiral Sims has presented his evidence against the department and particularly against the Office of Operations, with a great array of facts. Facts are like bricks; properly assembled they form an imposing edifice, but if this structure is to be enduring, these facts must be united by the cement of sound reason. In making any just estimate of the situation which confronted our Navy, both at its entry into and during the progress of the war, no one man's opinion, however important be his post, can be given undue weight, but all of the conditions and influences here and abroad which acted on our naval war problem as a whole must be put in the balance and weighed. This problem was never localized. Our total naval effort had to be so adjusted that its weight was thrown to greatest advantage against the enemy forces as a whole. To this end it was necessary that we coordinate both abroad and at home our efforts with those of all our allies and with our own military and civil forces. This the Navy did successfully, as its record shows.

There is one charge, and only one, in this whole controversy which is grave, and this was not in the original letter. It is as follows:

I am convinced that our failure to give adequate support with the means at our disposal during these first six months seriously and unnecessarily jeopardized the outcome of the whole war. In my opinion, it undoubtedly resulted in lengthening the war by several months, through the increased losses in merchant shipping that resulted therefrom. I believe that this failure, combined with the equally grave one of neglecting to prepare adequately during the few months previous, and the few months subsequent, to our declaration of war, probably postponed victory four months. Since the average loss of life per day was about 3,000 and the total daily cost was more than \$100,000,000, it can be appreciated what this delay meant to humanity, and how serious was any fault that resulted in materially prolonging hostilities.

I have told you of the Navy's struggle to prepare after war was declared. You have the figures showing the number of our destroyers, the best type of antisubmarine craft in the world, and other antisubmarine craft sent to Europe. You have been told of the plans made to build more destroyers. You have had testimony as to our willingness to cooperate in every way possible. What does Admiral Sims mean by the words, "I believe that this failure, considered with the equally grave one of neglecting to prepare adequately during the few months previous, and the few months subsequent, to our declaration of war, probably postponed victory four months." What does he mean? Can we, a nation at peace, and bound by the laws of neutrality, can we, no matter what our inclinations may be, perform those overt acts of preparation, which are only justified as acts of war? A mass of figures, cables, and data have been submitted to substantiate the assumption made that our delay put victory four months behind, and cost humanity the price stated. This I deny. I wish to introduce a bit of evidence which controverts Admiral Sims's assumption that the few remaining craft we had on this side of the ocean could have been an influencing factor upon the early termination of the war. That power did not lie in the relative

distribution of our forces but in the relative distribution of the forces of the British Navy.

I have here a plan of January 21, 1918, from the London planning section, of which I wish to submit only extracts. I will hand this manuscript to you gentlemen so that you may read it. You will see there are certain statements made in that plan which it would not be wise to publish. You can read the figures that I have taken and put in this memorandum so as to see that I have made no mistake about the figures.

The CHAIRMAN. You cover everything in the memorandum that you wish to submit?

Capt. PRATT. Yes; I think so; but I hand this to you because I would like to have you see the reasons, down there, why I would prefer not to submit it as a whole. [Reading:]

Memorandum showing the relative proportions of destroyers with the Grand Fleet and engaged in antisubmarine warfare exclusively. Date, January 21, 1918.

When I make this statement in regard to the destroyers with the Grand Fleet, remember that I do not say they were not used to a certain extent on convoy operations. They were. I have inquired of Admiral Rodman as to exactly the operations that they participated in. But I do state that this was a minor function of theirs, and that their major function was the screening and operating with the Grand Fleet; so that their antisubmarine operations, therefore, were not of as great importance as those of the craft that were detailed exclusively for antisubmarine work. [Continuing reading:]

This data is taken from the plan furnished by Admiral Sims's planning section in London. The figures are, therefore, their own. The problem is known as Problem 2. It was worked out on January 21, 1918, and the figures fairly well represent the conditions that existed throughout the summer, spring, and fall of 1917. In the solution of this problem it was decided that the basic naval mission was "To further a successful decision on land."

The general mission was, "To obtain command of the sea."

The immediate mission was, "To obtain subsurface command of the sea, while retaining command of the seas."

Translated into ordinary language it meant just what Admiral Sims meant, "Get everything after the submarine you can, and get after him as hard as you can, provided that in so doing you do not jeopardize your chances of control of the surface of the sea." To maintain surface control the Grand Fleet had to be held ready at instant notice and it had to be guarded by destroyers, the best antisubmarine craft known. It is all granted. However, the interesting feature in this as bearing very distinctly on the antisubmarine efforts going on around the British Isles lies in the distribution the British themselves made of their destroyers. I will quote the figures:

With the Grand Fleet, 111 destroyers.

In British Isles, apart from Grand Fleet, 213 destroyers, of which 37 were United States destroyers.

NOTE.—The above vessels are engaged in escort duty and antisubmarine work.

The CHAIRMAN. That is taken from this manuscript of this memorandum?

Capt. PRATT. Yes. The 213 vessels were engaged in escort duty, in antisubmarine work. I will submit another paper bearing on the same subject.

The CHAIRMAN. Would there be any objection to putting this complete manuscript in with the paragraphs to which you have referred deleted?

Capt. PRATT. No, sir.

The CHAIRMAN. The British would have no objection to that being done?

Capt. PRATT. I do not think they would.

Senator PITTMAN. Then, we will put that in, following your discussion of this subject?

Capt. PRATT. Yes, sir.

The CHAIRMAN. There is nothing else objectionable except the paragraphs you have marked?

Capt. PRATT. I would like to scan that a little more closely. Mr. Chairman, and then I will just put red marks through what should be left out.

The CHAIRMAN. Very well.

The memorandum referred to, and the plan of the London office with necessary omissions, are here printed in the record as follows:

RELATIVE PROPORTIONS OF DESTROYERS WITH THE GRAND FLEET AND ENGAGED IN ANTISUBMARINE WARFARE EXCLUSIVELY.

JANUARY 21, 1918.

This data is taken from the plan furnished by Admiral Sims's planning section in London. The figures are therefore their own. The problem is known as problem 2. It was worked out on January 21, 1918, and the figures probably fairly well represent the conditions that existed throughout the summer, spring, and fall of 1917. In the solution of this problem it was decided that the basic naval mission was "to further a successful decision on land."

The general mission was, "to obtain command of the sea."

The immediate mission was, "to obtain subsurface command of the sea, while retaining command of the seas."

Translated into ordinary language it meant just what Admiral Sims meant. "Get everything after the submarine you can, and get after him as hard as you can, provided that in doing so you do not jeopardize your chances of control of the surface of the sea." To maintain surface control the Grand Fleet had to be held ready at instant notice and it had to be guarded by destroyers, the best antisubmarine craft known. It is all granted. However, the interesting feature in this as bearing very distinctly on the antisubmarine efforts going on around the British Isles lies in the distribution of the British themselves made of their destroyers. I will quote the figures: With the Grand Fleet, 111 destroyers; in British Isles apart from Grand Fleet, 213 destroyers, of which 37 were United States destroyers.

NOTE. The above vessels are engaged in escort duty and antisubmarine work.

[Memorandum No. 8.]

LONDON PLANNING SECTION—*Problem No. 2.*

JANUARY 21, 1918.

General situation: As at present.

Special situation: The Allies and the United States have decided to continue the war to a victorious peace.

Required: Estimate of the general naval situation in relation to the war as a whole.

CONCLUSION REACHED.

General: (1) To provide for united action of allied naval efforts in conformity with the naval missions and irrespective of local situations and special interests; (2) to unify commands where desirable in certain areas, such as the English Channel and the Adriatic; (4) to reinforce the Grand Fleet with United States battleships if the barrage operations require it, or, if thereby troops in Great Britain can be released for service in France; (5) to develop plans for concentrated air attacks on enemy submarine bases in the North Sea and the Adriatic; (6) to develop plans for attacks with surface vessels against enemy Adriatic bases; (7) to prepare to destroy Russian Baltic ships should their capture by the enemy become imminent; (8) to give special study to the matter of mine barrages in the English Channel and the Adriatic and Aegean Seas.

Antisubmarine: (1) To devote the maximum possible antisubmarine force to offensive operations; (2) to develop with the greatest possible rapidity hunting groups equipped with listening devices and manned by the best trained personnel available from all sources; (3) to equip vessels engaged in antisubmarine warfare with adequate means for taking the maximum tactical advantage of every contact with an enemy submarine; (4) to arm heavily (with full gun's crews for each gun) about 1 merchant ship in 10, of each general class, in the North and South Atlantic; and as far as practicable to escort convoys with such heavily armed merchant ships.

DISCUSSION OF PROBLEM.

The following discussion of the problem was set down by the planning section in order to clear up their understanding of the problem and thereby facilitate its solution.

The problem proposed is the most general of all naval problems of the war now in progress.

From the standpoint of joint naval action the statement of the special situation and of what is required in the solution must be accepted as sound. If we aim at anything less than a victorious peace, we are led to put forth less than our maximum effort and we commit ourselves to a military policy which can never support properly the aims of belligerents. War has for its object to impose our will upon the will of the enemy. The surest method of achieving this object is by victory, for then the enemy is compelled to submit and the maximum degree of permanency is given our achievement.

If we determine upon lines of procedure that are not in proper support of the war as a whole, we thereby favor special interests and introduce friction among Allies that may create dangers of the first magnitude.

METHOD OF SOLUTION.

The solution of a problem so general as this one is the first step in the formulation of a general plan of action. The first step in the solution is to determine a statement in concise form of that which the conditions of the problem require should be accomplished. This statement in the first instance takes a sufficiently inclusive form to cover the entire task to be undertaken. A further examination of the task thus determined in connection with special circumstances may enable us to determine upon a more concrete statement of the task. When the most thoroughly concrete, and at the same time, inclusive statement of the task is determined, we thereafter investigate the ways of accomplishing the task determined upon and finally decide upon a definite way for its accomplishment. Thereafter, whenever any related question arises for decision, we must examine it in the light of the task to be accomplished and decide the question in the way best calculated to support the effort to accomplish that task. If the most concrete statement of the task is not sufficiently general to guide us in our decision, we must refer our question to the next more general statement of the task, or, as we call it, the mission.

In the problem under consideration, we approach the determination of our naval mission as follows:

DETERMINATION OF OUR NAVAL MISSIONS.

The fundamental end in view, of sea power is the support of land power. Success on the sea alone can not force peace terms as favorable as those to be gained by corresponding success ashore. The effectiveness of sea power is, therefore, to be measured by the degree of success with which it fulfills its rôle as the support of land power.

From these considerations are deduced the basic naval mission in this war: "To further a successful decision on land."

The best general means of bringing about sea conditions favorable to shore success, lie in the establishment of command of the sea. Such command is useful only insofar as it furthers command of the land, and is not, therefore, within itself an ultimate objective, but merely one of the preliminary means essential to that end. When it is accomplished, the resources of the friendly and neutral world are made available for the logistical support of our Army and people, and we gain the strategic freedom offered by the sea to strike with, or at, shore power in otherwise inaccessible places, while the enemy is at the same time correspondingly restricted.

The general naval mission is therefore: "To obtain command of the sea."

Command of the sea may be established either by destroying enemy naval forces, by effectually containing them, or by so nullifying the effect of their activities as to reduce it to negligible proportions.

At the present time, partial command of the sea has been established by the forces of the Allies and the United States. The enemy's surface craft are effectually contained by an overwhelming force within the immediate vicinity of his home waters—the Adriatic and the Baltic. The enemy fleet commands the Baltic and is free to enter the North Sea, but no movement on its part in these waters can have a serious influence upon our land operations.

The high seas fleet is rendered practically impotent by the mere presence of the Grand Fleet covering the exits of the North Sea. On the other hand, the submarine command of the sea has not been even approximately established. The enemy submarines enter freely the Atlantic and prey upon commerce with the avowed object of impairing the supply and morale of allied civil populace and armies in the field. In other words, submarine warfare is directed against land power, upon which sea power rests and for the maintenance of which it exists solely.

The enemy is making of submarine warfare his principal naval effort, thus conforming directly with his basic naval mission of "furthering a successful decision on land." We are concentrating our major effort on maintaining surface command of the sea, which is doubly assured, while by virtue of his command of the subsea the enemy is placing our land power in serious jeopardy.

Our tonnage losses, with corresponding shortages of fuel, food, and munitions, are already having a great influence on the morale of the civil populations, elevating the enemy's morale, depressing our own. These losses and shortages are already affecting seriously the main land strategy in Italy and France. They have already made it impossible for the United States to develop quickly its full strength on the western front.

Sinkage of and damage to shipping due to torpedoes, mines, and accidents attributable to the submarine warfare, continue greatly in excess of repairs and new construction and at a rate which is alarming when viewed from the standpoint of that support to the land power that is essential to prevent defeat.

Our special and immediate mission therefore becomes: "To obtain subsurface command of the sea, while still retaining command of the surface of the sea."

Enemy forces—their strength, disposition, and probable intentions.

ALLIED NAVAL FORCES.

British Isles (British and United States).

- (a) Grand Fleet (6 Jan.):
 41 dreadnaughts.
 11 battle cruisers.
 31 light cruisers.
 7 cruisers.
 13 flotilla leaders.
 111 destroyers.
 12 T. S. mine sweepers.
 36 trawlers.
 18 sloops.
 38 submarines.
 5 hydrophone ships.
 3 seaplane carriers.

ENEMY NAVAL FORCES.

North Sea.

- (a) High Sea Fleet:
 19 dreadnaughts.
 5 battle cruisers.
 10 light cruisers.
 2 mine-laying cruisers.
 88 destroyers.
 50 torpedo boats.
 30 M. boats.
 45 trawlers.
 (b) Harbor flotillas:
 13 destroyers.
 24 trawlers.
 (c) Naval forces in Flanders:
 15 destroyers.
 16 torpedo boats.

(d) Naval forces in Baltic:

- 3 light cruisers.
 42 destroyers.
 8 torpedo boats.
 6 M. boats.
 116 trawlers.

(e) Submarine force (including Flanders force):

- 5 light cruisers (old).
 9 destroyers.
 16 torpedo boats.
 6 U. cruisers.
 54 U. type.
 50 U. B. type.
 20 U. C. type.

(f) Training center:

- 8 old battleships.
 3 light cruisers.
 12 destroyers.
 5 torpedo boats.
 20 submarines.

(g) Vessels not embodied in regular formation:

- 10 old battleships.
 6 coast-defense ships.
 3 cruisers.
 13 light cruisers.
 2 mine-laying cruisers.
 33 mining vessels.
 21 destroyers.
 51 torpedo boats.
 50 armed merchant vessels.
 6 auxiliary mine layers.

Summary of British (and United States) forces available for fleet engagement.

Assuming that forces (b), (c), and (f) are available, also local defense destroyers at Scapa Flow, there can be assembled to meet the enemy force—

- 41 dreadnaughts.
- 11 battle cruisers.
- 43 light cruisers.
- 7 cruisers.
- 22 flotilla leaders.
- 184 destroyers.
- Submarines.

If the above assumption shall not hold, the Grand Fleet will have—

- 31 light cruisers.
- 13 flotilla leaders.
- 111 destroyers.

Probable additions by July 1, 1918.

4 dreadnaughts (United States).

Summary of North Sea Forces.

The following summary gives the maximum number of vessels that Germany could bring to bear in a general fleet engagement:

- 19 dreadnaughts.
- 5 battle cruisers.
- 34 light cruisers.
- 4 mine-laying cruisers.
- 196 destroyers.
- 146 torpedo boats.
- 18 old battleships.
- 3 old cruisers.
- 6 auxiliary mine layers.
- 150 submarines.

The torpedo boats are of no value except perhaps in an engagement near the German coast. Probably not more than 8 or 10 of the old battleships are in condition for sea.

Probable additions by July 1, 1918.

- 2 dreadnaughts.
- 2 battle cruisers.
- 2 light cruisers.
- 2 mine-laying cruisers.
- 12 destroyers.
- Torpedo boats.
- 70 submarines.

Total forces in British waters apart from Grand Fleet (a).

- 13 light cruisers.
- 213 destroyers.
- 9 flotilla leaders.
- 15 monitors.
- 68 submarines.
- 64 torpedo boats.
- 23 sloops.

The above vessels are engaged in escort duty and antisubmarine work. (Does not include trawlers or small patrol boats.)

Possible addition of Russian Baltic Fleet.

It is possible that the following units may be captured or turned over to Germany:

- 4 dreadnaughts.
- 3 predreadnaughts.
- 9 cruisers.
- 60 destroyers (approximately).

French forces in Atlantic.

- 24 destroyers.
- 59 torpedo boats.
- 25 submarines.
- 92 trawlers.
- 40 sweepers.
- 100 patrol boats.
- 10 gunboats.

These vessels are distributed in the channel and Bay of Biscay ports.

United States naval forces in French Atlantic.

- 30 armed yachts and trawlers.
- 7 destroyers.

French forces in Mediterranean.

- 7 dreadnaughts.
- 8 predreadnaughts.
- 4 armored cruisers.
- 6 old cruisers.
- 75 destroyers.
- 48 torpedo boats.
- 37 submarines.
- 17 gunboats.
- 160 trawlers.
- 250 vessels (miscellaneous).

British forces in Mediterranean.

- 3 predreadnaughts.
- 4 cruisers.
- 12 light cruisers.
- 14 monitors.
- 28 sloops.
- 45 destroyers.
- 18 torpedo boats.
- 12 submarines.

Austrian Fleet (Mediterranean).

- 4 dreadnaughts.
- 6 predreadnaughts.
- 4 old predreadnaughts.
- 2 cruisers.
- 10 light cruisers.
- 16 destroyers.
- 42 H. S. torpedo boats.
- 2 mine layers.
- 54 submarines (including German).

Probable additions by July 1, 1918.

- 2 dreadnaughts.
- 3 light cruisers.
- A few destroyers and submarines.

Turkish Fleet.

1 old battleship.
1 battle cruiser.
2 light cruisers.
8 destroyers.
8 torpedo boats.
? submarines (German).

Italian forces in Mediterranean.

5 dreadnaughts.
4 predreadnaughts.
5 old predreadnaughts.
7 cruisers.
10 light cruisers.
7 flotilla leaders.
43 destroyers.
26 H. S. torpedo boats.
50 submarines.

Japanese forces in Mediterranean.

14 destroyers.

United States forces in Mediterranean-Gil.

4 destroyers.
20 other craft.

Summary of Mediterranean forces.

12 dreadnaughts.
20 predreadnaughts.
23 cruisers.
22 light cruisers.
7 flotilla leaders.
181 destroyers.
92 torpedo boats.
100 submarines.

Summary of Mediterranean forces.

4 dreadnaughts.
11 predreadnaughts.
1 battle cruiser.
2 cruisers.
12 light cruisers.
24 destroyers.
50 torpedo boats.
60 submarines.

From an examination of the above disposition of enemy forces we see that they are divided into three general groups:

- (1) The North Sea group.
- (2) The Adriatic group.
- (3) The Sea of Marmora group.

In every case the surface craft are contained and the submarine have exit to the high seas.

Political considerations.—The entire subordination of the military and naval strategy of the enemy to his State policies requires that we have in mind his state policies and his present condition.

Military policy.—The only guide to the future policy of the German Army which we can follow is the presumption that the policy it has pursued in the past will be continued. We may assume that Germany plans to hold the western front and to direct her military offensive first against the remaining weak points of her enemies, the Palestine front, the Salonika front, and the Italian front, unless—

(1) Conditions in Germany are such as to demand an immediate decision on land, or—

(2) The Germans believe that their reinforcements on the western front, together with some recently developed surprise weapon, may give them reasonable assurance of victory.

In examining the probable intentions of the enemy, we have first of all to consider the mission imposed upon his naval forces by his situation and aims.

The war that the enemy is waging is a land war. He must succeed on land if he is to dictate the terms of peace. In order to dictate the terms of peace, he must break down the will of his strongest enemies. His strongest enemies are on the western and on the Italian fronts. If he succeeds on both of these fronts, he will win the war. His strategy to date has been to strike on the weaker fronts, while holding the stronger fronts. He has endeavored to deprive one front after another of the ability to take the offensive. He has been successful in this on all important fronts, except the western front. He has utilized his successes to strengthen his forces on the more important fronts.

From the beginning of the war, he has realized that the great effort of his enemies on the western and on the Italian fronts had to be supported by way of the sea. He has organized the support of his own forces and directed his own land strategy so that he could do without sea communications outside the Baltic. His basic naval mission has, therefore, been to give the maximum support to his land forces in obtaining a successful decision on land.

The special features of his strategic position have caused him to conclude that he could best support his land forces by naval effort if he concentrated that effort on—

The maximum possible sustained attack on the sea communications of the Allies.

There can be no question but that this is the governing mission of his active naval forces to-day and that it will continue to be their governing mission. Knowing this

But we must not lose sight of its importance nor fail to avail ourselves of the opportunities that the knowledge gives us. The enemy thinks and acts according to his training. He has been taught the doctrine of concentration of effort so long that now it is a part of his nature. He first determines his mission and then devotes all his energy to the accomplishment of that mission. He never loses sight of his mission. Side effort is no part of his plan, except it promises more toward the accomplishment of his mission than direct effort. He sees his goal and goes toward it with all the power at his disposal.

The enemy has found that his high seas fleet can not attack the sea communications of the Allies. He has found that his submarines alone are capable of a sustained attack on the sea communications of the Allies. These facts compel him to assign the principal active rôle in the accomplishment of his naval mission to his submarines. Such assignment appears to leave his high seas fleet without a clearly defined mission. This, however, is not the case. His submarines can not do their work unless they have access to the high seas. His submarines are incapable of maintaining for themselves a freedom of exit to the high seas, but must depend for this upon the high seas fleet.

The mission of the high seas fleet is therefore so far as their principal activity is concerned—

To further the submarine campaign to the maximum degree.

This mission includes as an immediate and continuous mission to maintain freedom of passage to and from the high seas for submarines.

Enemy surface craft in the Heligoland Bight, in the Adriatic, the Kattegat, and the Straits of Dover, have always striven to keep clear the way for his submarines to the open sea. Their activities have not indicated any other definite intention—any other mission than that given above. We do not refer here to isolated instances of raiders and raiders.

The high seas fleet serves other and very important purposes for the enemy. Without the high seas fleet, Germany could not even dream of an invasion of England; with the high seas fleet the threat of invasion is sufficient to immobilize a large number of troops in England that might otherwise be on the western front. Further, the high seas fleet, by its mere existence in readiness, compels the immobilization of a superior naval force that must be held ready to meet any move the high seas fleet may make, which force might, except for the existence of the high seas fleet, be used in anti-submarine effort. It would obviously be unsound for the high seas fleet to engage in any enterprise that would greatly impair its threat or its holding power, unless that enterprise gave promise of a favorable decision of the war.

The enemy's strategy on land is closely associated with his strategy on the sea. The enemy attack on the communications of our armies is not for enemy naval forces alone. Enemy armies participate in this attack. The defeat at the Dardanelles was a distinct blow to our communications. It denied to us the war treasures of the Black Sea, and equally denied to the Russians a channel of reinforcement. The enemy advance in Belgium to the coast was a distinct attack on the communications of our armies on the western front. It opened the Belgian ports to his submarines and gave them the great advantage of proximity to areas congested with our shipping. We are now in a position to examine the probable intentions of the enemy and then to make use of these in determining upon our own courses of action.

In striving to accomplish his missions, we may expect the enemy to:

- 1) Continue his present submarine campaign.
- 2) To enlarge the theater of submarine activity as fast as our antisubmarine measures become effective in congested waters.
- 3) To operate his cruiser submarines in distant waters to encourage a dispersal of our forces and to give his cruiser submarines greater tactical freedom. The locality in which a vessel is sunk is no longer of great importance. Quantity of tonnage sunk is what the enemy desires first.
- 4) To continue to control the Heligoland Bight, the Kattegat and the Baltic with his high seas fleet.
- 5) To concentrate his air activity in support of his land forces except in so far as aircraft may be required for the protection of naval vessels near their bases.
- 6) To intensify his submarine campaign in support of his military offensive—wherever that may be.
- 7) There is one possible intention of the enemy that needs careful consideration. He must assume that he knows of the proposed barrage. He must know that we expect to make that barrage effective. He will surely see that we would not make so great an effort without at the same time closing the Straits of Dover. The two efforts, if successful, mean the blocking of his submarines. The mission of his high

seas fleet is to prevent such a blockade. How will that fleet accomplish that mission? On account of his numerical inferiority in surface vessels, the enemy will foresee the necessity for a base nearer to the barrage than any base that we possess. He will not hesitate to secure the great advantage such a base would give him.

OUR OWN FORCES—STRENGTH, DISPOSITION, COURSES OF ACTION OPEN TO US.

Strength and disposition: As shown above.

COURSES OPEN TO US.

It is well to repeat the mission of the allied naval forces:

"To obtain subsurface command of the sea, while still retaining command of the surface of the sea."

The attainment of the subsurface command of the sea is to-day of paramount importance to the allied forces. Victory or defeat depends upon an immediate solution of this problem. Submarines have sunk 12,000,000 tons of merchant shipping since the beginning of the war, and the sinkings continue at an average rate of 500,000 to 600,000 tons per month. The effect of the shortage of shipping is apparent on the whole allied front from the North Sea to Mesopotamia.

CONCENTRATION OF EFFORT AND UNITY OF ACTION.

These conditions are necessary for the successful prosecution of war, and are especially so in the antisubmarine campaign, where the maximum effort of all the Allies is essential and where escort requirements have led to a great dispersal of force.

Greater results can probably be obtained with our air forces and with inshore forces by placing all operations in certain areas, such as the English Channel or the Adriatic, under one command.

The Allies and the United States are handicapped by the lack of central direction to political, military and naval effort, and by the difficulties of coordination, due to differences of language, race, and political aims, as well as to lack of common doctrine of war.

Individually we are handicapped by a less perfect system than that employed by the enemy to harmonize military effort, naval effort and state policy, and to organize and use the entire resource of the state for war. The success or failure of the present military and naval councils will depend on the extent to which they can harmonize and coordinate the allied efforts and bring about unity of action for the purpose of winning the war.

COMMAND OF THE SEA.

"Command of the sea" includes two distinct ideas:

(1) The free use of the sea for one's own forces and commerce.
(2) The denial of such use of the sea to the enemy. Both of these advantages may be obtained by driving all enemy fighting craft from the sea. During the period when the command of the sea is not complete, we require two forms of military effort:

(1) Offensive effort directed against all enemy vessels and where possible against their bases.

(2) Defensive effort, which in general gives local protection to vessels at sea.

SURFACE COMMAND OF THE SEA.

The Allies have retained surface command of the sea since the beginning of the war. Isolated raiders have escaped from the North Sea, and attacks have been made on the English coast, and Norwegian and Dutch convoys, but such enemy action cannot be entirely prevented, and has but a small influence on the course of the war.

The Grand Fleet has superiority of nearly 2 to 1 over the high sea fleet in all units except destroyers.

The mission of the high-seas fleet is "To further the submarine campaign to the maximum degree."

We are reasonably certain that the high-seas fleet will never seek decisive action nor place itself in serious jeopardy, unless it is necessary to secure the free passage of the submarines to the open sea.

The following present and future features of the North Sea situation may render an increase of the Grand Fleet necessary:

(1) The possible addition of the *Prinzess Alice* to the enemy forces—4 dreadnoughts and about 60 destroyers.

2 The added sense of security that the Grand Fleet reinforcements will give to Great Britain against any fear of invasion.

3 Future developments in connection with the North Sea barrage which may require considerable detachments from the Grand Fleet.

4 The escape to the Atlantic of enemy battle cruisers and commerce destroyers. The addition of Russian battleships to enemy forces can be met by the transfer of United States battleships to European waters. The Russian destroyers may be met by new construction, the transfer of destroyers from antisubmarine operations, or the addition of Japanese destroyers.

Our submarines in the Baltic may destroy Russian ships when danger of the enemy reaching them over becomes imminent. It is important that the enemy be prevented from getting many Russian destroyers, if possible.

Large detachments for the protection of the North Sea barrage, or for running down enemy battle cruisers in the Atlantic, battle cruisers are of great value.

In the Adriatic, surface command is held in great force by the Allies over the Austrian and Turkish fleets. Even the withdrawal of Italy would still leave a sufficient excess of force.

Owing to future probable difficulties of maintenance of capital ships in the Mediterranean, the destruction of the Austrian fleet is of importance. Of greater importance is the destruction of enemy submarine bases, which may be undertaken by our surface and air forces.

ATTACK ON ENEMY BASES.

The destruction of the submarine bases would be an effective method of solving the submarine problem.

The enemy North Sea bases may, however, be considered as impregnable. Apart from fortifications, the physical features of the coast, with the extensive banks and shoals, low land, and narrow and tortuous channels, leading up to the principal naval bases, render a combined naval and military expedition against them a desperate undertaking with practically no chance of success.

The destruction of these bases depends upon the future development of air craft. Present machines have insufficient radius to attack Wilhelmshaven or Kiel.

Zeebrugge, however, is within easy air distance of England or France. Numerous raids have been made on this place, but owing to the provisions made to protect submarines from air attack, and to the advantage offered by the Bruges Canal to disperse and hide submarines, it is probable that the results have been small.

Zeebrugge appears to be of sufficient importance to warrant the concentration of adequate air power to maintain a permanent air superiority, and to continue bombing until it becomes untenable as a submarine base. Such an effort will also undoubtedly have a direct result on the military campaign in France.

The Adriatic bases are all within easy air distance of the Italian coast, and an intensive attack on all these bases should be considered. The additional destruction of the Austrian surface fleet would have a valuable effect in releasing the colliers and supply vessels required for the Allied containing force.

Such a campaign on a large scale against submarine bases in both the North Sea and Adriatic will involve withdrawal of many air planes from present patrol work, and will require a reconsideration of the present plans of widely distributing air stations along the coasts.

During the month of December, British air craft covered 140,000 miles in anti-submarine work; 23 submarines were sighted, 20 attacked, and none were sunk. The effort seems out of proportion to the results achieved. Beyond any doubt, a concentration of this effort on a known base, easy of access, would have yielded greater results.

Concentrated offensive air power in Flanders and southeast England will not only accomplish greater results against submarines, but it will also relieve the air threat against London, definitely give us command of the air at a great strategic point, and directly assist the armies in the field—the ultimate object of all our naval and air effort.

MINING IN SUBMARINE BASES.

This has been tried, both off Zeebrugge and off Heligoland, during the war. While it may have resulted in the losses of some submarines, the general result has been a failure, as the enemy soon clears a passage. In such future operations it may be assumed that to be effective the barrage must be patrolled. The laying of mine barrages in the Adriatic and Aegean Seas should receive consideration.

DOVER AND NORTH SEA BARRAGES.

At present there is under way the placing of the Dover and North Sea barrage in an effort to contain submarines in the North Sea.

As this effort is on as great a scale, certain features which involve its success or failure should be discussed in full.

We have recently had an example of a barrage patrol in the Strait of Otranto. The supporting bases were near. The weather conditions better than in the North Sea. Capital ships in comparatively great strength were in the near vicinity, and yet it was not practicable to maintain a patrol barrage. The attacking force could attack and get away without serious danger of being cut off because it occupied an interior position. Information of its movements always came too late to permit any action by allied forces that were not at sea on the line of retreat. The patrol had to be abandoned.

We may expect similar action and similar results in the North Sea unless we station our supporting forces in advance of the barrage. Manifestly it is impracticable to hold supporting forces of large vessels continuously at sea in advance of the barrage. The Scotland-Norway patrol was abandoned because of submarine activity. The problem then is to find a way of holding strong forces in readiness between the enemy naval bases and the barrage. We see no way of doing this except by occupying a harbor on the Norwegian coast. Fanciful schemes of mined-in areas at sea might be discussed, but the conclusion would still be the same.

In considering harbors that may be available, we should give preference to those harbors having the greatest capacity that are capable of secure temporary defense. As the war progresses and the passive features of the barrage become more effective we must expect increased effort to break the barrage so that the attacking defense of the barrage may become a matter of fleets.

There is an advantage in selecting a base some distance south of the barrage, for the following reasons:

(1) Increased probability that a movement toward the barrage will be detected in time to give warning.

(2) Increased opportunity to intercept any force that raids the barrage patrol.

(3) Denial to the enemy of all positions north of the base selected.

The mission of the force will be "to intercept and destroy any enemy force of surface vessels that may approach the barrage."

Enemy forces that have operated so far from base as the barrage are of three classes—submarines, merchant-ship raiders, and light cruisers. If greater strength is needed in the raiding force, the next step would be to send battle cruisers.

Whatever is sent on these expeditions will have high speed. The mission of the expedition will be the destruction of patrol craft, since these are the vessels that block the way of the submarine. Having destroyed the patrol craft, the next mission of the expedition will be to get home. If it is pursued by slow vessels—battleships, for instance—it will experience no difficulty in getting home. We are, therefore, compelled to assign powerful high-speed vessels to operate from the proposed base. The number of these vessels should exceed the number of similar vessels likely to be sent against the barrage. They should be reinforced by an information service of light cruisers and of listening vessels capable of giving timely warning.

It is of course desirable that the base for patrol craft should be near the area they patrol.

We have now arrived at the following conclusions:

(1) The base for supporting vessels should be between the barrage and the enemy bases.

(2) The supporting vessels should be battle cruisers. Battleships may be used in addition, but would be of small use unsupported by battle cruisers.

(3) The supporting force should include an information service of light cruisers and listening vessels.

CONVOY OF SHIPPING.

This has greatly reduced the loss from enemy action, and must be adhered to until losses have been considerably reduced from the present rate. Convoy has serious disadvantages, however, among which are:

Reduction of efficiency of shipping (estimated to be about 50 per cent).

Losses by collision.

The loss of efficiency can be decreased by:

Better utilization of speed.

Convoys to make the best possible speed from port to port.

Thorough instruction of merchant officers in rules for convoy.

Placing all merchant vessels and personnel of the allied countries under Government control.

ENEMY ANSWER TO A CLOSE INSHORE OPERATION.

When operations inshore become too dangerous the enemy submarines will naturally move further offshore. Forcing them to this will be decided gain, as shipping will be harder to find and the maintenance of submarines on station more difficult. On the other hand, the greater number of patrol vessels are unsuited for deep-sea work, and the greater immunity of submarines will partially counterbalance the difficulty in finding shipping, and the disadvantage of the necessarily reduced number of submarines on station.

It is probable that the development of antisubmarine methods on the European coast will result in an attack in force on shipping along the United States Atlantic coast, Gulf of Mexico, and Caribbean. Submarine fuel carriers will permit of submarines remaining for a considerable period in the western Atlantic.

SUBSURFACE COMMAND OF THE SEA.

As has been stated, this is the greatest and most vital problem that confronts the Allies to-day. It must be solved, and solved quickly. The outcome of the war depends upon it. In its achievement the line of action will be guided by the following principles:

1. The offensive should be followed in every possible case.
2. Greater results are promised by action close to enemy bases.
3. A pure defensive leading to the dispersal of units over great areas has practically no hope of success. The effort involved is prohibitive as compared with that of the enemy.
4. Every contact with a submarine should be followed by the maximum tactical offensive effort for its destruction.

The present surface command of the sea is largely a passive effort governed by the idea of an offensive whenever the opportunity presents itself. Subsurface can be obtained only through offensive effort. All other effort is palliative. The conclusive effort must be offensive, even in its palliative measures. The offensive idea in anti-submarine warfare is of specially great importance. The submarine navigates in three dimensions. Every time it is forced to submerge it enters a danger zone disturbing to morale. Every time it is forced to submerge off soundings it enters a zone of special danger where any outward event may mean disaster. When we limit our antisubmarine measures to escort duties, we do the thing most calculated to favor the morale of the submarine personnel. The crews lead a comparatively placid life except when they are about to attack; then all hands are called and they go about their duties deliberately according to plan. If, however, we can convert this feeling of comparative security to one of constant tension, the effect will show immediately in increased submarine losses. Greater strain, more frequent emergencies, and the consequent general feeling of insecurity incident to being the chased instead of the chaser, can not but have a marked effect.

We, therefore, adopt as a principle that "The maximum possible antisubmarine force shall be devoted to offensive operations." Offensive operations against submarines finally culminate in tactical situations where one or more submarines are pitted against one or more submarines or surface vessels. The entire submarine problem as it exists to-day is nothing but the assemblage of a multitude of tactical situations of the above nature. The successful solution of two or three typical situations would mean the ultimate solution of the entire problem. The ultimate solution to the submarine menace is tactical and not strategic.

We understand that the enemy intrusts his submarines to skilled officers specially trained to perform their specific duties. If we are to detect an effort in which initiative clearly lies with the enemy, we must oppose skill with greater skill; we must make of our antisubmarine effort a major effort that claims the best brains and the best tactical skill of the naval services. We must assure ourselves on every occasion of contact with a submarine the maximum tactical use shall be made of that contact. To realize this aim, we must prepare both vessels and personnel for their mission.

As to personnel, the solution is to be found in the best available personnel thoroughly trained in the best known methods. We feel that every branch of the United States and allied naval services is fully justified in giving large numbers of its best people to the antisubmarine service. The recent rapid development of submarine detection devices is of such a nature as greatly modify the tactics of submarine search and attack. It is, therefore, necessary to train personnel in the new tactics as fast as possible. It is suggested that conferences at the Admiralty of the best qualified officers actually operating at sea in antisubmarine work would be useful in determining, improving and disseminating tactical methods.

As to vessels and their equipment, they must be ready to deliver the maximum possible attack. We may assume readiness as to the gun attack. The depth charge attack is still in an unsatisfactory condition, but rapidly being improved.

In reports from American destroyers there have been several instances of depth charges failing when, if they had not failed, the submarine would have been put down. Such instances indicate the desirability of adopting the rule of always dropping at least two depth charges simultaneously. Experience has demonstrated that the position of a submerged submarine is known with more accuracy immediately upon the arrival of the attacking vessel near the point of submergence than it is at any later time. This fact indicates the desirability of making the first depth charge attack a maximum effort. Vessels should therefore be provided with means for projecting depth charges from the stern and from the beams so that a large area of water—say, two or three hundred yards in diameter—may be covered by the simultaneous discharges and dropping of depth charges. Dropping gear for two depth charges with projectors for two depth charges located near the stern and three or four on each beam or quarter is suggested. In addition, as many depth charges as can be carried aft should be in readiness for running over the stern (mine-laying style), so that they may be laid on retiring curves. It should be a principle of action that—

The first contact with an enemy submarine shall justify the expenditure of all depth charges on board but two.

The after gun and torpedo tubes of destroyers used in antisubmarine work can be landed to make way for more depth charges, and the gear necessary for using them expeditiously.

To summarize our antisubmarine effort:

- (1) Emphasize the offensive as much as possible.
- (2) Put the best brains and skill available into the antisubmarine service.
- (3) Develop group tactics and organization by conference and otherwise. Disseminate results.
- (4) Make maximum possible use of each contact with a submarine.
- (5) Always drop at least two depth charges in first salvo, and as many more as possible. Expend all but two depth charges on first contact with a submarine.
- (6) Fit vessels to carry maximum possible number of depth charges in readiness for laying expeditiously. Remove after gun and torpedo tube on destroyers, if necessary.

The question of the cruiser-submarine is one very difficult of solution, because of its extensive field of operations. Tactically it is less efficient than the small submarine, except for the increased range of its guns. The tendency of our answer to the cruiser-submarine attack will be toward a further diversion of forces to defensive arrangements, and a further slowing up of shipping through extension of the convoy system. Even were it sound policy, it is impossible to guard shipping in distant waters against the torpedo attack of cruiser-submarines.

Greater zigzag areas, increased armament of merchant ships, increased numbers and skill of armed guards, increased vigilance regarding lights, radio signals, smoke, etc., all palliative measures, is the best reply available at present to the cruiser submarine. In connection with the increased armament of merchant vessels as a reply to the gunfire of the cruiser submarine, we suggest the special arming of about 1 merchant ship in 10 of each class with a battery of at least four 5-inch or better guns, and the assignment to these ships of a full gun's crew for each gun. As the convoy system becomes more fully organized, it will then be possible to place one specially armed ship in each convoy and thus be sure that in the absence of an ocean escort we will still have sufficient gun power with each convoy to reply to the gun fire of a cruiser submarine.

The Mediterranean situation is entirely satisfactory as to the containing of enemy capital ships, but the submarine situation is very unsatisfactory. Submarines cruise at will and safely throughout the Adriatic and Mediterranean, basing chiefly on Adriatic ports. The principal obstacle to patrol operations in the Adriatic has been the activity of enemy light cruisers and destroyers. We recommend no withdrawal of forces from the Mediterranean, but that closer study of the Adriatic situation be made with a view of a greater concentration of offensive effort against enemy naval forces. We consider the entire naval problem of the Mediterranean and Adriatic a major problem in which the United States and the Allies are all greatly interested.

The successful solution of this problem might well mark the turning point in the war.

5. To arm heavily (with full gun's crews for each gun) about 1 merchant ship in 10, of each general class, in the North and South Atlantic, and as far as practicable to escort convoys with such heavily armed merchant ships.

DECISIONS.

General:

- To provide for united action of allied naval efforts; in conformity with the naval decisions and irrespective of local situations and special interests.
- To unify commands where desirable in certain areas; such as the English Channel and the Adriatic.
- To reinforce the grand fleet with United States battleships if the barrage operations require it, or, if thereby troops on Great Britain can be released for service in France.
- To develop plans for concentrated air attacks on enemy submarine bases in the North Sea and the Adriatic.
- To develop plans for attacks with surface vessels against enemy Adriatic bases.
- To prepare to destroy Russian Baltic ships should their capture by the enemy become imminent.
- To give special study to the matter of mine barrage in the English Channel and the Adriatic and Aegean Seas.

Antisubmarine:

- To devote the maximum possible antisubmarine force to offensive operations.
- To develop with the greatest possible rapidity hunting groups equipped with listening devices, and manned by the best trained personnel available from all sources.
- To equip vessels engaged in antisubmarine warfare with adequate means for securing the maximum tactical advantage of every contact with an enemy submarine.

U. S. NAVAL FORCES OPERATING IN EUROPEAN WATERS,
May 31, 1918.

From: Force Commander.

To: Secretary of the Navy (Operations).

Subject: Correction to Planning Section memorandum No. 8.

Enclosures: Two.

1. Inclosed herewith are corrected pages 17 and 18 for Planning Section memorandum No. 8, a copy of which was forwarded to the department on February 22.
2. The changes from the pages 17 and 18 previously forwarded are such as to eliminate from the memorandum all reference to the seizure of a base in Norway.
3. All copies of this memorandum which were furnished to the allied naval council and to the British Admiralty were altered in accordance with the inclosed corrected sheets.

SMS.

Capt. PRATT. I will submit this plan, also, because there is nothing in this that I think is in the least degree objectionable. It is dated 15th of March, 1918, and is by the London planning section.

PLANNING SECTION—MEMORANDUM No. 18—PROBLEM No. 10—ANTISUBMARINE
POLICY.

General situation.—As at present. The shipping situation is becoming more and more critical. Unless a check is placed on the enemy's submarines, it may become necessary to cease the transport of United States Army troops and stores to France in order to meet the urgent requirements of the Allies as regards food and raw material.

Special situation.—The British and United States Army planning divisions decide to review the antisubmarine policy of the immediate future, bearing in mind that the northern barrage can not be moderately effective before July.

Required.—Estimate of the situation and decisions as to antisubmarine measures that should be taken now.

ANTISUBMARINE POLICY IN THE IMMEDIATE FUTURE—JOINT APPRECIATION BY THE
BRITISH AND AMERICAN PLANNING DIVISIONS.

SUMMARY OF CONTENTS.

Present policy.—Present submarine policy mainly a system of local trade protection. No concentrated attack on submarines except in the Dover area. Convoy escorts have the great advantage of getting in touch with the submarines, but their tactics are generally defensive, and they seldom kill. Lack of cooperation characteristic of the present system.

Suggested modifications.—Immediate policy, a concentrated offensive in North Sea consists combined with a modified system of local protection. Offensive patrol of the Fair Island Channel approaches. the crucial

question. The idea of inveigling the High Sea Fleet into a fleet action should be abandoned in favor of an antisubmarine blockade of the northern exit. The ship and organizing power of the Grand Fleet higher command and staff as well as a small proportion of its destroyers are essential to effective antisubmarine measures. The ocean escort destroyers and the coastal trawler patrols reduced by 30 and 50 per cent, respectively, to obtain the remainder of the required forces; probable results of these reductions. Offensive measures on a small scale recommended in certain areas to be brought about by a reorganization and consolidation of the coastal forces. Summarized conclusions.

PRESENT POLICY.

1. The forces directly employed fighting the submarine are to be found in three organizations: Convoy escort vessels and auxiliary patrol craft, the former escorting ships through the submarine zone, the latter being distributed round the coast.

2. These forces are given in the following table under the heading "escort vessels," "patrols," and "minesweeping."

[Sl.=Sloop. D1.=Modern destroyer, F. class and later. D2.=Older destroyer. P.=P. boat. S.=Submarine. T.=Trawler. W.=Whaler.]

| Nature of work. | Sl. | D1. | D2. | P. | S. | T. |
|----------------------------|-----|-----|-----|----|----|-----|
| Ocean escorts..... | 24 | 110 | 13 | | | |
| Cross channel escorts..... | | 1 | 12 | 31 | | 246 |
| Coastal escorts..... | | | 24 | | | |
| Total escorts..... | 24 | 111 | 36 | 44 | | 246 |
| Coastal patrols..... | | | | | | 248 |
| Submarine patrols..... | | | | | 38 | |
| Mine sweeping..... | | | | | | 410 |

In addition to the above, a force of about 21 trawlers is being prepared, fitted with fish hydrophones for submarine hunting.

¹Includes 38 United States Army destroyers at Queenstown and 6 destroyers at Granton for naval convoys. Does not include any of Harwich force, which nevertheless is employed as Dutch escorts.

3. In addition to the forces in foregoing table, there are the Grand Fleet at Harwich and Dover forces. The task allotted to the Grand Fleet and its auxiliary policy is to be ready to engage the High Sea Fleet at any time and anywhere in the North Sea.

4. The number of destroyers allocated to the Grand Fleet is only sufficient for battle purposes, and this policy, therefore, immobilizes them from any extensive continuous antisubmarine operations.

5. In the South, on the other hand, the primary task is to bar the Dover Straits and the primary function of the Dover and Harwich forces is to support the bar at Dover, therefore, is the only area in which any concentrated attack is being made on the submarine. The results are seen in Appendix 1, which shows the sound results of this policy.

6. It is clear that the vast majority of the antisubmarine forces in the vicinity of the United Kingdom are spread over a wide field, and are not concentrated to destroy submarines. We try to be strong everywhere, and are strong nowhere.

7. Part of the protective system, viz, the escort of convoys by fast vessels, however, the great advantage of forcing the submarine to attack in the vicinity of the escort, and gives it a chance of counter attack. In practice, however, only a few submarines are destroyed under these circumstances. This may be due to the fact that the forces on the spot are insufficient to bring about results.

8. It may also be due to faulty tactics, and in order that full advantage may be taken of these contacts, it appears essential that the escorting destroyers should discharge their defensive rôle and assume a vigorous offensive, which should not only include immediate depth charge attack, but also a persistent hunt during the remainder of the day by a large proportion of the escort. The question whether any destroyers should remain with the convoy would depend on the locality and probability of further attacks.

9. So far as trawlers are concerned, they have little offensive value, except in combination with faster vessels, and this emphasizes the necessity of coordinating the use of all craft and weapons. Each type possesses a certain degree of offensive power, but unless these powers are used in combination, successful results can not be expected.

ated. The deep mine field is dependent upon surface patrols. Hydrophone trawlers are practically useless without faster vessels, and aircraft greatly increase the hunting power of destroyers.

PROPOSED MODIFICATIONS TO PRESENT POLICY.

10. Instead of the above system of dispersion of force, it is urged that we should venturously aim at closing the northern exit by a great offensive effort in that area.

11. Decisive results will not be obtained until a very strong mine barrage is completed, and it would be inexpedient to abandon the local protection of trade until the hydrophone is more fully developed. It is urged, however, that a concentrated offensive effort, covering the reported track of submarines, be instituted in the northern area as soon as possible.

12. In February, about 70 per cent of the submarines operating outside the North Sea passed north about, and the number will tend to increase. Also, a certain number were probably damaged or defective on reaching this area, homeward bound.

13. At the present time, submarines passing north about confine themselves almost exclusively to the Fair Island Channel, the passages averaging one a day during February, 1918. The approximate times of passing through the channel are shown graphically in Appendix II.

14. An intensive patrol in this area could be quickly moved to another track, and could be flexible in its dispositions, enabling the utmost use to be made of any information available, which, at present, is certainly not utilized to its fullest extent.

15. It is most strongly urged that the success of the above policy rests on allotting certain definite antisubmarine functions to the Grand Fleet, for unless its present functions are modified, neither sufficient destroyers nor the necessary standard of organization will be forthcoming.

16. So long as the movements and dispositions of the Grand Fleet are based on the idea that the High Sea Fleet is likely to be inveigled into action by any other means than the defeat of the submarine, the most efficient part of the British Navy must play a comparatively minor part in defeating the enemy's primary line of attack. It must stand aside and leave the real battle to the militia of the sea—the trawlers, merchant marine, etc.

17. On the other hand, if the primary function of the Grand Fleet during the summer months is defined as the barrage of the northern exit to submarines, the High Sea Fleet will only become an object of immediate attack if it threatens the barrage.

18. The proposed policy amounts to exercising an intensive and immediate control over the northern area, while the control over the rest of the North Sea will be less immediate and less intensive. It involves certain minor risks such as exposure to bombardment, etc. These risks, which have been referred to in other papers, should be accepted and the necessary precautions taken. (Vide P. D. papers 049,37 and 053; also American P. D. Problem No. 2.)

19. By assembling the whole Grand Fleet at one base, and freeing it from the responsibility of dashing after the High Sea Fleet at short notice, except in support of antisubmarine operations, a flotilla of destroyers could probably be released for hunting submarines, but the commander in chief might allocate more or less according to circumstances.

20. In order to provide the remainder of the antisubmarine destroyers and patrol craft, it is proposed to reduce the escort destroyers, sloops and P. boats by approximately 30 per cent and the trawlers round the coast on patrol duties by about 50 per cent.

21. The withdrawal of trawlers from coastal patrol will probably not influence the shipping losses one way or the other. The effect of reducing the convoy destroyers can not be exactly foreseen, but no appreciable increase in sinkings is expected. The great initial success of the convoy system was due more to the concentration of shipping in a comparatively small space, and the consequent difficulty of locating it than to the protective power of the escort. This is illustrated by Appendix III, which shows how the enemy attempted to meet the convoy system by transferring his attack to the coastal and terminal areas, where his submarines would have a better chance of finding the convoys; also by the fact that, out of 57 attacks in which torpedoes were fired on ocean convoys between July, 1917, and March, 1918, in only two cases did the escort sight the submarine before the torpedoes were fired.

22. The proposed reduction in a destroyer escorts might be compensated by increasing the destroyers in the dangerous zones at the expense of the comparatively safe areas. For example, whilst the submarine campaign is mainly confined to the coastal areas of the United Kingdom, escorts to the westward of say 10° W. might be greatly reduced.

23. In addition to the proposed operations in the northern area, it is suggested yachts, older destroyers, and the remaining trawlers employed on coastal pa should carry out similar operations on the east coast, channel, and Irish Sea, in junction with drifters and mined nets, and that the coastal commands be consolidated into a few groups, so as to obtain greater flexibility and more economical employn of the available forces. The following grouping is suggested:

- (1) *Commander in chief*.—Grand Fleet; North Sea and antisubmarine operati from Firth of Forth north about to Hebrides, inclusive, with particular regard to blockade of the northern exit.
- (2) *East coast command*.—Coastal antisubmarine work from Firth of Forth to l mouth.
- (3) *Narrow-seas command*.—Yarmouth to Dover, inclusive, with particular reg to the blockade of Dover Straits.
- (4) *Channel command*.—English Channel (exclusive of Dover); including Fre Channel forces.
- (5) *Ireland command*.—Coasts of Ireland and approaches, including Irish Sea.
- (6) *Biscay command*.—French west coast.

Under the present system of scattered coastal commands it is most noticeable t submarines frequently operate for days in very limited areas without any large fo being brought to the spot, although they might be concentrated in a comparativ short time.

24. The foregoing may be summarized by saying that the principal factor in solution of the submarine problem is a new orientation of the functions of the Gr Fleet, and that if the commander in chief is allotted the primary task of prevent submarines passing north about and is freed from responsibilities which interfere t that duty, everything else will follow in due course. A consolidation and reorgan tion of the coastal commands are also required.

NOTE.—The British plans division has endeavored to reduce the proposals for intensive antisubmarine patrol in the north to a concrete form in Appendixes IV VI, VII, and VIII.

APPENDIX I.

[From information supplied by I. D. Section 25.]

Comparison of passage (submarines) through Dover Straits and North about.

No large submarines are believed to have passed through Dover Straits since 18th of February.

Capt. PRATT. The above figures are the London Planning Section and the note refers to the destroyers apart from the Grand Fl There is no attempt made to criticise this distribution. The Bri Navy knows its business. Nobody admires it and its magnificent work more than I do, but please note this—111 with fleet, 213

antisubmarine work. All this time we had only 9 to 10 left available on our own coast, and they were convoying ships when they could. Does it seem reasonable on this item to make out such a grave case against our Navy as "failure to give adequate support with means at our disposal during the first six months seriously and unnecessarily jeopardized the outcome of the whole war," and "I believe that this failure combined with the equally grave one of neglecting to prepare adequately during the few months previous, and the few months subsequent to our declaration of war, probably postponed victory four months." Isn't this straining a point to make a case against our Navy? I grant you that everything within reason should go over to Europe to combat the submarine, but at a pinch could not nine destroyers leave the Grand Fleet and join the antisubmarine forces working around the British Isles? Are we as black as Admiral Sims paints? I leave it to your judgment to decide. No, gentlemen: the balance of power to decide the submarine campaign never passed out of British hands during the critical months in question. We came in as soon as we could, but the submarine's fate was settled—although we did not know it at the time—before it was possible, within the limits of reason, for us to get into the game in force.

In this connection I wish to refer to Admiral Mayo's testimony, page 45.

The British destroyers at Queenstown were withdrawn after the arrival of our destroyers, notwithstanding that the area of operations there was repeatedly spoken of as being the critical one. If British destroyers had been kept there and the number increased, some of our destroyers could have been assigned with our battleship squadron and our mining force instead of depending on the British destroyers as pointed out by Admiral Sims. Furthermore, the experience of our destroyers in all phases of their work would have been beneficial and this certainly was desirable.

This evidence, coupled with the distribution of destroyers to Grand Fleet, is fairly conclusive proof that the British thought they held the balance of power in their own hands.

In April of 1917 (the month we entered) the total ships sunk by submarine were 423; tonnage loss, 846,863 tons. This was the month we entered the war, before our ships could get across and operate efficiently. Yet note this was the apex of the submarine campaign. In May, the losses were 320 ships; tonnage 551,778. In June the losses were 314 ships; tonnage 628,249; in July 240 ships, tonnage 502,048; in August 185 ships, tonnage 488,072. The following months throughout the war showed a steady decrease in tonnage losses; while in the first quarter of 1918 the building program we had inaugurated began to make its weight felt. No, gentlemen, as much as I would like to believe that we could have played a major rôle in putting down the submarine, and that therefore the major responsibility was ours, facts and figures tell a different story. The British themselves got it under control in May, 1917, before we could have gotten into the war, even with wings, and thereafter we were a very essential but only a contributing cause to the defeat of the submarine. I submit the data for the above statement. I will submit the tonnage figures. These are complete data, and there is a paper prepared by the British admiralty and furnished by the Allied Maritime Transport Committee, which gives you the whole status from the beginning of war and all the tonnage sunk.

The CHAIRMAN. Month by month?

Capt. PRATT. For the whole year; yes, sir; month by month. These papers are as follows:

HISTORICAL SECTION, March 16, 1919

Table showing the total number and gross tonnage of all allied and neutral ships, schooners, and fishing vessels sunk by submarines only.

[Does not include vessels sunk by cruisers, raiders, mines or other causes. Arranged to show, by month to month and year by year, from August, 1914, to November, 1918, but inclusive. Also showing same from August, 1914, to Nov. 30, 1917. Source: British Admiralty Reports on file in Historical Section.]

| Total. | 9,031,828 | 6,021,958 | 15,053,786 |

This figure includes 210,653 gross tonnage interned in enemy ports.
NOTE.—Tonnage lost by enemy action and October 31, 1918.
Total to November 11, 1918, British, 9,043,744; other nations, 6,024,117; for world, or 67,861.

Capt. PRATT. I am comparing the two drives, one a sea drive and the other a land drive. There are points of contact between the German submarine drive in the spring of 1917 and the land drive started in March, 1918. In April, 1917, we entered the war, and that month showed the greatest losses from submarine sinkings. This in itself is worthy of note, for it would indicate that the purpose of the campaign was not alone directed at the sinking of ships, but was also a campaign of propaganda directed at striking terror into the hearts of our people, in an effort to frustrate our troop movement across the Atlantic. Without the additional man power on the western front which the United States alone could furnish, there was danger of a stalemate and of an indecisive peace. The campaign opened against the United States in 1917, with the Germans using the same tactics and the same methods of propaganda that they had used earlier in the war, and also did later. Just as in March, 1918, the first land drive was the worst, so in April, 1917, the first submarine offensive was the worst and the succeeding months saw the submarine efforts spending themselves with receding force. The course run by the submarine campaign was not alone determined by the countertactics of the Allies, but was to a great degree influenced by the strategy of the great German General Staff. In the spring of 1918, the building curve of tonnage replacements crossed the curve of submarine sinkings. From that date it became merely a question of how long before our Army could cross the Atlantic and participate in the land operations of the western front. The final outcome of the war was certain, once the Allies held firm on land. Had it been possible to do so, it might not have been bad policy for the Germans to have launched this land drive, with the warning of the submarine effort, before the psychological effects following failure were felt.

I should like to submit another paper on the question of available ship tonnage, for the lack of protection of which we have been so severely criticized by Admiral Sims. If one were to rely entirely upon his statements, you would come to the conclusion that our so-called reprehensible delay had driven British shipping to such straits that they could neither take care of their own supply needs nor assist in handling our troops to an extent which promised failure for the allied land campaign. The following paper which I will read was submitted by Admiral Sims's plans section in London, January 10, 1918. This paper refers to the employment of British merchant ships as auxiliary cruisers in their naval service. [Reading:]

PLANNING SECTION, MEMORANDUM NO. 5, JANUARY 10, 1918, EMPLOYMENT OF
AUXILIARY CRUISERS.

One of the most urgent problems of the hour is the immediate increase of tonnage to augment the supply of food and munitions. Actual sinkings by submarines do not give a true indication of actual losses in carrying capacity incident to submarine warfare. To the sinkings must be added:

- (1) Vessels damaged by submarines.
- (2) Vessels damaged in collisions incident to convoy operations and to running without lights.
- (3) Losses in ton-miles per day due to convoy operations.
- (4) Delays in port due to inadequate port facilities.
- (5) Employment of merchant tonnage in naval operations.

All of these factors are cumulative and of such a serious nature as to demand the closest scrutiny to determine if it is not possible to reduce their unfavorable effect.

We have considered especially the employment of merchant tonnage as auxiliary cruisers. It is used for patrol and escort duties. It is in no sense at any time a reply

the submarine but rather an additional target in each instance. The principal usefulness of merchant vessels as auxiliary cruisers is protection of convoys against raiders. There are no known raiders at sea now. The present situation requires that no move in the game be lost and that some risk be accepted if we are to continue the war. We therefore recommend the immediate acceptance as a principle of action: "The maximum possible employment of all auxiliary cruisers in the ocean transport of food and munitions for the support of the war."

The following-named vessels of the Royal Navy appear to be employed in a manner not in harmony with its above principle:

¹ Approximate.

While we are being so severely criticized for failure to protect shipping, Admiral Sims's own plans section is criticizing the British Navy for improper allocation of their own shipping. This list does not include the *Aquitania* and *Mauretania* for which the War Department was bargaining, and which did not get actively into troop transporting until 1918. Economy in the use of shipping, proper allocation, speed in turn around, are all quite as important factors as protection, and the fate of our troop movement depended on all. It might be interesting for you to know, as reflecting on the efficiency of our Navy, that the troops carried by our transports average 7.19 men per 1,000 tons per day, while in the British ships they averaged 3.71 per 1,000 tons per day. Finally, it was not the submarine which decided this war or delayed victory, it was the land forces of the allies, side by side with our soldiers who won this war on land, as everybody knows. That has been stated a number of times.

These soldiers were transported during the critical spring and summer months of 1918 when the total world tonnage available was less than during the same critical months in 1917.

The world's output of shipping crossed the world's losses and began to show gains in the first quarter of 1918. To substantiate same I submit sheet "Transport and escort duty," which I have marked "P."

*Report by months of transport and escort duty performed by U. S. and foreign n
up to signing of the armistice.*

U. S. NAVAL FORCES OPERATING IN EUROPEAN WATERS,

U. S. S. "MELVILLE," FLAGSHIP.

30 GROSVENOR GARDENS, LONDON, S. W. J., June 28, 1918.

From: Force Commander.

To: Secretary of the Navy (Office of Naval Intelligence).

Subject: Forwarding of chart showing tonnage situation.

Inclosure: One.

1. The force commander is forwarding you herewith copy of a chart, which has been prepared by the intelligence section of the force commander's staff. The chart is designed to show both the tonnage situation and the German submarine situation from the beginning of the war to the 1st of June, 1918.

2. The top curve shows the amount of tonnage available for the use of the Allies month by month with indications as to the tonnage added and lost.

3. The second curve is designed to show the number of submarines available to the enemy each month with indications as to the number added and lost during the month. Attention is called to the fact that the information contained in this second curve is considered by the Admiralty to be highly secret.

W. M. KITTRIDGE.

By direction.

KEY TO CURVE CHART.

The following explanation will assist in reading the accompanying curve chart. Let the indicated sketch represent any section of the upper or lower curve.

Then for the lower curve, the line a-b indicates the number of submarines available for any given month; the distance b-c shows the number of submarines added during the month (where the smallest unit of the vertical scale represents one submarine).

the distance *c-d* shows the number lost during that month. The line *d-e* then states the resultant or new figure of submarines available for the following month. If the upper curve, the smallest unit of the vertical scale represents 50,000 gross

The line *a-b* indicates the total tonnage available to the Allies at the end of a month; the distance *b-c* shows the tonnage added during the month by construction and otherwise. The distance *c-d* would be the tonnage lost through enemy air and marine risk, leaving the line *d-e* as the total tonnage available for the following month.

spt. PRATT. The memorandum and attached diagram R give a graphic representation of the point where the building curve crossed the sinking curve.

Senator PITTMAN. What was that date, Captain?

Capt. PRATT. In the first months of 1918, somewhere in January to March, according to this. The figures vary a little bit from the curve.

(The diagram referred to is as follows:)

Diagram R.

MEMORANDUM FOR CAPT. PRATT—MERCHANT TONNAGE AND THE SUBMARINE.

In March last a memorandum was issued with relative tables on the merchant tonnage and submarine situation. The figures of this memorandum have been revised and brought up to date by the addition of the figures for the first 10 months of 1918.

These statements are attached, showing for the United Kingdom and for the world, the period August, 1914, to October, 1918:
Losses by enemy action and marine risk.
Merchant shipbuilding output.
Enemy tonnage captured and brought into service.
Since the issue of the previous memorandum, the output of the merchant tonnage of the world has overtaken the losses, and during the seven months, April to October, construction has exceeded losses by more than a million tons.
The rate of output of merchant tonnage in the United Kingdom has not yet overtaken the rate of British losses in any completed quarter; but if the tonnage purchased abroad is taken into account, the losses during the five months, June to October, are exceeded by the gains.
The following table summarizes the position of world tonnage on October 31:

| | Gross tons. |
|-----------------------------|--------------------|
| | 15, 053, 786 |
| New construction..... | 10, 849, 527 |
| Enemy tonnage captured..... | 2, 392, 675 |
| | <hr/> 13, 242, 202 |
| Net loss..... | 1, 811, 584 |

Source and date: British Admiralty; August, 1914, to December, 1917-1918.
Copied from pamphlet in O. N. I., Navy Department.

W. V. PRATT.

I present for the use of the committee, not to be reproduced, the War Department annual report of the Chief of Transportation Service for 1919, with special references to pages 7, 15, 28, 36, 73, to 87, inclusive, 118, 119, 120, 142, 149, 154, 160, and 161. Pages 73 and 74 to 87 are the most important to read. It shows where the original plan of the War Department to send a certain number of troops was changed. They submitted A, B, C, and D plans, and while there was a very grave question in their minds as to the ability to furnish the supply of tonnage necessary they did meet it, and the resources are there, and the number of tons I do not recollect, but it is set down there in the War Department's report, and they did meet the necessities both in troop transport ships and in supply ships for a very much increased program over what they had originally intended, so much so that we were able to increase the transportation during the very decisive months of the spring and summer of 1918. I have put slips in at those places in the book, and I submit the report for the use of the committee, those pages, 73 to 87, showing the increase in the War Department's program.

The grave charge made has not been substantiated by the mass data presented, and this imputation remains to-day as unproved the day it was made. Mr. Hoover, though admitting the gravity of the situation, refused to be drawn into the controversy or to make the charge against our Navy. The submarine campaign came like a disease, ran its course. None regret the loss of life and ships entailed more than we brother followers of the sea; but the statement made at our failure to contribute antisubmarine forces in quantity immediately upon our entry into this war jeopardized the ultimate success of the war can not be substantiated.

It must be evident that the Office of Operations could take no local view of this war. However important the viewpoint of its representative in England might be, the office could not be unduly influenced by local color. In his letter and in the testimony submitted Admiral Sims evidently regards the submarine campaign as

Capt. PRATT. In the first months of 1918, somewhere in January to March, according to this. The figures vary a little bit from the curve.

MEMORANDUM FOR CAPT. PRATT- MERCHANT TONNAGE AND THE SUBMARINE.

In March last a memorandum was issued with relative tables on the merchant tonnage and submarine situation. The figures of this memorandum have been revised and brought up to date by the addition of the figures for the first 10 months of 1918.

ys so much stress, was assured to us. For from the very beginning the sts. due principally to the preponderance of sea power vested in Great ad so assured the security of the sea that we were able to make our prepara- a comparative degree of security. Therefore, that prime essential, security being assured us, it no longer became part of our province to attempt to augment that preponderance, but it became our principal mission to throw e of our naval forces into those operations which would tend to strengthen s in which the Allies were weakest. In most previous wars, the dual mission wv had been, first, either to force offensive fleet action or to seek defensive i the best terms, and to build up reserves during the period while we were ag for the balance of sea power. Now, however, being relieved from the se of sea activities, this war took on for us a special character. The Navy's was principally one of protecting the line of sea communications and of up its reserves to the maximum required.

GENERAL POLICY.

ving definitely decided upon the character of the naval war, it became neces- outline our general policy. Briefly speaking, the naval mission of the Allies s, while maintaining control of the surface of the sea to make every effort to control of the subsurface of the sea. This mission applied to the fighting which we were to send to operate against the enemy. Likewise, the problem ling up our reserve forces, and of expanding the present organization to meet wth, was a matter which had to be carefully considered. It was then decided e present departmental organizations, if expended in an intensive but progres- anner, would meet all demands made upon it. It was further decided that unite of the fleet which could not be actively engaged against the enemy, be used to full capacity to develop the upbuilding of our reserves. In the ime, while so engaged, they should be placed where they could be moved or o best advantage for the allied cause.

ARMING OF OUR MERCHANT SHIPS.

Almost the first problem which faced the Navy was to secure, as far as possible, fety of our merchant fleet engaged in carrying food, munitions, and supplies to ilitary forces at the front. Germany, in attempting her submarine war, in the ning naturally chose to use her submarines in the way that would net her the and quickest returns. She, therefore, instead of using torpedoes attempted to by gunfire or by bombs all the merchant ships that fell in the path of her subma- . The department quickly realized that an answer to this, which would immedi- reduce submarine efficiency, and confine its activities to underwater activities, to arm our merchant ships. In so doing, we were forced to make use of the means and rather than do what we desired to do, but immediately plans went forward to ipate Germany's next move, which afterwards appeared in the form of her cruiser narines. The cruiser submarine was Germany's counter to the arming of our mer- it ships, but by the time those submarines were in operation the best of our chant fleet had been armed with a caliber of gun which was able to cope with the viest gun of the cruiser submarine. In the first part of this war some of the most resting encounters were those between our armed merchant ships and single my submarines, and there are cases on record where our armed guards have fought il the ship under them went down or they were forced to abandon the ship in nea.

SENDING OF DESTROYERS.

Immediately upon our entrance into the war, there was a demand for us to send troyers abroad. To some extent the request was sentimental, it being thought ecessary that our flag should be seen on the other side, and our destroyers being the ps most readily available for this purpose. Therefore, a division of destroyers was patched abroad and proceeded to base at Berehaven, Ireland, where they were n busily engaged in convoying ships and in antisubmarine operations. However, as soon discovered that these little hornets of the sea had a very distinct use apart m any sentimental value, and almost immediately we were requested to augment r force of destroyers abroad to the maximum. Admiral Sims, in his many reports the department, dwelt upon the extreme necessity of sending all antisubmarine ft abroad, and it was then that the department determined that every craft which s capable of being used in antisubmarine operations should be dispatched to the er side. This policy has been strictly adhered to throughout the war, despite the orts of the enemy, who later made every effort to divert us from strict adherence this rule by carrying submarine warfare to our shores.

the main issue to be considered. From them you ^{re assured to} the ^{preparation} of the sea. We admitted the gravity of the situation and made ^{the security}. SENDING CHASERS ABROAD.

6. The submarine chaser, a 110-foot boat, was created especially for the present war. The first object in building this type was that we should have a craft which might defend our own shores in case our other ships, more purely fighting craft, were dispatched to other waters. But it soon became evident that if these small craft could go abroad they should be sent abroad, and the same policy was adopted toward them as had been with our destroyers, namely, all that could possibly be spared should be sent abroad. It was late in the summer of 1917, and in the fall, before our chaser flotillas were constructed, organized, and trained sufficiently to be able to undertake the difficult task of getting these small craft across the water during the winter months. At first it was believed that they would have to be towed, and this was first attempted, but later they were sent over in flotillas under the protection of heavier escorting ships and with a mother ship to take care of their material needs. It became a matter of concern to get them across materially fit and with the personnel in fighting trim, so it was decided to route these ships via the Bermudas and the Azores. Having formulated the general plan of getting our chasers across, it was necessary to secure for them certain base facilities on the way over. To that end, negotiations were entered into with the Portuguese whereby we received from them the use of a temporary base at Ponta del Gada in the Azores. This base was built up to such an extent that we were able to care for the needs of our small and other craft that might require the use of a base while passing to and fro across the Atlantic.

SENDING OF BATTLESHIPS.

7. In order that there might be no question as to the preponderance of sea power in favor of the Allies, it was decided that a division of our dreadnought force should be sent abroad to cooperate with the Grand Fleet. This step was taken in the late fall of 1917, and Rear Admiral Rodman, in command of Division 9 of our fleet, was sent abroad and joined the naval forces operating in the North Sea. This division has been there ever since, has taken part in the various activities of the Grand Fleet, and, as one of the units of it, has stood ready to engage in any major operation in which this North Sea Fleet might be called upon to engage.

SENDING OF AIRCRAFT.

8. One of the problems which we were called upon to undertake was the establishment of various air stations on the coast of France and Ireland, from which, operating with seaplanes, dirigibles and kite balloons, we might operate offensively against the submarine and afford protection to the shipping converging in those waters. Likewise, steps were taken to provide the necessary aircraft to operate from these bases, as well as to provide for the necessary aircraft which would operate from our own shores, in case hostile submarine operations extended to our coast. There were, therefore, established abroad a matter of some 26 air stations from which our air forces operated, or were to operate from. Coincident with the establishment of these stations, the building of our aircraft was undertaken and as fast as these craft came along the same policy of sending them abroad, as had been adopted with our destroyers, was adopted with them.

SENDING OF SUBMARINES.

9. The principal antisubmarine efforts were at first carried on by surface craft, but it was later realized from the lessons learned by our Allies, that the submarine itself is the enemy of the submarine, especially when enemy submarines are forced to work upon the surface, as they sometimes are. Therefore, it was decided to send certain numbers of our submarines to the Azores, to keep that base clear and also to the coast of Ireland to operate from that general strategic area. In the late fall of 1917, and winter of 1918, two groups of our submarines were dispatched across the water and after a hard winter passage made their ports and have been operating from those localities ever since. Before our submarines had been dispatched abroad, the process of concentrating our reserves in these craft on our Atlantic coast, there to prepare for future contingencies, had been undertaken.

GENERAL POLICY IN REGARD TO SENDING SHIPS AND SUPPLIES.

10. Besides the specific types mentioned, there were various other smaller ships which could and were made available at the beginning of the war, such as yachts, Coast Guard ships, lighthouse craft, tugs, and tenders. These were armed and dispatched abroad as fast as they could be made ready for service. At the same time

The general policy went into effect of withdrawing from all parts of the world all of our fighting ships which could in any way aid in the present war and concentrated them either in European waters or on the Atlantic coast. Those dispatched to European waters engaged in antisubmarine operations. Those concentrated on the Atlantic coast stood ready to go abroad or engaged actively in convoy operations, which formed so great a part of the naval work in this war.

ESCORTING OF TROOP AND CARGO SHIPS—CONVOYS.

11. In the summer of 1917, the submarine problem having become acute and the losses to merchant ships great, it became necessary to definitely revise the methods of handling merchant shipping, in order that a greater degree of safety should be afforded. The solution of adopting the convoy of ships was first broached by the Admiralty. The problem to us was a new one, but they had had the experience of nearly four years ahead of them and finally decided that the method of convoys was the only solution to the problem. At the very beginning the department was not inclined to look with favor upon this solution. It slowed up shipping fully 20 per cent and the dangers of collision and the difficulties attendant upon carrying through his scheme successfully were very great. But in view of their greater experience the department yielded to the wishes of the Admiralty, and the convoy system of protection against the submarine was adopted. This system was applied to both cargo and troop ships and its success was almost immediately apparent. It consisted in gathering together certain numbers of vessels, sailing at regular intervals along established lanes, under the guard of heavier ships to protect against raiders, and of smaller destroyers to protect against submarines. This system went into effect with the first of our troop convoys which crossed in June, 1917, and has continued ever since to the day the armistice was signed. It is probably one of the operations which succeeded in breaking the back of the submarine operation, for it deprived the submarine of the benefit he derived from attacking individual unprotected ships and forced him to devote his efforts, for the most part, to ships which were protected by destroyers.

To engage with a convoy, the submarine was forced to enter the danger zone and frequently, it was he and not our ships which became the victim. In these convoy efforts, all of our destroyers, our armed cruisers, our smaller cruisers, and later the old battleships of our fleet have been engaged, and this work had been conducted winter and summer from June, 1917, until November, 1918. It has been a hard, grinding work, but that it was well done is attested to by the fact that some two million troops have been sent abroad, with not the loss of a single ship carrying troops under the protection of our forces on her eastbound voyage, due to the action of an enemy submarine. The history of the convoy operations in which our naval forces have taken part, due to which we have been able to so successfully transport such a large number of our military forces abroad, and so many supplies for the Army, is a chapter in itself. Suffice to say, it is probably our major operation in this war and will, in the future, stand as a monument to both the Army and the Navy, in what is probably the greatest troop transporting effort which has ever been conducted across the seas. The work is not finished. The problem of bringing our forces back is still a naval problem and it will be undertaken with the same spirit which characterized the convoy of our troops to Europe.

OPERATION OF OUR VARIOUS FORCES ABROAD.

12. This is, indeed, a chapter in itself and when, at a later period, it is possible to make a history out of numerous reports which have been submitted by the naval officers in charge of our various forces abroad, it will make a very interesting addition to the history of the United States Navy. Without, at this stage, attempting to go too much into detail, it is sufficient to say that our naval forces have operated in European water from the Mediterranean to the White Sea. At Corfu, Gibraltar, along the French Bay of Biscay ports, at the English Channel ports on the Irish coast, in the North Sea, at Mourmansk and Archangel, our naval forces have been stationed and have done creditable work. Their work will probably form the most interesting and exciting portion of the naval history of this war, and it is the work which has been most eagerly sought by all of the personnel, but owing to the character of the operations which our Navy has been called upon to take part in, it has been not possible for all of our naval forces, much as they desired it, to engage in operations at the front, and a large part of our work has been carried on quietly at the rear. This work, while not so brilliant, has still been necessary, and without it our forces at the front could not have carried on the successful campaign that they did.

THE WORK OF OUR NAVAL FORCES IN THE RESERVE.

13. Generally speaking, the work of the naval forces in reserve—that is, our fleet afloat—is divided into several classes. The mission of the battleship fleet became twofold. The dreadnaughts were drilled and trained to the minute, holding themselves as a reserve force, ready to be thrown into any strategic area where their presence might be needed, to reinforce any fighting force at the front, and to guard our lines of communications in the rear. This force was held strictly in readiness for battle. The mission of the older battleships became primarily one of training. In view of the enormous expansion in naval personnel, and the fact that our country had long ceased to produce seafaring men in great numbers, it became immediately necessary for the Navy to provide for the trained personnel to man not only its battleships but the auxiliaries and merchant ships, which it was later called upon to man. Our old battleship force, held in reserve for this purpose and operating from a strategically located base on the Atlantic coast, served as a nucleus for this training effort. It was a dull, grinding work, with none of the brilliancy attending the operations at the front; it was a work which required the utmost determination on the part of the naval personnel engaged in it, but it was one of the essential war works. And the men and officers engaged in this work are entitled to the same consideration as are their more fortunate brothers who took a more brilliant part. The cruiser force, while to an extent engaged in training, led a more active life, in that they were the first ships to go in to undertake the work of convoy, for in so far as the services of heavier ships were not absolutely needed in convoy work, it was unwise to put them in to an extent which would interfere with the training of personnel. It at all times was a balance between what had to be done and the policies the department desired to carry out. In this work of convoy there were engaged, not only the armored and heavier cruisers, but cruisers of all classes down to the very smallest.

ORGANIZATION OF OUR SHORE FORCES.

14. At the very outset it became apparent that should our purely naval forces be dispatched abroad, it would be necessary to organize along the lines which would give us an amount of naval protection for our own coast adequate to meet the forces likely to be sent against us. The chances of any raid on our coast by heavy surface craft could be discounted. It would not have been good policy for the German to have so scattered his efforts, and the amount of military good accomplished by the enemy in such an effort would have been nil. Such an attempt on the part of Germany was therefore discounted, and, moreover, we held a mobile force in reserve for that purpose quite sufficient to cope with any such effort. There was, however, the likelihood of the Central Powers attempting submarine efforts against us largely directed against our convoys, and possibly against our own coast. In order to afford adequate coastal protection, to develop an organization fitted to undertake the handling of the mining, sweeping, antisubmarine operations, the routing of merchant ships, and the convoy work, it was necessary to organize what were called naval districts.

These districts extended the entire stretch of our coast, both on the Atlantic and Pacific coasts, and the Great Lakes. The various military activities were centered in the commandant of the district, who had at his disposal the various Naval forces attached to that district. Associated with the more purely military operations were those which pertained to the repair, supply, and handling of the merchant ships which were either directly taken over in the Navy, or were operated by the Navy for the Army. These activities also came under the commandant of the naval districts. Within each district but set apart for more purely Naval work, were our navy yards. These yards were under the general supervision of the commandant of the district yet had a mission of their own which was entirely apart from any purely military operations. The enormous expansion of our repair facilities and the increasing demand made upon the yards rendered it necessary that these organizations should be disturbed as little as possible from continuing the very necessary industrial activities without which our Navy would not receive its proper share of material nourishment. Therefore, a clear line of demarkation was drawn between the purely industrial activities centering in our navy yards, and the military activities centered under the commandant. There was however, one section of our coast, or waters adjacent thereto, which had to be treated in a somewhat different manner. The problem of the Gulf and the Caribbean did not lend itself to the same manner of treatment as did our coast from Cape Cod to Key West. To forestall enemy submarine operations in the Gulf and Caribbean a force was established called the American Patrol Force, and its headquarters was in the vicinity of Key West. While the coastwise shipping could be adequately pro-

ed by routing close along our coast, the problem became a different one than it entered the Gulf and Caribbean areas, and it was this problem and the problem of antisubmarine operations which the American patrol detachment had to undertake. As was foreseen, the protection of the oil supplies from the Gulf to our coast and then abroad were quite vital to the success of the general campaign, and these supplies the patrol detachment were prepared to safeguard by adopting at the time the convoy system the instant they were threatened.

OPERATIONS DIRECTED AGAINST US.

5. The wisdom of making a clean-cut line of demarkation between the military and industrial activities on our coast and of foreseeing the character of hostile operations against which we should make preparation, was clearly shown when the enemy directed his operations against our coast. About the middle of May, 1918, the enemy evidently decided that he must make an effort to stop us from sending more military forces abroad, if possible to do so, or at least to so distract our efforts that we would be more concerned with protecting our own coast than we were in sending our forces abroad. About the 2d of June, evidences of the operations of enemy submarines began to appear. It had been determined before by the department that the logical military objective would be our troop and cargo convoys, but these were well guarded that the submarine evidently preferred not to engage with them, but devoted his efforts against our coastwise trade, and principally against our unarmed sailing vessels. Along with this campaign of destruction, which had no military value whatsoever, the enemy adopted the practice of strewing our coast with mines. This nature of his campaign had been anticipated and our sweepers had been actively engaged in clearing the channels through which our convoys regularly sail. It was natural, however, with the long expanse of sea coast which we had to protect that the enemy should succeed in laying detached mine fields which more than once proved destructive to our coastwise shipping. Up to the time that an enemy submarine appeared off our coast, it had been the practice to allow coastwise ships to sail direct, and as far as practicable lights were burned and the ordinary aids to navigation were kept going. Immediately upon their arrival on our coast, without the slightest degree slowing his efforts to diminish the rate of flow of troops and supplies abroad, all coastwise shipping was hauled in under the protection of our district forces and a series of ratings, escort, and air patrols were started, which rendered reasonably secure the vessels that plied up and down our coast. In order to further render our shores secure, and to force the submarine to operate further afield, there were immediately sent out against him our own submarines. Hunting groups of destroyers and chasers, which had been formed and were in readiness, were sent out against him. The net result was that very soon, from a military point of view, the hostile submarine's efforts became practically nil and he was forced to operate further afield, that is well out into the Atlantic, where his principal prey became the single unarmed ships returning home on their westbound voyages. This move on the part of the German submarine had been anticipated and for the greater part westbound ships rarely returned home singly, but usually in company with another craft which carried a gun sufficiently large to cope with that of the submarine. On the whole, the operations of the enemy submarine against our coast can be spoken of as merely one of the very minor incidents of the war, and had he chosen to carry his operations into the Gulf, or even to the coast of Brazil, he would have found that preparations had been made to anticipate them.

ORGANIZATION WITHIN THE DEPARTMENT ITSELF.

16. At the outstart it was necessary to take stock of the existing organizations to see whether they would best function along their present lines or whether it would be necessary to radically reorganize for war. It was found that the bureau organizations were capable of expansion within themselves, and all that was needed to make an efficient war machine was the closest cooperation between the various bureaus and of the various bureaus with the Office of Operations. A close-knit organization of this sort having the power of decision in its own hands, acting upon established policies and in touch with the active operations of our naval forces, appeared to be the most efficient. The weak point in such a link must necessarily be the cooperation between the various departments, and that the Office of Operations set itself out to remedy. There was consequently first of all established an efficient information and communication service, for it was realized that without these two prime essentials all of the various bureaus and operations itself would be groping in the dark. To that end the office of Naval Intelligence was enlarged and expanded until it reached a point of efficiency. Important work was handled immediately by the

cable and radio. There was established within the Office of Operations itself a organization wherein was gathered all information known as operating information so that it could be immediately accessible not only to the Office of Operations but to all bureaus, to the fleet, and to all other naval forces. However, efficiency could not have been realized had not Admiral Sims, commanding our European Fleet, fully realized the immense importance and the power that full information had for he established a similar system in London which was in complete touch with information on the other side and which he immediately routed to our central office. It thus became possible through the centralization of information and by means of the channels of communication which have been highly developed to largely centralize in the matter of detailed instructions to our forces, and thus to confer initiative to a large extent upon those leaders who were handling independent operations. It was thus possible to convey ideas and to give general instructions which would be thoroughly understood with a minimum of confusion.

The result is shown in the fact that during the entire course of the war there has been remarkably little confusion and very few changes from established plans. In addition to the service of information and communication it was necessary to establish an efficient inspection service of all sorts, particularly in relation to merchant shipping. This was efficiently handled under the direction of the Office of Naval Intelligence. It was also necessary to establish strict censorship over the press and radio and this was most efficiently handled by the Office of Naval Communications. It was likewise necessary that the public be properly informed as to the aims, motives, and operations of our Navy, and this was most efficiently done through the committee on publicity, who acted in the closest cooperation with the Office of Naval Operations.

COOPERATION WITH ALL DEPARTMENTS.

17. Not only was it necessary to secure the closest cooperation within our own department, but it was also most important that the closest harmony and accord should exist between the Navy Department and the various other departments of the Government, particularly with the State and War Departments. There were consequently detailed for this work special officers whose duties were to coordinate our activities with those of the various war organizations which had sprung up during the war. During the entire course of this war there has been the closest accord between the Office of Naval Operations and the State Department, War Department, Treasury Department, Department of Justice, Post Office Department, War Industries Board, War Trades Board, the Shipping Board, and the Alien Enemy Custodian. Even such organizations as the Fuel Administration, Food Administration, and the Red Cross came constantly in touch with the Navy Department. It was also necessary that the closest cooperation should be maintained between the various naval representatives of the different nations with whom we were united in fighting the war. During the entire course of the war there has been the closest harmony and cooperation between all of the various allied nations and ourselves. We have been furnished with all information that they themselves possess and we in turn furnished them with all the information we had. At the suggestion of the Navy Department the British commander in chief moved his headquarters to Washington where he was in constant touch with the Office of Operations. Had not this close liaison been established it would have been exceedingly difficult to have coordinated the various naval movements which had to be carried out jointly and which covered a great many fields of activity.

THE CHANGE IN THE NAVAL BUILDING PROGRAM.

18. As soon as we entered the war it became evident that unless we radically changed the naval building program then in process, it would be impossible to wage the most efficient war against the hostile submarine. Having determined that the war against the submarine, the service of supply, and the guarding of the lines of communications were our principal missions, it was immediately apparent that a switch in our naval program was needed. Therefore the department almost immediately decided that construction on our battleships, battle cruisers, and scouts, except in cases of ships nearly completed, should practically cease, and every effort was devoted to the construction of destroyers, chasers, and later of Eagle boats. In addition to the numbers of destroyers laid down, a new plan was prepared for additional destroyers, which was approved, and the work of construction continued until late in the summer of 1918, when, it being apparent that the hostile submarine was being controlled, it became evident that plans should be laid looking to a resumption of our former building program, in order that we might regain the ground lost in the previous year and a half.

THE NAVAL PART IN THE UPBUILDING OF OUR MERCHANT MARINE.

19. The Navy has always had very much at heart the upbuilding of a merchant marine, for from this source it must largely draw its supply of seafaring men needed to man our Naval craft. Therefore it very early became a matter of extreme importance to the Navy as to the best way in which this large merchant fleet which was being built by the Emergency Fleet Corporation, and which had been requisitioned by the Shipping Board, could be put to efficient war work. Plans were worked out in cooperation with the Shipping Board and with the Army whereby all of the ships turned over for Navy purposes, the cargo ships turned over to the War Department for supplying their Army abroad, and vessels of a certain size running through the war zone, could be manned by naval crews. Had the war been of a different character, it is possible that merchant shipping might not have been dislocated to the extent it was, for the character of the war was such that practically every commercial interest disappeared and all interests became military in their character. The needs of the Army alone, both in troops and supplies, were so great as to practically demand the turning over to their use, not only all of our own available tonnage, but such allied tonnage as could be chartered. It therefore appeared quite necessary that this tonnage operating for a military purpose should be under strict military control, which in so far as transporting across sea was concerned was a naval matter.

Above all, the character of the warfare waged by enemy submarines was such that at no time could the seas be called free and there was the constant menace to crew and cargo which required the highest technical skill to combat. For these reasons it became necessary to man those vessels that crossed the war zone with naval crews and in this matter the Shipping Board and War Department heartily concurred. The troop transports were, from the very beginning, manned with naval crews, as it was recognized that the lives of our soldiers could only, on the seas, be entrusted to those whose experience fitted them to give the maximum amount of safety. The wisdom of this policy is shown by the results, in the number of troops and cargo safely transported across the Atlantic. With the end of this war, another problem will face the Navy. If it is considered to be the policy that the feeding of the Central Powers and Russia still remain a Government problem, to be administered by us as a Nation, rather than as a commercial enterprise, then it seems probable that the feeding of these starving millions may have to be handled by the various Government organizations best fitted now to cope with the problem. If this be the case, the military problems of the past year and a half merely merge themselves into economic problems similar to those which we as a Nation have just successfully coped with. Then it may be that the Army organizations which have so successfully administered to our forces in France will be called upon to supply food for the starving millions. If that be so, then, it seems likely that our Navy will be called upon to man the ships used by the Army for this purpose and while the process of demobilization will go on, in so far as our lesser purely military units are concerned, it may be necessary, for a number of years to come, for the Navy to take a very active part in the administration of our merchant marine.

THE WORK OF THE PLANNING SECTIONS.

20. It was early realized that no naval operations or successful campaign against the enemy could be inaugurated and systematically carried out without the aid of officers specially trained to do the planning. Apart from the major plans of campaign, which it has been the province of the General Board to formulate, there was constantly occurring opportunities for local operations, and even for operations of a major character which it is very necessary that officers who are not engrossed with administrative details should give their attention to. At first the department was swamped with a mass of administrative detail. This was quite natural and was inevitably due to the sudden transition from a peace to a war footing. But eventually it became possible to pick out and assign certain officers specially qualified whose mission it was to devote themselves to the work of planning.

In the late fall of 1917 it became possible to augment Admiral Sims' staff with officers who had no other duties except to work upon various plans. A similar planning section was also formed in the Office of Naval Operations. Both of these planning sections were in the closest touch with the Admiralty Planning Section and jointly considered the various subjects which arose in the course of the war. In cooperation with the General Board and with the various bureaus, such plans as the northern barrage plan, the Adriatic mine barrage, the Aegean mine barrage, the plan for operating our great guns in Europe, the northern bombing project, the general policy of our aviation efforts, the systematic hunting of submarines, and numerous other plans were

worked out. The department had at all times a good working knowledge of the best things to do in the emergencies, and in addition it was also able to some extent forecast the trend of enemy operations, and to a degree to plan a counter. Without such organizations it is very doubtful if a clean-cut, well-thought-out plan of campaign can be conducted, and the value of these planning sections has shown itself many times over. Had the war continued longer their value would have been doubly increased. The existence of these two organizations working in close harmony with each other, one across the water and one here, is making far simpler the process of a systematic demobilization.

ACTIVITIES AND POLICY ON OTHER STATIONS.

21. The process of reduction of forces on our stations, except the North Atlantic and in the war zone, went into effect immediately at the beginning of the war. There were, however, reasons apart from military reasons, where it was not desirable to strip the Asiatic, South Atlantic, and other stations of all the vessels that were there. On the Pacific coast there was left a bare modicum of ships to attend to purely local needs. In South America, under Admiral Caperton, there were at least four armored cruisers stationed there at the time when a few hostile raiders were at large. But the danger from raiders having passed and the convoy needs growing greater, the admiral on this station was left with only sufficient force to enable him to successfully carry out his mission, which was largely one of cooperation with the Brazilians. This he most successfully did. At the Brazilian war college to-day there are representative United States naval officers, who are closely in touch with the activities of this college, and there are other officers who are working in harmony with the Brazilians and establishing friendly relations between their Navy and ours.

The cruises of our ships in the South Atlantic took them as far afield as Valparaiso on the west coast and to Liberia on the coast of Africa. In Asiatic waters the center of effort naturally was around the Siberian ports. Admiral Knight, on the *Brooklyn*, has been a student of the situation there and has kept the department constantly informed of the varying changes in the Siberian situation. At Mourmansk, in Russia, one of our ships was dispatched to act in cooperation with the Allies, and was instructed to particularly carry out the policies of the State Department. Since the armistice had been signed the *Scorpion*, which was interned at Constantinople, has been recommissioned and is now showing our flag in the Dardanelles and Black Sea. In the Adriatic one of our cruisers, with several destroyers, has been recently dispatched in order that our forces may be represented in the activities taking place within that area. In Canada we were requested to establish seaplane stations to aid in hunting the submarine, and this was done.

NAVAL POLICY TOWARD THOSE ALLIES WITH WHOM WE WERE ASSOCIATED.

22. It was realized that one of the reasons for causing this war to drag along as it did for a number of years was the lack of close cooperation between the Allies engaged in it fighting against the United Central Powers. Therefore, our position being particularly unique one, and it being evident to all concerned that the United States could have no ulterior motives, it was fitting that the policy of the Navy Department toward those with whom it was associated should be one of the utmost frankness and straight dealing. We never expected to receive anything but the most open and fair treatment and in return we gave the same. It is a pleasure to state that so thoroughly have the Allies responded to our attitude, or even anticipated it, that there has never arisen an occasion where we felt that there existed the slightest ulterior motive. This office has received at all times fully and freely all information, no matter how secret its character, which has aided us in our planning and in our operations particularly. We are especially indebted to the free access which we have had to the information obtained by the British Admiralty intelligence service.

RESPECT FOR INTERNATIONAL LAW.

23. Since it is the province of the Office of Operations in outlining any campaign of war not only to take cognizance of immediate operations but to determine upon the policies to be carried out and to initiate plans and campaigns, it was of importance that the character of warfare which we waged should at the end of the war be open to inspection. For that reason, in every operation that was planned the tenets of international law were strictly regarded and the motto was adopted which was scrupulously adhered to, not "that the end justified the means" but that "the end must be justified by the means."

24. The Office of Operations takes pleasure in expressing its deep appreciation to the various branches of the Government, of the naval shore establishment, and of the naval forces afloat, without whose close cooperation and assistance it could in no wise have accomplished any of the problems with which it was confronted.

W. V. PRATT,
Acting Chief of Naval Operations.

I have here the report of Admiral Mayo to the Navy Department of requests for assistance to the United States following the international naval conference in London, September 4 and 5, 1917, with notes made on the original in my handwriting. I submit that to show that when Admiral Mayo made his report, exactly what we were doing with it and the steps we were taking. He went over, you will remember, in August, 1917, and so it seemed essential that this should go in to show that we were not asleep, and that we were trying to do the things he asked for, and on looking over the original letter files I found this. We were very busy in those days, and there was not very much time for writing, and we would often take the original letter and write upon it, saying "Yes; doing it," or something of that sort; so that I submit this original copy of that report of Admiral Mayo, showing what was being done in certain cases.

The CHAIRMAN. With your notes on it?

Capt. PRATT. Yes.

The CHAIRMAN. So that the notes can go in as well as the report?

Capt. PRATT. Yes, sir. This report is as follows:

REPORT OF ADMIRAL MAYO TO THE NAVY DEPARTMENT OF REQUEST FOR ASSISTANCE FROM THE UNITED STATES FOLLOWING INTERNATIONAL NAVAL CONFERENCE IN LONDON, SEPTEMBER 4 AND 5, 1917.

[Notes (printed in brackets) made on original in handwriting of Capt. Pratt.]

PASSAGE, LIVERPOOL TO NEW YORK,
S. S. *St. Louis*, October 11, 1917.

File 8012, confidential.

From: Commander in Chief, United States Atlantic Fleet.

To: Secretary of the Navy (Operations).

Subject: Specific requests for assistance from the several allied powers.

References: (a) Report of international naval conference in London on September 4 and 5, 1917—extracts; (b) memorandum from first sea lord of British Admiralty, dated September 22, 1917; (c) memorandum of requests from France; (d) memorandum of requests from Italy; (e) memorandum of requests from Russia.

1. The following summary of specific requests for assistance from the United States made by the several allied powers is assembled from the references and from notes made in interviews with Government representatives.

2. It is recommended that immediate and careful consideration be given to these requests and that decision or views in the premises be communicated to the several Governments concerned as soon as possible, in order that the necessary arrangements for cooperation and coordination of assistance to be rendered may be made, as in practically all cases the time element is of very great importance.

3. Not only should there be the least possible delay in replying to the several requests in order that the Governments concerned may plan accordingly, but where material assistance is involved, care should be taken to concentrate effort on the production of material already found even fairly satisfactory for the purpose intended, rather than to institute research and experimental work for development of new apparatus, or for the improvement of existing apparatus, thus causing delays in production which would operate to markedly reduce, and perhaps even to nullify, the value of the assistance rendered.

4. The summary of requests is arranged as follows: (a) Requests made during international naval conference in London September 4 and 5, 1917, inclosure A; (b) requests made by Great Britain, inclosure B; (c) requests made by France, inclosure C; (d) requests made by Italy, inclosure D; (e) requests made by Russia, inclosure E.

5. The commander in chief has made no written recommendation regarding these several requests but is prepared to discuss them and to explain the points that were presented in connection with them when they were made.

H. T. MA-

There has been established in European waters a destroyer force under the command of Vice Admiral W. S. Sims, and 28 destroyers have been despatched abroad for service, together with 2 destroyer tenders. Two supply ships, under destroyer command, have been despatched to France, carrying cargoes of much needed material for that country.

By agreement with the allied powers definite areas of patrol in the North Atlantic and off the east coast of Brazil have been taken over by the United States Navy; a scout force has been despatched to cover the area assigned our forces in the North Atlantic, under the command of Admiral W. B. Caperton.

There has been established in the Pacific a patrol of the Pacific Coast, including Mexico and Central America as far south as Panama Canal, under Rear Admiral W. F. Fullam.

There has been organized a force of small craft designated for patrol service in waters adjacent to the coast of France, and Captain W. B. Fletcher has been placed in command of the first contingent of this force, which will complete its fitting out in a few days and start for its field of operations.

There has been organized a system of convoy service under general charge of Rear Admiral Albert Gleaves, in readiness for the convoy of any troops which may be despatched to France.

In addition to the foregoing, armed guards have been or are in process of being placed on all vessels, about 150 in number, plying between the United States and Europe, and the Atlantic Fleet has been given the duty of training the crews for the armed guards of merchantmen and transports.

The organization of the several forces, the regulations for convoy service, the instructions for the operation of merchant vessels supplied with armed guards, and the instructions for United States merchant vessels have all been prepared and issued by the planning section of the office of operations.

A board, of which Capt. Pratt of the office of operations is chairman, has been appointed to consider plans and devices connected with submarine warfare, and holds an almost daily session and conference with the research committee of the Joint Committee on National Defense.

Definite and effective steps have been taken toward the organization of measures to take over the control of the routing of all merchant vessels leaving United States ports. At present this function is being exercised by representatives of the British Admiralty stationed in our ports.

Preparation and distribution of various publications and ciphers for use in communication between merchant vessels and men-of-war of the United States and of the allied powers is well advanced. The communication office has been greatly enlarged to meet the demands of the increased work brought about by the state of war, the taking over of all radio service, and the establishment of the censorship over cables. It is contemplated to establish a service of officer-messengers for the distribution of secret and confidential publications, and ciphers.

NAVAL DISTRICTS.

The work of the naval districts has been extremely active, especially in districts 1 to 5 inclusive, because of their greater strategic importance and because of the trans-Atlantic traffic passing to and from the ports within their limits. The sixth, seventh, and eighth districts are filling up their organization, but are not developed to the same extent. Those districts on the Pacific coast and in Hawaii have not yet been fully organized. Defensive sea areas have been declared and have been enforced in Boston, Newport, New York, Philadelphia, Cape Henry, Hampton Roads, and Charleston, as fast as the number of patrol boats become available efficiently to exercise control over the areas. Other areas will be enforced as the organizations grow.

Six hundred and twelve small vessels have been inspected and found suitable for naval use; 152 have been taken into the naval service and assigned to scout service and as mine sweepers; 138 have been ordered taken over but have not yet been delivered. Those accepted are now actively at work patrolling and mine sweeping or are being fitted out as rapidly as possible for work. All the small craft acquired by the naval district commandants have been manned by enrollment of Naval Reserve men within the districts, and the personnel by active employment are rapidly becoming trained and accustomed to the line of work which the defense of the district demands. Mine sweeping is being carried out at Boston, New York, Delaware Bay, and Chesapeake.

The obligations under the emergency appropriation of \$115,000,000 incurred in equipping the naval districts is indicated in the attached table.

MADE BY GREAT BRITAIN—FURTHER ASSISTANCE DESIRED FROM THE UNITED STATES.

[Memorandum from first sea lord.]

Further assistance desired from the United States from available forces or as follows:

Coal-burning battleships of the dreadnought type to replace three or four dreadnought battleships which it is desired to send to foreign waters to replace battleships which are being paid off for want of personnel. [Yes.]

Increase in the number of destroyers, in order to enlarge the convoy system and give better protection for each convoy. [Yes; when we get them.]

Increase in the number of convoy cruisers for the same reason. [We cannot have not the ships available.]

Increase in the number of patrol craft, tugs, etc., for antisubmarine work. [Yes.]

Speedy building of merchant ships. [Doing it.]

Supply of a large number of mines for the proposed barrage between Scotland and Norway, and assistance toward laying them by the provision of United States laying vessels. [Yes; doing it, but the vessels to lay them should be sent now.]

As the increase in the number of destroyers during the war has forced the older capital ships to provide trained personnel for the light cruisers, destroyers, and destroyers. This policy must still continue, as officers and crews are needed during the next 18 months for the 19 light cruisers, 12 flotilla leaders, and destroyers now in various stages of construction.

The United States Government see fit to send over four coal-burning dreadnoughts would be attached to the Grand Fleet and form an integral portion of it together as a division of a battle squadron.

United States destroyers are more suitable for convoy work on the western coast of Great Britain than British destroyers, owing to their size and greater endurance. Any increase possible in this direction would enable more British destroyers to be used in the North Sea to operate offensively against enemy submarines.

Increase in the number of convoy cruisers would enable the number of convoys to be increased, or, alternatively, the number of merchant ships in each convoy to be increased and better control and protection be assured.

The proposed barrage of mines between Scotland and Norway will entail the employment of large numbers of patrol vessels. Any assistance from the United States will be most welcome, either to cooperate in patrolling the barrage, or, alternatively, to release British patrol vessels for this purpose.

[Staff D. C. N. S., September 22, 1917.]

With regard to mines: (a) It is considered essential that mines used in a patrol craft are numerous should become inoperative upon breaking their moorings.

The British Admiralty desires to know what type of sinker can be used with the mines.

[Situation: (a) The situation with regard to fuel oil is still unsatisfactory. Amount on hand for naval use is approximately 600,000 tons. Of this possibly as 150,000 tons will not be available at the particular point where it is required, leaving a real available supply of approximately 450,000 tons. [Foley; under consideration.]

Normal monthly consumption under the present conditions of operation (including immobilized) is 225,000 tons. [We need three more tankers now.]

Amount on hand available is therefore approximately two months' supply. Greatest efficiency in oil supply can only be obtained by pooling the tonnage of oil companies and controlling their sailings by a joint committee of the United States and Great Britain.

REQUESTS MADE BY FRANCE.

At the time the commander in chief was in France conferences were held with Gen. Pershing, United States Army, Vice Admiral DuBon, chief of staff of the Navy, and with officers of the United States Navy on duty in France.

On suggestion of Lord Derby and Gen. Murry, Gen. Pershing had already suggested to the United States suggesting that he proceed to London for a conference with Gen. Pershing and Admiral Mayo, to fully consider all of the demands which will be required for shipping in order to supply the United States Army and the necessities of the campaign. He had received an answer to the effect that the President did

There has been established in European waters a destroyer force under the command of Vice Admiral W. S. Sims, and 28 destroyers have been despatched abroad for service, together with 2 destroyer tenders. Two supply ships, under destroyer command, have been despatched to France, carrying cargoes of much needed material for that country.

By agreement with the allied powers definite areas of patrol in the North Atlantic and off the east coast of Brazil have been taken over by the United States Navy and a scout force has been despatched to cover the area assigned our forces in the North Atlantic, under the command of Admiral W. B. Caperton.

There has been established in the Pacific a patrol of the Pacific Coast, including Mexico and Central America as far south as Panama Canal, under Rear Admiral W. F. Fullam.

There has been organized a force of small craft designated for patrol service in waters adjacent to the coast of France, and Captain W. B. Fletcher has been placed in command of the first contingent of this force, which will complete its fitting out in a few days and start for its field of operations.

There has been organized a system of convoy service under general charge of Rear Admiral Albert Gleaves, in readiness for the convoy of any troops which may be despatched to France.

In addition to the foregoing, armed guards have been or are in process of being placed on all vessels, about 150 in number, plying between the United States and Europe, and the Atlantic Fleet has been given the duty of training the crews for the armed guards of merchantmen and transports.

The organization of the several forces, the regulations for convoy service, the instructions for the operation of merchant vessels supplied with armed guards, and similar instructions for United States merchant vessels have all been prepared and issued by the planning section of the office of operations.

A board, of which Capt. Pratt of the office of operations is chairman, has been appointed to consider plans and devices connected with submarine warfare, and it is in almost daily session and conference with the research committee of the Council of National Defense.

Definite and effective steps have been taken toward the organization of machinery to take over the control of the routing of all merchant vessels leaving United States ports. At present this function is being exercised by representatives of the British Admiralty stationed in our ports.

Preparation and distribution of various publications and ciphers for use in communication between merchant vessels and men-of-war of the United States and of the allied powers is well advanced. The communication office has been greatly enlarged to meet the demands of the increased work brought about by the state of war, the taking over of all radio service, and the establishment of the censorship over cables. It is contemplated to establish a service of officer-messengers for the distribution of secret orders, confidential publications, and ciphers.

NAVAL DISTRICTS.

The work of the naval districts has been extremely active, especially in districts 1 to 5 inclusive, because of their greater strategic importance and because of the great trans-Atlantic traffic passing to and from the ports within their limits. The sixth, seventh, and eighth districts are filling up their organization, but are not developed to the same extent. Those districts on the Pacific coast and in Hawaii have not yet been fully organized. Defensive sea areas have been declared and have been enforced in Boston, Newport, New York, Philadelphia, Cape Henry, Hampton Roads and Charleston, as fast as the number of patrol boats become available efficiently to enforce control over the areas. Other areas will be enforced as the organizations grow.

Six hundred and twelve small vessels have been inspected and found suitable for naval use; 152 have been taken into the naval service and assigned to scout patrol service and as mine sweepers; 138 have been ordered taken over but have not yet been delivered. Those accepted are now actively at work patrolling and mine sweeping or are being fitted out as rapidly as possible for work. All the small craft acquired by the naval district commandants have been manned by enrollment of Naval Reserves within the districts, and the personnel by active employment are rapidly being trained and accustomed to the line of work which the defense of the district demands. Mine sweeping is being carried out at Boston, New York, Delaware Bay, and in the Chesapeake.

The obligations under the emergency appropriation of \$115,000,000 incurred in equipping the naval districts is indicated in the attached table.

OPERATIONS ON SHORE.

The naval government of the Virgin Islands of the United States has been established under the governorship of Rear Admiral J. H. Oliver, and steps have been taken to provide at least a partial land defense of the islands by mounting eight 5-inch guns distributed between the islands of St. Thomas and St. Croix. Steps have been taken looking in view the establishment of quarantine services, medical research services, and agricultural services in the islands.

Affairs in the island of Haiti, involving the peace of the Republics of Santo Domingo and Haiti, have progressed satisfactorily, and the authority of the established governments of these Republics has been maintained. In the two Republics there are now forces of marines aggregating 2,000. In Santo Domingo a guardo nacional under the military government and under the direction of United States marines has been formed and is undergoing a course of training, while in the island of Haiti the gendarmerie is reported to be in a very efficient condition. A small coast-guard service has been established in Haiti and vessels repaired in ports of the United States assigned to this service have recently been delivered under United States naval escort. In addition, there have been employed in the disturbed districts of Cuba, caused by the recent revolution in that country, a varying force of marines for the protection of American interests there. There are at present about 450 marines maintained in the island. An information service throughout the island has been organized.

We have maintained constantly in Mexican ports and along the coast a patrol by our vessels, giving especial interest to the port of Tampico, in the vicinity of which the vast oil fields constituting a large and important source of the world's supply of oil. From two to four vessels have been maintained continuously at this port.

MATERIAL.

The vast work of equipping and repairing the fleet has brought upon our various navy yards and shore establishments demands which have taxed their utmost capacity. Not only has it been necessary to complete the overhaul and repairs of our regular naval vessels but repairs to the seized German merchant vessels and the fitting out and equipping of ships taken over for service have multiplied the work required to be done.

Repair work on the battleships left unfinished before the movement of the fleet south has been taken up and practically all naval vessels have been made materially ready and put in service. The fitting out of vessels for distant service is nearly completed, 15 German ships badly damaged by their crews before seizure by this Government are being fitted out for naval purposes, and 8 German ships are being repaired for the Shipping Board.

AERONAUTICS.

The naval aeronautic program was considerably accelerated upon the severance of diplomatic relations February 3, 1917, and the present program of naval aeronautic expansion may be considered to have begun on that date.

Enrollments in the Naval Reserve Flying Corps were begun under definite standards supplied to commandants of the various naval districts, and arrangements for accelerating the training of personnel at Pensacola and for establishing various other schools of training were made. There are five such schools now in operation.

Contracts were authorized for such aircraft as could be turned out for the Navy by July 1, including in this number 16 coastal dirigibles, and contracts are being made for additional aircraft as fast as they can be accepted by the manufacturers. Two hundred and eight aircraft have been ordered but not yet delivered. There are under construction at Pensacola 12 temporary hangars, a dirigible shed, and a large hydrogen plant.

In accordance with the recommendation of the Joint Army and Navy Board on Aeronautic Cognizance, sites for coastal air stations were examined and selected, and complete plans for the development of such stations were drawn up. Money for the acquisition of these stations is not available, but is included in an appropriation now pending. One site, however, has been obtained through permission of the use of land from the city of New York, and the construction of an air station there is now under way.

An allotment from the emergency fund of \$3,000,000 was made to aeronautics. Of this sum \$1,025,000 has been obligated and the expenditure of a further sum for the purchase of air craft equipment costing approximately \$1,244,000 has been authorized. The balance of approximately \$731,000 remains available.

There has been established in European waters a destroyer force under the command of Vice Admiral W. S. Sims, and 28 destroyers have been despatched abroad for service, together with 2 destroyer tenders. Two supply ships, under destroyer command, have been despatched to France, carrying cargoes of much needed material for the country.

By agreement with the allied powers definite areas of patrol in the North Atlantic and off the east coast of Brazil have been taken over by the United States Navy and a scout force has been despatched to cover the area assigned our forces in the South Atlantic, under the command of Admiral W. B. Caperton.

There has been established in the Pacific a patrol of the Pacific Coast, including Mexico and Central America as far south as Panama Canal, under Rear Admiral W. F. Fullam.

There has been organized a force of small craft designated for patrol service in waters adjacent to the coast of France, and Captain W. B. Fletcher has been placed in command of the first contingent of this force, which will complete its fitting out in a few days and start for its field of operations.

There has been organized a system of convoy service under general charge of Rear Admiral Albert Gleaves, in readiness for the convoy of any troops which may be despatched to France.

In addition to the foregoing, armed guards have been or are in process of being placed on all vessels, about 150 in number, plying between the United States and Europe, and the Atlantic Fleet has been given the duty of training the crews for the armed guards of merchantmen and transports.

The organization of the several forces, the regulations for convoy service, the instructions for the operation of merchant vessels supplied with armed guards, and the instructions for United States merchant vessels have all been prepared and issued by the planning section of the office of operations.

| Vessels taken over by special board..... | 1,4 |
| Total..... | 7,9 |

I have here a personal letter, or a letter written in a personal by me dated July 2, 1917, to Admiral Sims. I got this out of official files of the department. I found it when I came back. It is a letter which expresses very clearly our attitude at that time the way we felt in the matter. I shall read this letter, and this is the original, straight from the files of the department.

The CHAIRMAN. Who wrote that letter?

Capt. PRATT. I did. It was made official by having Admiral Sims's sanction to it. The letter is as follows. [Reading:]

JULY 2, 1917

DEAR SIMS: Will try to get a letter off to the cheer-up admiral.

Did you see the article of Reuter Dahl in the Saturday Evening Post? As a matter of policy I shall try to get you off a news budget from time to time, in order to keep you in touch with the situation. Don't get down on your luck—I know you won't. You are the man for the job and constantly we over here hear the nice news about you. If the cables are not answered on time, cheer up. We will do our best, rotten as that is. Here goes for a spiel on policy as I see it.

OUR POLICY IN BUILDING.

Through efforts on the part of Schofield and all of us, crystallized into definite plans we have presented a clean cut outline of the policy which we deem is absolutely necessary to follow if this affair is to be brought to a successful conclusion.

Briefly speaking, it is this. To push the immediate construction of destroyers, submarines, and merchant ships, not only push what is contracted for but to devote building energy to those ends and to the building up of the ship-producing facilities.

To carry out the design above outlined, we have recommended the abandonment of the present of all dreadnought battle cruiser and scout cruisers, except the dreadnoughts almost completed.

To further these plans the Navy is cooperating to its utmost with Gen. Goethals, as the head of the merchant-ship building program, is a tower of strength. He has asked for a naval board of advisors and it has been appointed. Admiral Benson is strong for it and every effort of his will be directed toward getting the Secretary to make a decision.

We all feel that this must be done, though we realize that such a policy may leave us with our guard down in the case of future complications. There, however, is where we must come in, and we must trust to your good offices, in your diplomatic way, to make the situation safe for the future. That is the happy solution, and it is a solution which I hope from the bottom of my heart may be accomplished for the future well-being of the entire Anglo-Saxon race. Whatever might be the outcome, even were we forced to result, England's fleet must never go elsewhere except to join our own, and portions of it as we might need in future contingencies ought to be at our disposal. There must be no mistake about that. But willy-nilly, we of us here who may have a iota of say in directing our policies are turning every effort in the direction of a successful solution of this problem, leaving the future to take care of itself.

MINES.

In one of your earlier cables you expressed the desire that we should undertake the construction of great numbers of mines. Later, you cabled our mine was so satisfactory and that the Admiralty did not desire it. You are by now in receipt of our later cable requesting a definite statement of policy. We, as I understand, stand ready to undertake the construction of very excellent mines in great quantities without interfering with our other efforts. The Admiralty expert, Commander (I think), has, so I am told, expressed his satisfaction with the mine. Personally I think the mine will play a great part in the ultimate solution of the war, and mine class I put the torpedo, the depth bomb, and the aerial bomb (the great all) as well as the mine true. About 30,000 tons of steel are being held up on this situation pending an ultimate decision.

STRATEGIC FIGHTING AREAS.

The North Sea, (2) the Adriatic, (3) other areas. It has always seemed to me, and in this I am not alone, that areas (1) and (2) were offensive areas, and that, outside of these, the (3) class, other areas, were largely defensive in a broad strategic sense. England and the Allies have tried everything in (1) and (2) from the fleet to a patrol on the surface and, as you said in your cables, a limited mines operation. If I may be pardoned for saying so, and though she has learned through hard experience, I think the cart has been put ahead of the horse. Two years ago when the fleet contained the German High Sea Fleet, everyone said Mahan was vindicated, the silent pressure of the fleet was to save the situation. That is just as true to-day as it was then—the silent pressure of the fleet is there, but it is the conception of the strategic area in which it must operate to be effective, that is gumming the game. It has been borne home to me more and more when I compare the similar attitude of mind which exists in our own fleet. To be effective, the powers that control the movements of our fleet decided that it must come north on our own coast. There were several of us who said "No" to that proposition, "the best results will be gained by sending it to the Pacific" or where it can drill fit to the minute at sea. The other side thought that a reasonable proximity to the scene of possible action was the first requisite. That I am trying to drive at is this—the fleet, Admiralty's or ours, is a strategic proposition. Its effect will be felt even if it does not attempt the physical control of the North Sea with its component members. If it in any way hampers the tactical facilities of those fighting agencies which can do a better local work in that region, then the local agencies must not be sacrificed to the fleet, but the fleet must adjust itself to the immediate need. The immediate need—the mission—is the strongest possible offensive in the North Sea and the Adriatic against the submarine. As it seems to be working out, the strongest offensive agency capable of effectively working against the submarine is the mine in some form—whether it be projected from a submarine, a destroyer, an aircraft, or whether it be planted in the water. Therefore when the Admiralty decides that certain areas can not be mined because it will interfere with the operation of the High Sea Fleet, I say the Admiralty, or whoever makes the decision, decides wrong, and I am going to stick to it like a stubborn mule. The North Sea and the Adriatic must be offensive mine areas, and the tactical disposition of the forces concerned must be such that the most mobility of action along the lines indicated be gained. With the barrage of mines by the thousands, with the areas inside that barrage filled with the friendly submarines operating in areas under orders, with the friendly aircraft operating against the land inside the barrage and against the sea outside the barrage, with the patrol and escort outside the barrage, with the fleet in general support outside, there is a general strategic plan. I do not accept as a valid excuse the statement that the fleet must be in readiness to repel an attempt by major ships of the enemy to raid the east coast. It is not sound under the circumstances, and the answer to it lies in your own submarines, or else you admit at once that the enemy submarines can do more than you can. It is a great mistake to attempt to make a tactical issue of the fleet when its rôle will, at the beginning at least, be strategical, and only when the local issue is forced by the minor units can you hope to draw the enemy to an action. I have talked to a great many men like Chase, Schofield, McKean, and they are in the main in agreement as to the soundness of the general strategy and in the insistence that local tactics should never be allowed to cloud correct strategic conceptions.

I don't care whether you call me a fool or not. I have studied a thousand or more plans and schemes, as I must from the nature of the duty of the board of which I am head, and more and more do I see that the aim of every good solution lies along the lines I have indicated. It is not my scheme. It, like the conference, represents the consensus of opinion on the subject, and the sounder the character of the men making the solutions, the nearer do they seem to approach to something like what I have tried to indicate above.

PERSONNEL.

You are all right in asking for all the officers and men. They ought to go and would were it a physical possibility to give them. There are many great demands—the yachts going abroad, the drifters, the number of Army transports which are coming under direct and complete Navy control, the necessity of preserving intact the skeleton of the structure of the fleet so that it shall in no wise lose in efficiency, the putting into commission the huge number of small craft, and the reserve battleships (to be used to train up new personnel)—the great increase in the numbers of officers

needed in positions of responsibility on shore and the impossibility of turning - of these duties over to untrained inexperienced men, all make the greatest demand upon the trained personnel. We must not and can not make the mistake England did in her first expeditionary army. You know it is sound just as well as I. But the spirit is with you, to give you all that can be spared, and if the staff asks for more, remember we are trying to do our best. After reading over all you had to say, Emmet's letter, I prepared the cable which put the number of reserves at one (Naval Reserves, untrained, but let us hope bright, useful men). You can work them into shape. I hope the admiral signed it. He said he would. I believe it is the best that can be done now. But remember the will is to give you all that can be spared, not only for your own use, but on the principle, which we all hold here, that a man gets the best training at the front. I have personally wanted to go with you the worst way. Chase and the others insist that this is my job, that I am giving a greater equivalent to the Government, and as you know that is out War College training.

ESTABLISHMENT OF STATIONS FOR UNITED STATES FORCES ABROAD.

As you know, if this war is going to last, and it looks now as though it would - time longer, we have only just begun to bite into the apple. It appears to me that there is a crying need for more of our forces of the antisubmarine patrol type, not only for the British areas, but for the French coast, and the Mediterranean as well.

We have established a nucleus now on the Irish coast. It is only a beginning, I hope. We are all in accord on that. It should and will be increased, compatible with our home needs, and to the supply abroad of our forces at other points.

As to our home needs, don't for a moment get the idea, or let any of those around you get it, that we are here asleep at the switch, or are being fooled by Fritz. We feel that Fritz sent the U-53 over here deliberately to impress us with what he intends to do to us, and would do to us, if we went into the war. He also might, at the very beginning, had that warning not been sufficient, sent over a few subs to strafe us. Undoubtedly there was a big war party that advocated it. But, and this is a big point, Fritz has learned that perhaps it won't pay to stir a hornet's nest up too much. He feels that if we are allowed to plod along without too much personal contact with the war, we will be slow getting under way, and moreover he dearly needs a future triumph, when this war is over. Fritz is in a quandary, he hates us and would dearly love to strafe us. He hates us even more than he does England if that be possible, but unless it be in the last final burst of rage, it hardly seems possible that there will ever be many subs sent to this side. If they do come, our answer is a dragging net for mines, off our principal ports, and a close search for possible bases with our coast guard in certain localities. These precautions, coupled with sufficient antisubmarine craft, of the general chaser or destroyer type, to give shipping an offing, is all we need on this side. I think every one on this side appreciates the situation.

Now, as to other needs abroad. We have sent Fletcher with seven yachts to a French port. A division of nine more yachts is fitting out to join him as soon as they can be made ready. They ought to be in shape very soon, perhaps by the end of this month. In addition, 12 menhaden fishermen are being fitted for service abroad. They are good boats. They ought to be ready soon. Orders are also out to get 12 submarines in shape for distant service. There is no question of the necessity of establishing an escort service on the coast of France, through the danger zone.

It has been decided to send the five destroyers in the Philippines to European waters. They will be ready to start on August 1. The 12 destroyers ordered to get ready for distant service are having their difficulties. It is doubtful if they could be gotten ready. It would be wise for you to lay down certain general requisites in the matter of type and armament for submarines which we ought to consider in our building program. As you are on the spot such recommendations would be of extreme value. About 40 more yachts will become available for distant service through the commandeering bill which has just been passed. It would be some little time before they could get across owing, to a large extent, to a lack of guns. It is the intention to push them for distant service.

There is also another locality where our efforts may be needed, that is in safeguarding shipping into the entrance of the Mediterranean. This may require a station at Gibraltar. Now, whether we should undertake operations in the Mediterranean is another question. I don't know, but it might well be discussed. However, it appears to me that the three positions outlined above come well within the scope of our future operations. If the ideas outlined above under strategic areas were considered favorably I am inclined to believe that our submarines could do good work in the North Sea area, assisting the British submarines, but I think it would be the greatest mistake to splash them around indiscriminately.

ARMED GUARDS.

This is the general name we have given to the class of operations comprised under the head individual ship protection self-contained. It has been gone into very thoroughly on this side, probably because it was the best effort we could make immediately. Schofield fathered it, and with his usual thoroughness it has been beautifully done, as far as our resources would permit. The secret of the recent successes has been the fact that it was considered a major objective, and not one of the minor considerations. I am not blaming the English—they had so many other things to think about. It has, with them, not received the proper consideration it should as one of the best defensive antisubmarine defenses. The opinion I have formed from talks with British officers seems to be this—their attitude toward the subject is this: "Any old gun will do to keep the submarines under." That is not enough. You've got to make the submarine realize that he runs a very considerable danger in attacking a ship, even if he be submerged, provided he can be detected.

This requires the most painstaking efforts along the following lines: Lookouts, maintenance, care of guns, adequate guns' crews, competent petty officers for each crew, an efficient control for each armed guard on each ship, a central control at the department which regulates the assignment of guns and crews, the proper decentralizing of this central control through the district commandants in order to secure efficient administration, and last, but not least, a proper supervision and inspection system. This supervision system requires a report from the armed guard commander for each voyage. This report is sent to Washington. The officer brings it himself. If there are glaring faults discovered, a board of investigation is ordered. At certain times the ship and armed guards are inspected by a competent officer. Plunkett does the inspection, and you can bet it is done. His inspection and the reports submitted do not stop at the armed guards. They go intimately into company methods, ship discipline, loading, discharge, and a thousand things all having a bearing on getting cargoes across safely and at speed. He is just in, and I will give you a little extract from his report. One of the ships just ready to sail (our own), the passengers coming aboard over the gangway. Near them a gun—at the gun working over the mechanism right in the midst of the bustle one of our gun crews, oiling and adjusting the mechanism, getting ready for target practice next day after clearing New York.

Near by lay the *Cretic* and *Cedric*, both of them much better and more valuable ships belonging to the White Star Line. This is what Plunkett reports: One 4-inch gun of the vintage of 1896, mounted aft, manned by two nice be-whiskered old gentlemen. This tells the story. He recommends that some of the guns on one of our liners be immediately put on the *Cedric* and *Cretic* in the general aid of shipping across.

You can't beat it. You can't dodge it. There are the facts. These cargoes are going across for the benefit of England and the Allies. They must improve on their system. There is no use saying it can't be done. It can; but to be successful it must be treated as a major objective—conservation of shipping—just as important, more, in fact, than building new shipping.

One of the inside secrets of getting results is this: Our central office in the department is in constant touch with the War Risk Bureau, under the Treasury Department. They have agreed not to give insurance, to cancel insurance, at the call of this central office. What is the result? One of the companies, say, does not want to incur a certain expense, which we consider necessary for the safety of the ship. Our agent wires to Washington. We call up Treasury, stating case and requesting cancellation of insurance. Done. Owners get busy and come through. Another case, and this is authentic: Armed guard commander reports captain as inefficient. Result: Communicate to Commerce and Labor. License canceled, after we have refused to furnish guns or guards to any ship employing that man as captain. Get me. That is the stuff that gets results.

Another thing. The petty officer of the *Silver Shell* sinks a submarine. The petty officer of the *Moreni* puts up as pretty a fight as one wants to see. Result: If these facts are authenticated these men will probably be recommended for commissions.

Schofield is the father of the scheme and he deserves an unlimited amount of credit. It is not perfect, but it is systematically done, and it is bringing home the results. I do not see the same attention to these details on the part of British ships. I am not blaming anybody. I understand perfectly why all this should appear to be of minor importance to the Allies. It was up to the 1st of February last, but it must be taken seriously now. Push it.

BOARD ON ANTISUBMARINE DEVICES.

This is a board of which Grant is at the head. It has the practical test of all sorts of devices which the other boards pass upon and consider worthy of a practical test. There are other boards, one of which I am the head of, "Devices and plans for anti-submarine war." We are in close touch with Grant, the Physical Research Council, and the Naval Advisory Council. I am telling you this because possibly you may wonder why so many schemes which on the face appear unsound, are sent over to you. I am largely responsible for it, and the idea and policy of it is this. The face value of the article presented is frequently nil, but in every case there has appeared to me to be an underlying principle which would bear scrutiny, and for that reason it has been sent over. Incidentally, I feel sure that in the course of time there will be developed on this side some form of detector which will go far to neutralize if not exterminate submarine warfare. I am not given to over exaggeration as a rule, and when I say that we may feel very hopeful, I think I am expressing what the results of recent experiments give us the right to hope for. If entirely successful, it is only a small matter and a question of short time before these detectors will be installed in great numbers. All types of craft will have them. They should be a great improvement on anything you have now.

COOPERATING OFFICERS (ESPECIALLY GENERAL STAFF).

In some of your cables and in Emmet's letter, the need for liaison officers is touched upon. That is granted. I believe the bureaus have sent representatives over to get in touch. Of course this does not fully comply with the object of your cables, but as the increase in your personnel is actually given you, then you will have a force to work with composed of some very fit men, even if taken from the Naval Reserve.

The various naval attachés from the Allied countries while the best of that particular type, do not quite fill the position which, I think, should be filled by some representative from the other side, especially from England. It does seem to me that we would get closer in touch if we had over here in this office a representative of the Admiralty General Staff. We ought to be able to talk to him every day. He is to fill us with their point of view and we to fill him with ours. He should be a man able to speak with certainty as to the point of view which is held in the Admiralty. If we are at fault, he can correct it. If we have any ideas that are worth considering he will glean them. You on that side of the water represent us, but the Admiralty is now represented over here in the way I mean. This country represents a great military reserve which is marshaling its powers to take the offensive. As your history will tell you, Wellington laid great stress in his reserves, and Wellington was one of the few men of history who, in addition to being a master tactician, was also a master of policy and strategy. Those are rare qualities to combine in one man. I feel that we do not get enough of the point of view over there, and moreover I want to know what the point of view of the man from over there will be when he comes over here.

You can not in cables give an altogether clear conception of the big point of view. We know when you want a thing, because you ask, but the underlying motives and the reasons why, and especially the British point of view which actuated you, we lose. And that has a big influence on the results of the individual requests you make. It may be all wrong, if so we want to find it out, but there has been done a vast amount of thinking on the general plan of campaign, right in this office, and many general decisions which we believe are being made we would like very much to have presented at close range. You know the American characteristic, which is, "Show me," and you know it well enough to realize that it is not sufficient, much as we regard and highly as we respect the Admiralty decisions, to absolutely accept them without close scrutiny. Neither is it a wise thing to do it, for the point of view of the man somewhat removed from the scene of strife, while it may not be of great value, is still a point of view, and it may contain food for much thought. Especially is this apt to be true in the consideration of the broader schemes. And it must be definitely realized that while we may have very little actual contact at present on a big scale at sea, yet as a reserve force of power in the future we may have a weighty part to play, and the general decisions and schemes concern us vastly. Therefore, I say, we must be in touch with the Admiralty's policy, not after the manner of a man who has something to show to an inquisitive child, but after the manner of two men respecting each other's ability, and wishing each to give and to learn from the other. They get our point of view through you, and in every way, even to gossipy correspondence, we try to keep you in touch. In your cables you do us, to the Queen's taste, undoubtedly better than it has ever been done before, but there is still that

break in the complete circuit. If you had time (and I have heard this comment before) I would write home here some of your newswy, gossipy letters. There is no necessity of censoring your letters to us. It would be the height of absurdity to do it, because the facts, the cold facts, are what we need. The only thing to do is to safeguard their transit.

I have heard the admiral, time after time, say practically the same thing. We are more than willing to cooperate in every sense of the word. This office does not have to be scared into sending ships because we do not realize the seriousness of the situation. We do. Every man jack in the plans department has laid awake nights. The admiral is willing to recommend anything, any forces, so long as he knows, and he wants to know, not in any critical spirit, but in the spirit of utmost cooperation, what the Admiralty's strategical and tactical conceptions are. Just what is their major plan? Is its fundamental conception offensive or defensive? What are the tactical details in general by which this plan is to be solved? Those are the things we want to know, and these are the things we have a right to know, especially as we are directing every effort, building, conserving, of shipping to arrive at a successful conclusion of this war, even to the possible sacrifice of our own individual good later. We could work so much more intelligently toward the same united ends if we knew a little more. And there is where a big Admiralty Staff man comes in. The liaison on little things is all right, but this war won't be won so much by the collection of details properly arranged as it will by the correct conceptions of the proper strategy and policy to pursue. It will be won all right, England can do it herself, but we can shorten the process. There are many problems, present and future, which can't go down in black and white on paper, but which might be much more satisfactorily approached had we a man on the spot in the full confidence of the Admiralty and representing them.

TRANSPORT SERVICE.

After dint of working on the subject, in conjunction with the General Staff of the Army, the conclusion has been arrived at that the transport service of the Army must be under complete naval control. So, to that end, there has been a big effort to get into the transport service some of the interned German orphans we fell heir to. That is going through, I believe. Through the insistence of Secretary Baker, who, by the way, is one very big man, this bill will be signed by the President, we have every reason to believe. This immediately puts a strain on the naval personnel, but it is one we believe we should assume. It also helps to explain why it is so difficult to meet your demands in the way of trained personnel. As our transport and convoy system stands to-day it is a cumbersome affair, and the putting of the right ships under naval control is going to vastly simplify the situation, to say nothing of safeguarding it. The ships we have taken over will be able, without strain, to put the entire Army raised over on to the shores of France in something less than a year. Submarines or no submarines, you can rest assured that army will be there in less than one year, and with it from 5,000 to 10,000 trained aviators.

People abroad do not fully realize that America has found herself and come into her own. We are slow, we are not thoroughly awake yet, but the spirit is there, and those that are directing affairs are, in the main, in this fight to the finish. I have time and again heard the possibilities discussed, of the United States being the sole one in at the finish. Of course that is overdrawn, but it means just this, if Russia quits, if France is forced to quit, if Italy is knocked out, still with England and the United States in the ring, there will be no end until the Kaiser is on his knees and on his way with his whole family to St. Helena. You have only to think of how we swallowed conscription, lock, stock, and barrel, to see how America is taking the matter. With conscription, we know nobody can touch us. It can't be done. On this continent there is a stronghold for Anglo-Saxon freedom and democracy, if everything else fails. The Army, too, understands that. There is no effort to underestimate or to hang back. It is a grim determined lot. Its one desire is to be fit and then get there. It is slow, but this time it is a sure hunch. All the Allies need to do is to hang on and one more spring, I believe, will see Fritz break. I don't care how much grub and supplies he gets then, he is going to break, and the God he profanes every day of his life won't stop him. I am constantly thrown with earnest-faced men, professors, intellectuals, scientists, all representing the best of this country, who are giving their time and talents without hope of a return except to serve in some small way. It has been a revelation, and if there are any doubts on that score, in England, you can tell them to the contrary.

The German ships we are taking into the Navy for transport service are the *Vaterland* down, 14 to 16 of their best, and we are going to see that the troops get across.

ESCORT AND CONVOY.

In your cables you have insisted upon the necessity of adopting what you call a convoy. Your assumption that merchant shipping should be escorted through the danger zone is absolutely correct. There has been no dissent there. Also what you insist upon the impracticability of escorting individual ships through is correct. The only difference lies in the details of the scheme. As I understand it, the Admiralty favors a convoy across all the way. Why? There are no raiders; if so, then a high sea patrol ought to settle that. If it is to control the merchant ship across, to see to it that he arrives at the proper rendezvous, that of course is another matter, but it does seem to me that this matter ought to be arranged in a simpler manner and in a way which ought not to interfere with the ability of the individual ship to make its best time to the point of rendezvous. You also eliminate the waste effort of assembling the different parts of the convoy, if the steady stream of shipping is kept up. What you are trying to arrive at is escort through the danger zone, in bulk and in toto, in a manner which will interfere least with the other duties falling to a lot of the vessels used for escort purposes.

I think that can be arranged in another way. If the Admiralty were to appoint a certain number of days a week during which, at certain hours, they would guarantee the escort through the danger zone in bulk of merchant shipping, and if in addition they would predict for, say, a week ahead the different rendezvous shipping bound for certain ports should arrive at, together with the hour of arrival, then the matter is in their hands. If long on escort ships, they could make the arrivals three times a week. If short, they could cut it in two. The method of procedure would be as follows: The Admiralty cables to their head men here, Gaunt, that all transatlantic shipping will be escorted in on the following days for the week ending ———. That gives them the liberty to change the days for every week, if they choose. Then they cable Gaunt that the following rendezvous are appointed for the ports indicated for that same week, ships to arrive at rendezvous at such and such a time. You are likewise informed as a check, and you inform us. Gaunt informs his shipping officers and we inform the district commandant, who is in touch with our head shipping officer at each port and has an office in the customhouse. He or they inform all shipping leaving that they must arrive at certain rendezvous at such and such a date on the hour named. The individual ship then makes the best of his way to the spot. The penalty for failure to arrive is easily arranged for our ships, being merely cancellation of war insurance unless good explanations are given. This puts the company on its metal and does not throw the onus on the conveying craft, and it does not slow up the stream. If now the Admiralty deemed it wise, just before the time of arrival at the different rendezvous, to change these rendezvous, it is an easy matter to arrange for that, by broadcast signals as at present would settle it. The matter of forming the convoy at the rendezvous is not specially difficult, if the United States officers cable to London from each office the probable dates of arrival and the numbers arriving at those dates. If one or two less turn up on the first date set, you know they will be along on the second. The inspectors for the armed guards have merely to classify the ships according to speed and have a joint agreement—A class, 8 to 10 knots, say, and mark on her side—B 10 to 12 knots, say. Give each individual ship, a number, 1, 2, 3, 4, 5, etc., and let the escort gather the A ships in one group, lowest numbers leading, the B group, lowest numbers leading, etc., and there you are. It is exceedingly simple in our case, because we have competent trained officers or petty officers on board our armed guards. Just now we are more concerned with getting the cargoes bound for the allied countries in the war zone hustled along with safety. I can not do anything the matter with that scheme, and it beats the convoy a mile, and then some. If the raider is the trouble, that can be attended to when that bridge is reached. It might necessitate periodic sailings of one of our cruisers, or it might mean the far-flung scouting line. With this scheme as a starter it is always possible for us at this end to hold up sailing days and make one sailing day, taking all vessels leaving on that day under one cruiser escort. But the crux of the matter is that the Admiralty must fix dates and points of arrival for arrivals on the other side and that we must fix them for arrivals on this side, if the necessity ever arrives for doing, due to a transfer of submarine operations to this side, and that is the very point which the Admiralty scheme never touched upon, though to us it seems the heart of the solution.

INCREASE OF FORCES ABROAD.

It ought to be definitely understood, that as a matter of policy on the part of the Admiral, there is never any objections on his part to furnishing any of the forces that may be considered necessary for the successful conclusion of this war. And I am also positive in the assertion that whatever he may say in his cables to you or

the Admiralty, or whatever he may allow to pass his censorship in the matter of letters, nothing must be considered in the light of criticism. When the matter was taken up with Gaunt, of sometimes directly communicating with the Admiralty, for the express purpose of getting in touch and cooperating fully, he insisted upon that point. In the matter of sending forces abroad, he wants to send the kinds that are wanted, and he wants to send them where it is thought they will do the most good. In all these matters, we must be guided by your judgment, after the frankest and freest expression of general policy and plan on the part of the Admiralty. The forces which I have mentioned as available soon have already been listed under the head Establishment of stations abroad. In addition to those spoken of we have placed contracts for some 360 of the 110-foot chaser type. This does not mean that all those ships will be sent abroad, but it is well for you to know what we are doing in the matter of trying to accelerate things, and if the urgent needs are presented clearly and frankly enough, we stand ready to do everything in our power to help the united cause. The deliveries of the 110-foot chasers should be coming along shortly, perhaps in another month.

OUR FLEET—TRAINING AND READINESS.

The policy in regard to this unit has been as follows: It has been thought wise to put every fighting unit in commission. There are several reasons for that. In the first place nobody can entirely foretell future eventualities. There might be a sudden call for parts of it to do service in any quarter of the world; in the second place we ourselves must be in a position to forestall any policies or plans which might be inimical to us or to the United interests; in the third place, with the tremendous increase in personnel (amounting already to over 120,000 men, and in the near future to perhaps 170,000 men) there must be facilities afforded where we can train the new men and officers thus suddenly enrolled. It can not be done efficiently at the shore stations alone, and the fleet is the reservoir which must be used for the purpose of gradually absorbing these units and welding them into a compact fighting force.

Moreover, aside from the uses these new men can be put to in the fleet, there is a growing demand for trained guns' crews and officers to put on the merchant ships to which we assign armed guards. And in this connection, before I forget it, the admiral has talked with Gaunt, has gone over the situation with Navigation and Ordnance, as to the advisability of furnishing armed guards for those ships of the Allies, or those in their service, which the Admiralty might desire us to furnish armed guards for. It only requires an expression of their desires and policy for us to take the matter under advisement. And in that connection, wherever request has been made in the past an endeavor has been made to meet the wishes expressed.

As far as the fleet itself is concerned, the first objective has been to put it in material readiness throughout. After that is accomplished it is the admiral's desire to see it trained to the minute as a fighting unit, especially in the matter of gunnery. The Admiralty expert who was here made a searching inspection of it in order to develop any of the weaknesses which the British experience at Jutland showed might exist. It has been of tremendous advantage to us to have the benefit of such candid judgment, and we feel that the Admiralty is to be heartily thanked for so freely giving us the benefit of its experiences. The necessary changes will be undertaken at once. In the matter of training, the admiral feels that a fleet to be efficient as a fighting unit must be a mobile unit and trained at sea. It can not efficiently train in too inclosed waters, and it must develop the sea habit.

Not only must the fleet be trained to the minute as a compact fighting unit, but those who are concerned with the intimate direction of its affairs must constantly have the broadest point of view and the most unlimited information, in order that at any moment it may be able to adjust itself to changed conditions or to increased activities. For that reason, while the entire freedom of initiative was given in your instructions to meet any situation which might arise abroad, it was thought that the commander in chief of the fleet should be kept informed of so much of the situation as he might need in order to formulate any plans which might at some future time contemplate the use of our entire fighting force as one unit.

In order that the fleet may be in closest touch at all times with every phase of the situation, not only on this side of the water but also abroad, the admiral has endeavored to establish the closest sort of cooperation and information service between the fleet and this office, and I feel sure that he would view with favor any effort on their part to establish permanent relations, even to a desk here, between this office and the grand staff of the commander in chief. Such a move on their part I feel sure would tend to broaden the point of view of the fleet—get them more away from local issues, which can easily be attended to by the battleship and other staffs, and at once put them au courant with affairs abroad.

There is a question pending of sending the commander in chief with a part of his staff and a representative of this office to discuss questions with the Admiralty, and get first-hand information and impressions. An ultimate decision has not been reached.

A general statement of naval policy along certain lines concerning the Allies has been prepared, and when it stands approved, will be cabled to you. It is the intention to keep you posted by cable with whatever policies are decided upon as being the policies to be adopted.

AIRCRAFT OPERATIONS.

A cable was sent you the other day as you remember, asking you to outline the character and extent of operations in the air which our naval air forces might at some near time be called upon to undertake in the service of the allied operations. It is necessary to know this in order to make the proper estimates of numbers of craft and personnel to ask Congress to appropriate for. These aircraft abroad must be additional to the units considered necessary to retain in the United States and with the fleet.

As you perhaps know from seeing it in our papers, there is being made by the Army a very decided drive at a huge increase in the flying force for the land. There are some 600,000,000 of dollars being asked for. I am personally heartily in favor of an intensive drive in this direction by the land forces, for to me it seems the line of least resistance their efforts can take. Moreover, it is the one effort which can be intensified most rapidly and it is essentially adaptable to the qualities of our newly enrolled personnel.

It is, however, essential that we know the relations which are supposed to exist abroad, between the sea flyers and the land flyers, and the scope of their individual efforts. Would our sea flyers be asked to undertake land operations, perhaps against naval bases, or would their efforts be confined to the antisubmarine and patrol efforts at sea? This is asked because the papers print news from time to time of the efforts the British sea flyers are making on land, and if such an effort were to be asked of us it would be well to be prepared in the matter of machines and instruction of personnel.

Moreover, with such a concentrated drive on the part of the Army for material, it behooves the Navy to have its plans laid else it will be driven out of the market. There is also an effort on the part of certain forces in this country to establish an entirely separate air service, one which is a function by itself and apart from either the Army or the Navy. I can not speak for the Army, but it appears to me that an air service working at sea in conjunction with the Navy must be an integral part of the Navy in order to give efficient service. Still those are matters of which we have had no practical experience in war, and any information bearing on that subject, especially the Admiralty's policy toward their flying units, would be of value. The technical information in the matter of machines, engines, etc., we are getting, notes on the training of flyers, are coming in, but the underlying policy is somewhat hazy and we would be glad to get anything you might have to tell.

FUTURE EVENTUALITIES.

Those are difficult to foretell. Personally, I feel strongly that if we do our best to cope with and surmount the present situation, the future will take care of itself. Nevertheless, we on this side of the water ought to have the absolute assurance that our future interests will be safeguarded. It is much like the wife who says to her husband "I know you love me, but it would be awfully nice if you would tell me so once in a while."

FINALLY.

I met Arthur Pollen for a moment the other day. He said, "That man Sims has simply taken the country by storm; besides, he is so preposterously good looking over 6 feet 3." There speaks the Englishman, and we realize the pith of your statements when you say that whoever we send over must have good presence. He said, as an example, and it takes one who knows the English character to appreciate the foothold you have gained, "I say, do you realize Sims is the only foreigner that has commanded a fleet practically entirely made up of British units for over 400 years?" That tells the story as nothing else could do it. It shows, and I think everybody here realizes, that you are essentially the man for the job. So I beg of you when you read my amateurish attempts to say something, you will have patience and much forbearance. Though ignorant, I am willing and always trying to be cheerful. I am going to ask the admiral to censor this, as I do not want to be guilty of expressing opinions, however innocently, that are incorrect wherever I refer to any expressed policy of his or the department's.

Poor old Chase dies last Sunday night (June 24) suddenly. His heart gave out. He went to sleep in his bed and never awoke. I feel his loss keenly, as I have always regarded him as one of the brightest thinkers this Navy has ever produced. He had the faculty of the broad gauge of being able to visualize events. Moreover, I was personally very fond of him, for his kindness of nature and charity toward others was a lesson to all of us. He can not be replaced. The admiral has directed me to temporarily look out for his desk until he chooses his successor.

Your two letters just received. They clear matters more than anything I have heard yet. Also pardon the amateur strategist. Some day, if I live long enough, I may learn, but I have my doubts. Give my best to Babby and Daniels. They are towers of strength. Your weekly mail just in. I am noting the lack of information which ought to go to you directly and will hunt up the source of the trouble. Did you get the cable about appointing rendezvous for *Celtic*? I tried the direct method in this case, instead of routing through Gaunt, which I find has been the method of procedure. There is a screw loose somewhere, probably, and we will try to hunt it up. That is my hobby, learned from destroyer experience, that and cooperation. I remember with much pleasure the system established by Babcock with the able assistance of Daniels and Sparks.

Pardon the intricacy of expression. I can not use a typewriter, think, and spell at the same time, even with one finger.

Yours,

PRATT.

P. S.—H. H. Ward, you know him, wants to get in the game. He has had a lot of naval experience, is a very keen man, and would like to serve abroad. I told him I would suggest his name to you if he had no objection, and he said very glad if I would.

Finally presuming that I may be asked the direct question (1) "Were we prepared for war April 6, 1917?" and rather than answer offhand, I prefer to give an answer after making a study of the situation as it existed at the above date. This is a difficult question to answer honestly without unintentionally giving wrong impressions on one side or the other. If this question means (2) "Were we on the above date, April 6, 1917, with the forces we had at our command, materially fit and adequately manned ready to cope with Germany alone?" the answer must be emphatically "No." A comparison of the naval forces available for a fleet engagement at that date would read approximately as follows:

German high seas fleet, April 6, 1917:

19 dreadnoughts.
5 battle cruisers.
34 light cruisers.
4 mine-laying cruisers.
196 destroyers.
18 old battleships.
3 old cruisers.
6 auxiliary mine layers.

150 submarines, of which only a certain number would be available if the engagement took place in the western Atlantic. The number of destroyers would also be reduced probably. This represents the maximum German force.

United States forces fit and ready to fight, April 6, 1917:

| | |
|---------------------------------------------------|--------------------------|
| 13 Dreadnoughts (<i>North Dakota</i> not ready). | 0 cruisers, first class. |
| 0 battle cruisers. | 1 cruiser, second class. |
| 2 old battleships. | 2 light cruisers. |
| 2 armored cruisers. | 0 submarines. |
| | 23 destroyers. |

The answer to such a comparison of forces named must naturally be "No," although I still believe that, ship for ship, our dreadnoughts could more than take care of an equal number of the enemy dreadnoughts, and were in splendid shape as those admirals who were in the fleet certainly know.

If the original question means (3) "In case every available unit of the United States were mobilized in one spot and were in every respect ready to fight, would we be prepared on April 6, 1917 to meet

Germany alone?" this question requires a still further estimated forces.

German high seas fleet, April 6, 1917: Same as outlined above.

United States forces prepared under hypothetical assumption made above:

14 dreadnoughts.

0 battle cruisers.

19 old battleships, excluding *Iowa*,
Massachusetts, *Oregon*, *Indiana*.

9 armored cruisers.

4 first class cruisers.

8 light cruisers.

51 destroyers.

17 submarines (of the H class and late types which might be used in an engagement in the western Atlantic).

This force comprised our total fighting Navy which could be considered as in any way useful for fleet action. Making a comparison of forces and allowing for the long Atlantic trip on the one hand (that of Germany) and of our new personnel on the armored cruisers and old battleships, I am of the opinion that the answer is still "No," owing to the disparity in dreadnoughts and battle-cruiser types more than to any other reason, though I do believe it would have been a wonderful battle and the German fleet would not have been worth much after it was over.

In order to further accentuate this hypothetical condition, I wish to ask myself another question: (4) "Suppose that on April 6, 1917 the United States fleet had been forced, in the state of preparedness it then was, to meet single-handed the German high seas fleet, in the state of readiness the high seas fleet was supposed to be in on that date, what would be your opinion of the state of preparedness we were in?" My answer to this question would be, "I would consider such a state of affairs to be criminal."

However, these are hypothetical conditions. They are not the conditions which confronted us April 6, 1917, and I only consider them because the committee has chosen to ask so many questions along this line, that I wish to give correct and accurate opinions in so far as I am able to do so. The real situation was this: The German fleet was contained in their home waters, had been so contained for a long time, and to meet our fleet would have to fight its way past the British grand fleet, a force consisting of the following

British grand fleet:

36 dreadnoughts.

11 battle cruisers.

43 light cruisers.

7 cruisers.

22 flotilla leaders.

184 destroyers.

Some submarines.

Therefore in the light of hard cold facts, and we naval men must fight facing facts and not hypothetical conditions, let us ask ourselves another question: (5) "On or about April 6, 1917, if the high seas fleet had forced itself past the British grand fleet, would the United States fleet, just as it stood on that date under the conditions stated in question (2), would it have been prepared to meet the German high seas fleet?" The answer must be emphatically "Yes," and that was the opinion of every naval man I know at the time.

Let us once more facing the actual conditions ask another question: (6) "Suppose that on April 6, 1917, our entire naval force had been ready and mobilized and had sailed on that date for Europe would we then have been prepared to wage war under the actual

conditions existing at that date?" This requires still another estimate of our forces that have sufficient capacity to cross the Atlantic.

Estimate of United States forces under condition (6):

| | |
|----------------------------------------|-----------------------------------------|
| 14 dreadnoughts. | *3 converted yachts. |
| 0 battle cruisers. | 7 tenders. |
| 0 armored cruisers. | About 12 tugs and special service ships |
| 1 battleships. | (repair ships, etc.). |
| 0 scouts. | 22 fuel ships. |
| 4 cruisers, first class. | 5 supply ships. |
| 3 cruisers, second class. | 4 transports. |
| 15 cruisers, third class. | *10 gunboats. |
| *51 destroyers (750 tons and greater). | Perhaps 15 submarines (very doubtful). |
| *16 coast torpedo vessels (420 tons). | *About 4 coast guard ships. |

This would represent 100 per cent of efficiency if everything worked like clockwork. Of all these ships the only ones which can be called real submarine fighters are the 51 destroyers of 750 tons. The 16 coast torpedo vessels are of very doubtful value, old and not good sea-keeping craft of small radius of action; the 3 converted yachts, the 10 gunboats, and the 4 coast guard ships are not fighters, but might be useful for escort and patrol. The other types, except the cruisers for convoy, are not wanted on the other side. Therefore absolutely disregarding our own needs, our own patrol and our own fleet needs, are we still prepared to wage efficient war against the submarines, if every one of the craft enumerated, valuable for antisubmarine work April 6, 1917, sail at once. The total at utmost is 99, counting submarines. Let us make a comparison of this effort with the antisubmarine effort the Allies were making, as nearly as I can estimate:

| | |
|-----------------------------------------------------------------------------------------|-------|
| Total British and French antisubmarine forces around British Isles and in Atlantic..... | 967 |
| French, British, and Italian forces in Mediterranean..... | 736 |
| Total..... | 1,703 |

In other words, our total effort in that line, if we could have executed it instantly, could not have exceeded a ratio of 1 to 17, provided we neglected everything else and everything worked like clockwork, or between the 5 and 6 per cent stated by Admiral Sims (my conclusions being worked out independently). Therefore, if we could have instantly applied our forces, with its good, indifferent, and its bad antisubmarine factors in it, to the aid of the Allies during the month of April, and taken to ourselves our proportionate share of the April losses in merchant tonnage, what would have been our share? It ought to be in proportion to the relative force we might have applied; that is, we might have had a maximum 1 to 17, or 5 per cent interest in it. The April sinkings were by long odds the greatest, amounting to 846,863 tons for that month as against 558,712 tons average, if we take the six very worst months, including April, and so on. So on the 5 per cent proportion of our interest of the worst month, April, we had to our discredit a maximum of 42,343 tons of shipping, or a total of 254,058 tons for the next six months, provided we had not done a thing, and the submarine had been able to sink his 846,000 tons, month by month, which, of course, we know he did not do. On the average six months' loss, 558,212 tons basis, our monthly discredit share is 27,910 tons, and our total six months' discredit share 167,460 tons. Two things stand out now with some emphasis, (a) the statement that we are responsible for two and one-half million

tons shipping loss is not so, looking at it in the light of cold figures; (b) the somewhat novel point of view that we would not have been prepared for this war had we been prepared for war as under assumption (6).

Let us make another assumption (7): Suppose the Navy Department had so advanced its program of preparedness that on April 6, 1915, its naval force consisted of all the craft available for use April 6, 1917, plus all of the five year program of 1915 additional, every ship thoroughly manned and fit to sail immediately on April 6, 1917, would we then have been adequately prepared to enter this war as it existed April 6, 1917?

Statement of United States forces April 6, 1917 under assumption (7):

24 dreadnoughts.
6 battle cruisers.
9 armoured cruisers.
10 scouts.
*101 destroyers.
9 fleet submarines.
4 cruisers, first class.
3 cruisers, second class.
15 cruisers, third class.

*16 coast torpedo vessels.
*3 converted yachts.
Over 40 fuel ships, transports, supply ships.
About 10 gunboats.
*About 4 coast guard ships.
*Perhaps 15 smaller submarines (doubtful value).

To have maintained this fleet for two years including personnel alone, including first cost, would at the very lowest figure come to over five hundred and thirty millions. Would we still have been adequately prepared?

Our actual effective antisubmarine increase would have been in 50 destroyers approximately, making our total effective antisubmarine force approximately 150 under assumption (7) as against about 100 under assumption (6). The ratio to allied antisubmarine effort would now be 150:1700 or about as 1:11. Whereas the total pool to that date consisted of five nations, United States, Great Britain, France, Italy, Japan, or 1:5. Our antisubmarine effort was 1:11 or about one-half of what as a nation we ought to contribute on a 50-50 basis for all, even taking into consideration our wealth, the expenditure of over five hundred and thirty millions and our evident eagerness for preparedness on a great scale. What would have been our gain? (a) The ability to whip Germany alone on any sea; (b) the trained personnel we would have. What would be our loss. (c) Still unprepared to enter this war as it opened up April 6, 1917; (d) the expenditure of at least five hundred and thirty millions, which represents approximately 260 destroyers. The answer to assumption (7) would have to be, "No; still not prepared for this war." A vital question now is, this, (8) To what extent did the shortage of personnel, did the lack of preparedness in personnel, affect our efforts in this war? This is the guage by which efficiency or inefficiency is measured in this respect, and it is the last test.

To answer this a résumé of our war operations is necessary.

WAR OPERATIONS.

(1) Fleet action or operations: No action probable; does not operate in face of the enemy.

(2) Raiding: Yes, probable; to be met by cruisers, escort ships.

(3) Antisubmarine tactics, escort: Yes, very important; to be met by destroyers, yachts, gunboats and all antisubmarine craft.

- 4 Transportation of troops: Yes, necessary; to be met by manning troop transports with naval crews.
- 5 Supplying troops: Yes, necessary; to be met by manning merchant supply-ships with naval crews.
- 6 District or coast defense: None probable except for mine sweeping.
- 7 Armed guard: Yes, necessary; for ships operating in war zone and not fully manned by naval crews.
- 9 Patrol: Not necessary; in vogue at time we entered war; advised by British in April, 1917; abandoned by them when convoy was adopted; abandoned by us the instant its uselessness was seen.
- 10 Submarine efforts: A limited necessity; to be met by manning submarines.
- 11 Submarine hunting by sound: Very doubtful value; met by manning submarines.
- 12 Aircraft efforts: Yes, valuable; to be met by organizing Air Service.
- 13 Offensive mining northern barrage: Yes, important; to be met by manning mine craft.
- 14 Great naval guns on western front: Of value; met by organizing great gun forces.
- 15 Shore bases and other shore activities: Important; met by manning shore bases.
- 16 Create personnel: Most important; met by enlisting and training.

This represents probably a résumé of our operations. Of these, the operations which stand out in importance at once April 6, 1917, and must be attended to are (2), (3), (7), (9), and above all (16). Hence every effort as it came up had to make way for those mentioned above, and especially for (16). Our reserve lay in (1). (3) particularly had to be attended to at once, and we were particularly fortunate and prepared in having our gunboats, most small cruisers and most destroyers, manned. They were, therefore, except for certain material repairs which constantly occur, ready for operating at once. (7) was the next immediate necessity and that was handled by adjustments among our regular personnel. (4) and (5) came along simultaneously, but later, because the troops were not ready at once in appreciable numbers, consequently time was at hand for manning troop and supply ships. (15) could be handled with a nucleus and was used in conjunction with (16), so that (1) and (15) became great centers for developing (16). (2) had to be considered immediately, and as most of the larger cruisers were not adequately manned this had to be undertaken at once. This was the work of the Bureau of Navigation, and it was accomplished.

I was in charge of operations, personally in touch with them all from the date I became aid, and I can not recall now where our operations were held up for lack of personnel. We operated, and that is the final test. Do not get the impression that I, as a naval man, and always looking for the 100 per cent efficiency mark in our naval operations, subscribe to a policy of insufficient personnel. I do not believe it is the proper policy to have an inadequate personnel equipment. All I say is that the responsible heads had sized up the situation, or, say, the situation so adjusted itself that our Navy was equal to meeting its operating obligations, great as they were, with a degree of efficiency which placed it in the satisfactory class so far as accomplishment was concerned.

Let us again consider this problem from still another angle. (9) "If now, in spite of our great preparations as enumerated in (7) we are still not prepared to enter this war, what must we do to make us prepared for this particular war?" A recapitulation of (7) shows us that building a fleet sufficient to wipe Germany off the seas at an expenditure of half a billion dollars, will not do it.

What else can the Navy do to aid? Is there anything? Yes: (a) More destroyers could have been built earlier. We could have laid down a program in 1915 of 200, similar to that asked for in July, 1917. Was any man wise enough to see it, or, seeing it, could our Government have started such a program without committing an overt act; for, unlike a program for a balanced fleet, under the conditions then existing, the building of 200 destroyers could be directed at but one object—a counter to the submarines, Germany's sole operating sea force.

However, for the sake of argument, let us admit the point and say it could be justified. What other acts could the Navy do? (b) We could have started taking over and manning troop and supply ships. This would have been an overt act. But this would have availed the Navy no more than its great fleet of assumption (7) availed it, unless two other acts, entirely outside of naval jurisdiction, had happened at the same time. (c) One was the mobilization of our civil industries on a war basis and (d) the other was the mobilization of our man power on a military basis. Gentlemen, these last two acts are overt acts of war and were so regarded by at least one nation, Germany. The contributing effort of the Navy toward its greatest military achievement in this war—the safe transport of troops—could not be accomplished, however, without the actual accomplishment by other forces than the Navy of (c) and (d). Yet, on lesser ground than these, the whole question of our naval preparedness seems to be revolving. Had it been possible even for us to have concealed our gigantic efforts from Germany, would it have been worthy the dignity of a great nation to have deviated one hair's breadth from that straight path of neutrality, on which we had staked our national word of honor until the day when, exasperated beyond endurance, the Nation, through its representative heads, declared war?

Was the Navy on April 6, 1917, prepared for war—that is, as prepared as human effort working under a democratic form of government could make us fit? That is what our country wants to know, and that, to my mind, is what you gentlemen have a right to know.

The above analysis is relative to our fighting forces, their strength and disposition; but is that all? No; there are certain basic principles upon which sound organization and administration must rest. The Navy exists for a purpose. It is the will of our country that its Navy should be the first barrier which the enemy must smash before it reaches our shores. It is, further, the right arm of the united people in maintaining right and justice. Therefore, the Navy must be sound from top to toe. But no organization is sound unless you give the power where it rightly belongs and fix the responsibility for its proper administration. The law on the subject of the organization of the Navy Department is as follows:

NAVY REGULATIONS.

SECTION 1.—*Organization.*

101. There shall be at the seat of government an executive department, to be known as the Department of the Navy, and a Secretary of the Navy, who shall be the head thereof. (Sec. 415, R. S.)

102. (1) An Assistant Secretary of the Navy is authorized by law, who shall perform such duties as may be prescribed by the Secretary of the Navy or required

law. Acts of July 11, 1890, and Mar. 3, 1891.) All orders issued by the Assistant Secretary in conducting the duties assigned him shall be considered as emanating from the Secretary and shall have full force and effect as such.

2. In case of the absence of the Secretary of the Navy his duties shall be performed by the Assistant Secretary of the Navy. (Sec. 177, R. S.)

103. (1) There shall be a Chief of Naval Operations, who shall be an officer on the active list of the Navy appointed by the President, by and with the advice and consent of the Senate, from among the officers of the line of the Navy, not below the grade of captain, for a period of four years, who shall, under the direction of the Secretary of the Navy, be charged with the operations of the fleet and with the preparation and readiness of plans for its use in war. (Act, Mar. 3, 1915.)

2) Hereafter the Chief of Naval Operations, while so serving as such Chief of Naval Operations shall have the rank and title of admiral, to take rank next after the Admiral of the Navy, and shall, while serving as Chief of Naval Operations, receive the pay of \$10,000 per annum and no allowances. All orders issued by the Chief of Naval Operations in performing the duties assigned him shall be performed under the authority of the Secretary of the Navy, and his orders shall be considered as emanating from the Secretary, and shall have full force and effect as such. To assist the Chief of Naval Operations in performing the duties of his office there shall be assigned for this exclusive duty not less than 15 officers of and above the rank of lieutenant commander of the Navy or major of the Marine Corps: *Provided*, That if an officer of the grade of captain be appointed Chief of Naval Operations he shall have the rank and title of admiral, as above provided, while holding that position: *Provided further*, That should an officer while serving as Chief of Naval Operations, be retired from active service he shall be retired with the lineal rank and the retired pay to which he would be entitled had he not been serving as Chief of Naval Operations. (Act Aug. 29, 1916.)

(3) During the temporary absence of the Secretary and the Assistant Secretary of the Navy the Chief of Naval Operations shall be next in succession to act as Secretary of the Navy. (Act, Mar. 3, 1915.)

104. (1) The business of the Department of the Navy shall be distributed in such manner as the Secretary of the Navy shall judge to be expedient and proper among the following bureaus:

First, a Bureau of Yards and Docks.

Second, a Bureau of Equipment.

Third, a Bureau of Navigation.

Fourth, a Bureau of Ordnance.

Fifth, a Bureau of Construction and Repair.

Sixth, a Bureau of Steam Engineering.

Seventh, a Bureau of Supplies and Accounts.

Eighth, a Bureau of Medicine and Surgery. (Sec. 419, R. S.)

(2) The several bureaus shall retain the charge and custody of the books of records and accounts pertaining to their respective duties, and all of the duties of the bureaus shall be performed under the authority of the Secretary of the Navy, and their orders shall be considered as emanating from him and shall have full force and effect as such. (Sec. 420, R. S.)

(3) The Judge Advocate General of the Navy shall perform such duties as may lawfully be required. (Act June 8, 1880.)

You have by law appointed a head, but have not definitely placed responsibility. As the head of an organization, there is the perfectly natural inclination to perform such acts as in his judgment he deems wise, but upon these acts depends the entire present and future of our Naval Establishment, its development, maintenance, and operation. To efficiently effect this requires the most intimate knowledge of the Navy and the power to coordinate its many activities. As its development, maintenance, and operation is conducted, so fares the fate of the country's first line of defense.

To administer the duties of chief executive of this department there is called a civilian. Gentlemen, please do not misunderstand me. Under no circumstances should the supervisory head be other than a civilian, who in this capacity is best able to coordinate the Navy's activities with Congress, and who in his person is the strongest connecting link between us and the people. He comes to the office

as an individual, a splendid man, able, efficient, highly trained in some subject, but not technically trained in the activities of the Navy nor a student of the art of war. This system functions after a fashion in peace, but it does not function when preparation for war becomes necessary nor does it function in war. It is necessary that at the outbreak of hostilities the military head should assume the direction of and responsibility for the conduct of military operations, for whose preparation he has had, by law, no direct control nor authority to coordinate in peace. Such is the system we work under to-day and did at the outbreak of war. Thanks to the voluntary and hearty cooperation of every distinct departmental organization, including the Secretary, the Navy was able to pull itself together and to work exceedingly well in war.

If any lack of preparation existed within the naval service prior to our entry into the war, if any lack of harmony existed then or exists now within our Navy, it can be laid more justly to the system of organization the department labors under than upon the shoulders of any individual.

That completes my statement.

The CHAIRMAN. The subcommittee will adjourn until to-morrow morning at 11 o'clock.

(Thereupon, at 1.25 o'clock p. m., the subcommittee adjourned until to-morrow, Thursday, April 22, 1920, at 11 o'clock a. m.)

NAVAL INVESTIGATION.

THURSDAY, APRIL 22, 1920.

**UNITED STATES SENATE,
SUBCOMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.**

The subcommittee met, pursuant to adjournment, at 11.30 o'clock a. m. in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, Pittman, and Crammell.

TESTIMONY OF CAPT. W. V. PRATT—Resumed.

The CHAIRMAN. The committee will come to order.

Capt. Pratt, the committee looks on you as a source from which much valuable information can be drawn, so that we shall probably ask you quite a number of questions.

Capt. PRATT. Aye, aye, sir.

The CHAIRMAN. What were your duties at the outbreak of the war, April 6?

Capt. PRATT. I was in the Office of Operations, in a subordinate capacity, as one of the members of the planning section, having been ordered exclusively to duty in operations from the Army War College. Previous to that duty I had had additional duty in the Office of Operations, beginning about the 1st of February, 1917.

The CHAIRMAN. Until April 6?

Capt. PRATT. Until April 6, when I went on duty in operations exclusively.

The CHAIRMAN. What was your duty from the 1st of February until the 1st of April in the Office of Operations?

Capt. PRATT. In the plans section, doing the same work that I am doing exclusively from April 6 until June 25.

The CHAIRMAN. And your work was exclusively that of working the plans section?

Capt. PRATT. Absolutely.

The CHAIRMAN. When were you definitely assigned to duty as assistant to the Chief of Operations?

Capt. PRATT. I was assigned duty as aide for operations or assistant operations—I do not know exactly what the legal expression is—June 25. The office of Assistant Chief of Naval Operations had not been created—has not been created by law. I was appointed some time later, by an order from the Secretary, Assistant Chief of Naval Operations. I practically assumed that duty when Acting Chief of Naval Operations immediately upon Admiral Benson's first departure to Europe, in the fall of 1917. The aide for operations was recognized as the policy aide, and he was the officer who automatically succeeded to the chief's functions whenever the chief was absent.

third man. We had all been students of the Naval War College, as was Admiral Sims also; and so in talking things over we had rather a definite idea of what we thought should be done.

The CHAIRMAN. You say, then, that the plan of February 10 is the only one you recollect which was drawn up to meet the plan of warfare in which the Navy might be engaged, and that that was lost? Now, did you make any effort to prepare plans for that purpose?

Capt. PRATT. Yes, sir.

The CHAIRMAN. I think your testimony shows that you did.

Capt. PRATT. Yes, sir; I think most of those that I submitted I wrote myself.

The CHAIRMAN. Those were definite plans?

Capt. PRATT. It is very difficult, sir, to quite draw the line where policy melts into plan and where plan passes from its general aspect into definite action. Those plans that I outlined looked behind, looked at the time we were in, and tried to look ahead; and a great many of them passed from the atmosphere of policy into definite action.

The CHAIRMAN. But how did they so pass?

Capt. PRATT. They passed because I afterward became the operator.

The CHAIRMAN. Until you became the operator did they so pass?

Capt. PRATT. I think a great many of them did. Every one of these that I made out I laid on Capt. Chase's desk, and he took them home with him and studied them, and we used to talk over the subject a great deal, and while of course, as the executive, he knows exactly what he did and I do not——

The CHAIRMAN. Capt. Chase was aide or assistant for operations?

Capt. PRATT. Yes.

The CHAIRMAN. The position you afterwards filled?

Capt. PRATT. Yes.

The CHAIRMAN. Then your plans were more or less in the nature of suggestions and memoranda for him?

Capt. PRATT. That is exactly what they were intended to be.

The CHAIRMAN. And they did not have to be specifically approved by the Secretary of the Navy?

Capt. PRATT. No—yes.

The CHAIRMAN. Not as coming from you but as coming from Capt. Chase?

Capt. PRATT. Oh, yes; my suggestions would not have weight with him at that time. Anything from me would have to pass through my more immediate head, Capt. Chase. I did not see the Secretary at that stage of my existence.

The CHAIRMAN. And you have no knowledge that they were used officially as the plans of the department, officially approved by the Secretary in any case?

Capt. PRATT. Oh, no sir. We can only judge of that by the events, and the data which I have submitted. Those can only be passed upon in the light of the cold facts which I have presented. Dates of sailing of ships, and so on.

The CHAIRMAN. Others were also making suggestions at the same time.

Capt. PRATT. Yes; Capt. Schofield——

The CHAIRMAN. Others in the planning section?

Capt. PRATT. Yes; Capt. Schofield and Capt. Scott.

The CHAIRMAN. But you do not know of any general plan that was adopted officially prior to the declaration of war or immediately thereafter?

Capt. PRATT. I am afraid, sir, that a general plan such as I understand you to mean would not work other than to fit us and to project the first movement. I found frequently—I found once—that leaving the department for two days and not being in touch with movements that happened during that time, I lost touch.

A general plan such as I think you mean would soon have been so far behind in the race that it would never have caught up.

The CHAIRMAN. Then do you know of any special plans that were prepared and put into operation at that date, officially approved.

Capt. PRATT. Why, the sending of ships is the actual result of a special plan.

The CHAIRMAN. But not a previously prepared, written out plan that was understood to be a policy of the Navy Department.

Capt. PRATT. That as I told you, sir, I do not know about.

The CHAIRMAN. You do not know about whether Capt. Chase approved of all of your suggestions?

Capt. PRATT. No, sir; I do not.

The CHAIRMAN. You do not know what became of them; except as they were put into operation by you when you succeeded Capt. Chase?

Capt. PRATT. I do not. He died, and I was not in touch with his papers to that extent. I do know definitely of two plans that he told me to go ahead on, and push through. One of them was that plan which I told you had been worked out in great detail, the taking of guns off our cruisers and old battleships to arm merchant ships. I took that plan along with me and executed it.

Also there was a plan for getting the German ships into our service and manned.

The CHAIRMAN. You were given the execution of those two plans yourself?

Capt. PRATT. I executed those plans myself.

The CHAIRMAN. Prior to your appointment as head of the Bureau of Operations?

Capt. PRATT. Yes; and I also submitted that plan which I submitted here in full, the plan of the board of antisubmarine devices, in which we went a trifle beyond our province and recommended 200 destroyers; I was the head of that. I do know about that.

The CHAIRMAN. The time between April 6 and June 25, when you became aid or assistant for Operations, do you know what procedure was followed in handling dispatches from Admiral Sims?

Capt. PRATT. Yes; I know that. The method was somewhat as follows: It was very poor. The communication between us and any officers we might have abroad followed a system which had been in vogue for a long time. It was this: It was more of a diplomatic way of doing things than what I should consider a practical way. Admiral Sims's cables came to the Office of Naval Intelligence. They were translated there—decoded—sent to the Office of Operations and there the reply was written out. This reply was then sent to the Office of Naval Intelligence, there coded, and if our codes, which at that time were not good, were not adequate, the reply was put into the P or Q code, which were British codes, and sent through the British officials,

third man. We had all been students of the Naval War College, and Admiral Sims also; and so in talking things over we had rather a definite idea of what we thought should be done.

The CHAIRMAN. You say, then, that the plan of February 10 is the only one you recollect which was drawn up to meet the plan of warfare in which the Navy might be engaged, and that that was lost? Now, did you make any effort to prepare plans for that purpose?

Capt. PRATT. Yes, sir.

The CHAIRMAN. I think your testimony shows that you did.

Capt. PRATT. Yes, sir; I think most of those that I submitted I wrote myself.

The CHAIRMAN. Those were definite plans?

Capt. PRATT. It is very difficult, sir, to quite draw the line where policy melts into plan and where plan passes from its general aspect into definite action. Those plans that I outlined looked behind me at the time we were in, and tried to look ahead; and a great many of them passed from the atmosphere of policy into definite action.

The CHAIRMAN. But how did they so pass?

Capt. PRATT. They passed because I afterward became the operator.

The CHAIRMAN. Until you became the operator did they so pass?

Capt. PRATT. I think a great many of them did. Every one of these that I made out I laid on Capt. Chase's desk, and he took them home with him and studied them, and we used to talk over the subject a great deal, and while of course, as the executive, he knew exactly what he did and I do not——

The CHAIRMAN. Capt. Chase was aide or assistant for operations?

Capt. PRATT. Yes.

The CHAIRMAN. The position you afterwards filled?

Capt. PRATT. Yes.

The CHAIRMAN. Then your plans were more or less in the nature of suggestions and memoranda for him?

Capt. PRATT. That is exactly what they were intended to be.

The CHAIRMAN. And they did not have to be specifically approved by the Secretary of the Navy?

Capt. PRATT. No—yes.

The CHAIRMAN. Not as coming from you but as coming from Capt. Chase?

Capt. PRATT. Oh, yes; my suggestions would not have weight with him at that time. Anything from me would have to pass through my more immediate head, Capt. Chase. I did not see the Secretary at that stage of my existence.

The CHAIRMAN. And you have no knowledge that they were used officially as the plans of the department, officially approved by the Secretary in any case?

Capt. PRATT. Oh, no sir. We can only judge of that by the events, and the data which I have submitted. Those can only be passed upon in the light of the cold facts which I have presented dates of sailing of ships, and so on.

The CHAIRMAN. Others were also making suggestions at the same time.

Capt. PRATT. Yes; Capt. Schofield——

The CHAIRMAN. Others in the planning section?

Capt. PRATT. Yes; Capt. Schofield and Capt. Scott.

The CHAIRMAN. But you do not know of any general plan that was adopted officially prior to the declaration of war or immediately thereafter?

Capt. PRATT. I am afraid, sir, that a general plan such as I understand you to mean would not work other than to fit us and to project the first movement. I found frequently—I found once—that leaving the department for two days and not being in touch with movements that happened during that time, I lost touch.

A general plan such as I think you mean would soon have been so far behind in the race that it would never have caught up.

The CHAIRMAN. Then do you know of any special plans that were prepared and put into operation at that date, officially approved.

Capt. PRATT. Why, the sending of ships is the actual result of a special plan.

The CHAIRMAN. But not a previously prepared, written out plan that was understood to be a policy of the Navy Department.

Capt. PRATT. That as I told you, sir, I do not know about.

The CHAIRMAN. You do not know about whether Capt. Chase approved of all of your suggestions?

Capt. PRATT. No, sir; I do not.

The CHAIRMAN. You do not know what became of them; except as they were put into operation by you when you succeeded Capt. Chase?

Capt. PRATT. I do not. He died, and I was not in touch with his papers to that extent. I do know definitely of two plans that he told me to go ahead on, and push through. One of them was that plan which I told you had been worked out in great detail, the taking of guns off our cruisers and old battleships to arm merchant ships. I took that plan along with me and executed it.

Also there was a plan for getting the German ships into our service and manned.

The CHAIRMAN. You were given the execution of those two plans yourself?

Capt. PRATT. I executed those plans myself.

The CHAIRMAN. Prior to your appointment as head of the Bureau of Operations?

Capt. PRATT. Yes; and I also submitted that plan which I submitted here in full, the plan of the board of antisubmarine devices, in which we went a trifle beyond our province and recommended 200 destroyers; I was the head of that. I do know about that.

The CHAIRMAN. The time between April 6 and June 25, when you became aid or assistant for Operations, do you know what procedure was followed in handling dispatches from Admiral Sims?

Capt. PRATT. Yes; I know that. The method was somewhat as follows: It was very poor. The communication between us and any officers we might have abroad followed a system which had been in vogue for a long time. It was this: It was more of a diplomatic way of doing things than what I should consider a practical way. Admiral Sims's cables came to the Office of Naval Intelligence. They were translated there—decoded—sent to the Office of Operations and there the reply was written out. This reply was then sent to the Office of Naval Intelligence, there coded, and if our codes, which at that time were not good, were not adequate, the reply was put into the P or Q code, which were British codes, and sent through the British officials,

from the embassy here to the foreign office, and there given to Admiral Sims—a very roundabout way. That was our system of communication as it existed when we went into the war. It was not efficient, and it was changed.

The CHAIRMAN. Were these dispatches from Admiral Sims circulated through all the bureaus and divisions concerned?

Capt. PRATT. That I can not say, sir. I managed to get hold of some of them, and I endeavored, whenever they were not given to me, to get in touch with every one of those cables that I could. I have since found—since we have reorganized the office—that some of those cables that Admiral Sims sent are missing. Previous to the time when we changed the system there seemed to be a lack of definite filing system, or something of that sort, so that I have been unable to get the consecutive numbers down to the A, B, C, the beginning of things, and to get a complete record.

The CHAIRMAN. When did you change the system?

Capt. PRATT. That date is a pretty hard thing to fix, but the idea of that really is due to Commander Ingersoll and Commander Carter. Very shortly after I came in they showed me the necessity of a more business-like way of doing things.

The CHAIRMAN. That is, after you came in as aide?

Capt. PRATT. And I acquiesced very readily, and the system was changed and developed. The exact date I can not say.

Senator BALL. Was it gradually put in?

Capt. PRATT. Gradually, as we could get the men. You can not disrupt an existing system at once; or, it is difficult to do it. But we established it, and it grew and expanded.

The CHAIRMAN. These dispatches were shown to you personally in all cases?

Capt. PRATT. I could not say whether I saw them in all cases, not, but I saw a great many of them.

The CHAIRMAN. To assist you in your work of planning?

Capt. PRATT. Oh, yes; oh, yes. I may say I was in touch with the situation, and I had ways of getting in touch which were outside of official channels.

The CHAIRMAN. But officially your duties were purely planning until June 25?

Capt. PRATT. Yes.

The CHAIRMAN. And in executing the plans also, in certain cases?

Capt. PRATT. Only those which were definitely given me to carry out; and, as I have said, I know three which I did carry out.

The CHAIRMAN. So that your duties were not exclusively planning but also the carrying out of the plans?

Capt. PRATT. Oh, yes; so far as I would be assigned to that duty by Capt. Chase.

The CHAIRMAN. I asked you about that. I believe in the original plan, the planning division was provided for and the duties of those who were in that planning section were purely to draw plans?

Capt. PRATT. Yes, sir; and I think everybody was in agreement of that, in theory. Practically, however, we were very short of men so much so that it was almost impossible—in fact, I think it was impossible—during the war, to set aside anybody of men whose functions or duty it was to deliberate alone. The only body that I know of that preserved that capacity was the General Board.

The CHAIRMAN. Purely the capacity of planning?

Capt. PRATT. Yes; of planning.

The CHAIRMAN. And their plans were lost. Do you know whether any special effort was made to take prompt and favorable action on these recommendations of Admiral Sims?

Capt. PRATT. I do not know what luck we might have. I tried personally very frequently, and would go with these cables, acting myself as a sort of nuisance, possibly, on the subject, to get this done. I have no doubt that we were all doing this. I think we were thoroughly impressed with the necessity of doing it; but not being the actual executive, I should hate to make a flat-footed statement, and say that I know that every one of these was carried out as strictly as a machine would operate.

The CHAIRMAN. But you do not recall any instances where you personally were in favor of holding up any of these recommendations of Admiral Sims?

Capt. PRATT. In favor of holding up? No, sir.

The CHAIRMAN. On the contrary, in every instance you were in favor, personally, of going ahead and following them out?

Capt. PRATT. I did not see anything to it except that the war was over there.

The CHAIRMAN. After you became aide for naval operations, you made a change in the method of handling Admiral Sims's dispatches?

Capt. PRATT. Yes, sir.

The CHAIRMAN. What was that change, substantially?

Capt. PRATT. The change may be spoken of as a double change. To my mind, the two most important things to successfully operate are, first the collection of information and its proper reception and distribution, which comes under the part you are speaking of now; but in order to be able to collect and distribute properly, the man who does the operating must constantly have before him either information tabulated, or graphically expressed, and must also have before him means at his right hand whereby he can translate the information instantly. So there was taken over from the office of Naval Intelligence that portion of its information which they had previously held in their files and which I called operating information. It was immediately taken over into the office of operations, and instead of being worked on the card-index system it was projected graphically into a visual system. Having this visual system before you, you then must be in a position to instantly project it out through our cables, in your communication system. So that, when we established the communication system, by taking over the communications from intelligence, we were likewise at the same time forced to develop the information system, let us say, and get that operating system right where we were in touch with it. So that is why I say it was a dual change. It would not have been complete by handling the cables alone, if you did not have immediate access to the information about which those cables referred.

The CHAIRMAN. Then, before you became aide or assistant for operations, these cables and messages came from Admiral Sims to the Chief of Operations, did they not?

Capt. PRATT. Not directly to him.

The CHAIRMAN. Were they not addressed to him, or to the secretary?

Capt. PRATT. Oh, they might be; but they would not go that way. I told you the system of communicating was a roundabout one. They might be addressed to the chief, but they came through what we called our more or less attaché system. They came by the foreign office. That is the way our foreign cables were handled, I think. Then, after being decoded, they came into Naval Operations and to the Secretary of the Navy by that rather roundabout way.

The CHAIRMAN. But no action could be taken on them in any case until they came to the Chief of Operations and the Secretary of the Navy?

Capt. PRATT. Oh, no, sir.

The CHAIRMAN. And I assume, as far as you practically could work in that roundabout way, they came as soon as possible to their notice?

Capt. PRATT. Yes; I think that is probably true.

The CHAIRMAN. At that period was any delay that you know of in answering those messages from Admiral Sims?

Capt. PRATT. I do not know definitely. In general, I would say that there would be bound to be delay in a cumbersome system.

The CHAIRMAN. What would be the system of answering them?

Capt. PRATT. That dispatch—say a dispatch from Admiral Sims—after having gone to Naval Intelligence and been translated, would come to Capt. Chase, I think. He would take it in to Admiral Benson. They would discuss it. Admiral Benson would come to whatever conclusion he chose to arrive at, and he would discuss it with the Secretary. The dispatch, whatever its nature might be, would be drawn up. It would be given to Capt. Chase, who would send it to Intelligence, and then it would go to Admiral Sims.

The CHAIRMAN. So that it would go back immediately after Admiral Benson gave it to Capt. Chase, or at least as immediately as would be possible under that system?

Capt. PRATT. Oh, I think so; yes, sir.

The CHAIRMAN. So that if there were any delay more than the reasonable delay that would occur under that system, it would be on account of the action taken by Admiral Benson and the Secretary of the Navy?

Capt. PRATT. Oh, yes, sir; if you will also add to that any reasonable delay which might be due to discussion of the subject.

The CHAIRMAN. Oh, yes; that would all be part of it. But I mean, it would be in their handling of the matter?

Capt. PRATT. Oh, yes.

The CHAIRMAN. After you went in, you provided for a shorter way of getting the cables and messages to Admiral Benson, and a shorter way of returning them after they had taken action, did you not?

Capt. PRATT. The shorter way lay in the communication system. I handled dispatches this way: Every morning before we opened business hours I had all the dispatches collected in the various books and laid out before me in the communication office. I went over each one of those personally, initialing them, indicating the line of action I wished taken, and then had them distributed immediately to the heads of the different business organizations we had there for their work.

Then the dispatches concerning policy and movements of ships I made notes on as to the action I advised, whether we could do it or

and all important ones I immediately took in myself to Admiral Benson, or, in his absence, to the Secretary of the Navy, advising immediate action or not, whatever the case might be. Now, all the work I did was almost entirely done through dispatches in order to get quick action.

The CHAIRMAN. Before June 25 do you recall any specific delays in answering the dispatches of Admiral Sims—the cables or messages from Admiral Sims?

Capt. PRATT. I would not be in a position to remember right now. There might be and there might not be. I should hesitate to say that at present, as I recollect to-day.

The CHAIRMAN. If I should later call your attention to some specific cases, you could identify them?

Capt. PRATT. Oh, yes.

The CHAIRMAN. After June 25th do you recall any specific instances of delays?

Capt. PRATT. I recall specific instances of delay and certain instances of disagreement. I know one. For instance, take the dispatch of the four battleships abroad. I think I prepared a favorable reply immediately, recommending that they be sent. That reply was not immediately sent, because the matter was under advisement between Admiral Benson and the Secretary of the Navy, but later —

The CHAIRMAN. Was any reply sent?

Capt. PRATT. Yes, sir; a reply was sent later, and it was not favorable.

The CHAIRMAN. But at that time no reply of any sort was sent to the recommendation?

Capt. PRATT. I think not.

The CHAIRMAN. Did you take up with the Secretary of the Navy personally any of these recommendations of Admiral Sims?

Capt. PRATT. Never, in the beginning.

The CHAIRMAN. Never prior to June 25?

Capt. PRATT. No; and after that I do not recollect of having personal dealings with the Secretary until Admiral Benson went abroad, in the fall. Those matters would naturally be conducted between Admiral Benson and the Secretary. There may have been cases, but I do not recall them. After the Admiral went abroad I did. I had occasion many times to take these dispatches into the Secretary personally. But before that, if I recollect correctly, my dealings were entirely with Admiral Benson, and he dealt with the Secretary.

The CHAIRMAN. And you never personally dealt with the Secretary of the Navy before you were made acting chief of Operations in the absence of Admiral Benson on his trip abroad.

Capt. PRATT. I can not remember when I ever did. I may have but I do not recollect it now.

The CHAIRMAN. You stated, I think, in your testimony that while you were acting chief of Operations there was no delay on the part of the Secretary in approving any plans.

Capt. PRATT. I know that.

The CHAIRMAN. Was there at any time, to your knowledge, any such delay?

Capt. PRATT. Why, that, sir, I think could better be answered by Admiral Benson himself.

The CHAIRMAN. I am talking about as far as you were concerned I am asking as far as you were concerned.

Capt. PRATT. You mean a delay in my doing my part of the job?

The CHAIRMAN. No; delay on the Secretary's part in not hurrying matters along.

Capt. PRATT. I am not exactly qualified to speak about that, I think.

The CHAIRMAN. There were none, then, that came under your personal observation? I ask you this because a number of witnesses have testified that they found it very difficult to get the Secretary to take action on important matters that were placed before him.

Senator PITTMAN. Mr. Chairman; I protest against this character of statement on your part. I do not think it is necessary to state that, that there are a number of witnesses that protested against the difficulty of getting action from the Secretary, because that is a conclusion which I positively deny, and which there may be considerable debate on. You have a habit of doing that, and you will pardon me for calling attention to it, but when it appears in the record in that way and goes undenied, it appears as an admission that such testimony does exist; which I deny to be the fact.

The CHAIRMAN. It is very easy to determine from the testimony. All I said was that it is contained in the testimony.

Senator PITTMAN. If the witness does not question the fact that there is that in the testimony, it goes as an admission that it is there.

The CHAIRMAN. I think the testimony bears that out.

Senator PITTMAN. I differ with you on that question; and that is entirely a matter of conclusion.

Capt. PRATT. What is the question that you want me to answer?

The CHAIRMAN. With regard to that particular point; I have asked you whether any specific instances came to your attention of a lack of promptness on the part of the Secretary in dealing with matters of importance that came before him.

Capt. PRATT. I do not know what difficulties, if any, Admiral Benson may have had. I am only qualified to speak of my dealing with the Secretary directly. I had heard all sorts of rumors, but when I came definitely to deal with him on certain specific plans I got an immediate decision. I can tell you one case, specifically. This is while I was acting Chief of Naval Operations. There were two cases in fact. Admiral Benson was abroad, and he sent a cable over recommending that the battleships be sent over. I handled it directly with the Secretary, and he approved it right off, and directed that Admiral Mayo be sent up in conference, in order to settle the details. I got a decision right off.

Another case was the case of the northern mine barrage. Capt. Belknap, who had worked the organization of the forces up very definitely, had reached a conclusion where it was necessary to have a final decision in the matter before we could proceed to carrying it into operation, because that meant projecting this body of ships and men abroad into European waters, and naturally, being a joint agreement, we had to get the Admiralty's approval to it. I went in with Capt. Belknap about 6 o'clock one evening, Admiral Benson being

abroad, and laid the question before him, and he approved it off.

CHAIRMAN. I will put in the record here some testimony that given by Admiral Palmer to substantiate what I said a few days ago.

ATOR PITTMAN. I will state that I have no objection to that; but it is perfectly proper in laying the foundation for such a question as you asked, to call attention to any evidence of that character by any particular witness, because that is a fact; but the statement that a great number of witnesses have testified to that fact, I think, is hardly the correct way of putting it.

CHAIRMAN. I did not say "a great number of witnesses." I said some of the witnesses had so testified.

ATOR PITTMAN. I think you said a number of witnesses.

CHAIRMAN. Yes; a number of witnesses.

ATOR PITTMAN. The only one you are putting in the record now is Admiral Palmer.

CHAIRMAN. Oh, no; I am also going to put in Capt. Laning.

ATOR PITTMAN. There is no objection to calling attention to any testimony that you want the witness to comment on so long as it is needed. I only objected to your making a statement which poses as a conclusion and not a statement of fact.

CHAIRMAN. Capt. Palmer's statement appears on page 1084 of the typewritten record. It was in regard to the recruiting of men for the Navy. Here is what he said [reading]:

"The chief of naval operations frequently said, 'It is probable you will have to man these ships of this kind, and you had better get the men for them.' The important thing for me to know was when those men would be required; and in each case operations were applied. 'We want them as soon as we can get them. We would like to have them now, or within a few weeks.' Of course, I knew we could not recruit men and equip them and get barracks for them in a few weeks. So that after one or two orders of that kind in regard to things that operations could not have foreseen the need of, I felt that it was up to me to be prepared for any operation they might have, and to take the responsibility of going ahead and working this organization into a production keeping it up to peak load all the time, so that I would be prepared for anything that might happen."

CHAIRMAN. And you took matters in your own hands and went ahead?

PALMER. Yes; I did. I did not do that, however, until after I had exhausted every other means to get the thing done.

CHAIRMAN. On the part of the Secretary?

PALMER. Yes, sir; I was forced—

CHAIRMAN. Did the Secretary give you any reasons for delaying the carrying out of the plan?

PALMER. Well, no reasons, of course, that appealed to me or appealed to people that were charged with personnel; but he would say, "We have no reserves now. We don't want any more."

Capt. Laning, on page 962 of the typewritten record, stated as follows [reading]:

"Coming on now to the fifth particular, it would be impossible to explain the situation just described without touching on a matter that I speak of only with great reserve and hesitation. I would not introduce it were it not essential to a clear understanding of the reasons why plans were not approved and why delays occurred in taking action on many important matters. But as the personal characteristics of men very often have profound effect on the organizations they direct, an understanding of those characteristics is essential to an understanding of the workings of that organization. In this case it was the personal characteristics of the Secretary of the

Navy that often made it impossible to get approval of the really important policies found this myself, and many others found it. If more information is desired on the point, I can give you the names of such officers.

Senator PITTMAN. I think that is very fair. It seems that there is a difference of opinion between the present witness and those other two.

The CHAIRMAN. It seems to me those quotations from the record bear out my statement.

Senator PITTMAN. Oh, your question stated that there were a number. I doubt if that means a number.

The CHAIRMAN. Let me read you what Admiral Plunkett says. Here is what Admiral Fiske says [reading]:

The officers try continually to make the enlisted man think we are his friends and not his overlords to too great a degree. Any question along that line, any personnel question, the Secretary was always glad to talk about, but he seemed to me to have a curious characteristic of not looking at the Navy as a whole. That impressed me at the time. For instance, for a long while after he first came into the Department the question of chaplains occupied him a great deal. But even that was not so much in regard to their connection with the Navy as the chaplains themselves and the effect of their teachings on the enlisted men, which, of course, was fine. But he never seemed to think about the Navy as a whole, and as far as I could make it out it has always seemed to me that he was always absolutely convinced in his own mind that there never would be any war. I found after a while that it was not a good thing to say anything to him about war. He did not seem to be ready to start on any subject connected with war at all.

Senator PITTMAN. He procrastinated about chaplains, as I understand it. That is a very serious matter.

The CHAIRMAN. The record speaks for itself. I think we will let it go at that. I think that shows that a number of officers did testify about the delay or inaction on the part of the Secretary.

Senator PITTMAN. Wherever he decided against them, apparently they called it procrastination.

The CHAIRMAN. I do not think the record will bear that out.

Capt. Pratt, after June 25, you consider that Admiral Sims's recommendations were answered promptly?

Capt. PRATT. Of course I did not always get a "yes."

The CHAIRMAN. Oh, no; but I am referring to attention being paid to his communications.

Capt. PRATT. Yes; I tried to—I paid attention to every one of his dispatches.

The CHAIRMAN. I do not think, Captain, that this question refers to you, at all.

Capt. PRATT. I know that it does not, but of course I have to think of what my part in it was, because I had to sort of outline it or did outline it, and sketch it out to my chief. So that I have to find out, myself, whether I have not been negligent in some way, and I have been trying to see wherein my negligence might lie, if such existed. That is, possibly, why I think it over a bit.

The CHAIRMAN. But I do not assume there was any delay, as soon as you received the communications, in submitting them to your chief?

Capt. PRATT. I suppose you want to know, when a specific thing came up, whether it was replied to immediately or not. I do not think I can tell you that, sir, with the great many dispatches that we had before us. I can give you far better my intent in the matter than I can a definite statement, with the thousand and one dispatches

it we had. Most of Admiral Sims's dispatches concerned his material needs which had to do with the bureaus. They were routed immediately to the bureaus, and I could not say after they passed out my hands whether they were acted upon or not. It went to them immediately, though.

Now, with regard to the plans that I had to do with myself, or the dispatches that I had to do with myself, it is difficult for me to say at this date, whether every one of those was answered. I know one thing. I can speak for myself. I did not keep Admiral Sims as fully in touch as I ought, and he used to kick at it a good deal, and I told him I just did not have time.

The CHAIRMAN. But that is a question of outside communication with him, is it not?

Capt. PRATT. Yes, it is; but we were trying to work together, hand in glove, to get things done, and so something may have slipped by.

The CHAIRMAN. As far as my recollection of the testimony goes - and I apologize to the Senator from Nevada for alluding again to the testimony - you did try in every way in your power to hasten along with the following out of the recommendations of Admiral Sims's?

Capt. PRATT. Yes; I wanted it done.

The CHAIRMAN. Admiral Palmer stated in his testimony that he knew nothing of Admiral Sims's early requests for personnel. Do you know whether these requests were ever referred to the Bureau of Navigation?

Capt. PRATT. No, sir; I do not.

The CHAIRMAN. You do not know?

Capt. PRATT. No, sir. What date does that refer to?

The CHAIRMAN. I think, to the first month of the war.

Capt. PRATT. I could not tell that. Some of those dispatches may have been lost, and they may have gone through.

The CHAIRMAN. Repeatedly, throughout the early months of the war, Admiral Sims was making requests for additional personnel on his staff in Europe?

Capt. PRATT. Oh, yes; he did that. It was not sent to him.

The CHAIRMAN. And it was not sent to the Bureau of Navigation?

Capt. PRATT. I do not know.

The CHAIRMAN. According to Admiral Palmer's testimony.

Capt. PRATT. I do not know that.

The CHAIRMAN. Admiral Palmer was Chief of Navigation?

Capt. PRATT. He would know. I do not know.

The CHAIRMAN. What general recommendations about matters on the other side, aside from Admiral Sims's recommendations, were received by the department?

Capt. PRATT. In the first month, I know nothing except through Mr. May and the testimony that has come up. Admiral Badger has testified, I think, that it was Admiral de Chair who was over here and made representations; but I did not see Admiral de Chair and had nothing to do with that conference. You see, it pretty much depends on how we got started right at the very beginning, because the war never took on, as far as the naval forces are concerned, any more than the general phase that it had at first - that is, the suppression of the submarine - and then for us on this side our more impor-

tant problems at home, the building up of our reserves, the getting everything ready to launch this huge army over in France; and in the main we relied on suggestions from Admiral Sims. When Admiral Grant, of the Royal Navy, was here in Washington——

The CHAIRMAN. That was at a much later period, though, was it not?

Capt. PRATT. Oh, much later. We used to talk things over nearly every day.

The CHAIRMAN. But prior to Admiral Grant's coming over, aside from what you got from Admiral Grasset and Admiral Browning when they were over here——

Capt. PRATT. Oh, we relied on Sims.

The CHAIRMAN. You relied entirely on Admiral Sims?

Capt. PRATT. Yes, sir.

The CHAIRMAN. And Admiral Grasset and Admiral Browning did not go very definitely into the submarine situation, did they?

Capt. PRATT. No; their point of view would be apt to be colored a good deal by conditions outside the war zone. Very frankly, I would consider that after a man had been outside of the scene of operations for any length of time his opinion would not be as good as that of a man who was sitting right on the job day by day.

The CHAIRMAN. However, Admiral Browning did speak in his statement he made at the conference of April 11 about the importance of the submarine situation?

Capt. PRATT. Yes; he may have had some direct instructions from the Admiralty which possibly he did not show to us.

The CHAIRMAN. But in his statement he did refer to the criticalness of the submarine situation, did he not? Were you at that meeting?

Capt. PRATT. No, sir; I have submitted a copy of the dispatch he sent, but I was not at that meeting. And, as I understand, at that meeting, and also, as Admiral Badger has testified, at the later meeting, that was talked over. I have not seen any minutes of it and am not conversant with it.

The CHAIRMAN. So that your principal knowledge about matters on the other side was clearly gotten practically exclusively from Admiral Sims?

Capt. PRATT. Oh, absolutely; almost entirely. He was our representative there and was sent there for that purpose, and I would like to say in addition there is no man I know of in the Navy who appreciates the value of information and its proper distribution to the extent that Admiral Sims does. He had had a tremendous experience once before, in the Spanish War, when he was sent over to Paris in very much the same capacity, and that, with his War College training, enabled him to appreciate to a degree that I really think no other leading officer in our Navy did, the value of information and its proper distribution. He built up a wonderful service, and I have often said myself that if Admiral Sims had not been there in London handling that service I do not know what we would have done. I have said it to myself, if I have not said it to others, many a time. It was a very wonderful information service which he created. Not only that, but he started other lines at work. For instance, the Admiralty began later automatically sending us all of their reports. Their letters call it their foreign office. They began sending us in

their pamphlets regarding the political situation throughout Europe. And, in fact, all over the world. Of course, those things were directed—or Admiral Sims had been instrumental in starting the flow of information. In fact, after that system began working we became the center of information collected from all over the world, and it was a very wonderful system that he created. Naturally we depended on him. We might from time to time receive direct information from the Admiralty, but it would be more of a specific nature—something that they wanted done. But, as the source of information, he was the head and shoulders of it. There is no question about that.

The CHAIRMAN. When he was sent over, he was not given any very specific plans to follow, was he?

Capt. PRATT. No, sir; and judging from myself, knowing the way we have worked together in the past, I should say he would not want to be handicapped.

The CHAIRMAN. That it was better for him not to be given specific instructions?

Capt. PRATT. That it was better for him not to have them?

The CHAIRMAN. But I assume when he was sent over he was informed of all the department's plans up to that date.

Capt. PRATT. That I do not know. That took place very quietly between himself and Admiral Benson. In fact, his going was absolutely secret. He dined with me the night before he left for New York, and he had a very broad smile on his face, and I knew that something was up, but he let me guess, and he would not tell me; so that what his instructions may have been I could not for the life of me say.

The CHAIRMAN. After he had gotten over on the other side and was performing his duties over there, if the department inaugurated any plans, it would have been proper to have kept him in touch, would it not?

Capt. PRATT. Oh, yes; yes, indeed.

The CHAIRMAN (continuing). With practically all the plans of the Navy that might in any way conflict with himself, over on the other side?

The CHAIRMAN. Was he in any way so informed?

Capt. PRATT. No; I do not think he was; and in that way I hold myself rather, very negligible, if I may say so. I did not keep Sims up to date the way I should, and he used to jump on me for it, and I would tell him, except as I would write a letter somewhat of the character of the one I submitted yesterday—he had to guess. But we were all brought up in the same school, all thinking along the same lines, and I always felt that Sims knew more about what we were thinking of than perhaps we did about what he was thinking about.

The CHAIRMAN. For instance, the Azores plan; he was not given any information of that?

Capt. PRATT. Well, that was not the plan——

The CHAIRMAN. About putting it into effect?

Capt. PRATT. He was supposed, just as any War College man would, to look at the chart. I will show it to you right here. He had one of these charts. We usually travel around with one. It is rather illuminating. (Exhibiting chart.) It helps to give you a good perspective of things. No War College man would have to

look at that more than about a minute to appreciate at once the strategic importance of the Azores; so that I do not believe it would ever occur to me to say to Sims—to try to impress upon him the strategic importance. I knew that he knew about it; knew about it better than I did.

The CHAIRMAN. But at least you would let him know if you were sending ships over, would you not?

Capt. PRATT. Oh, he knew we could not get those chasers and other things across that we were trying, without going to the Azores, in the wintertime. As a sailor man, he would know that. They did not have the capacity.

The CHAIRMAN. Yes, but I do not think he was informed, if I recollect rightly, when the Azores proposition was first established.

Capt. PRATT. You mean we did not tell him in time?

The CHAIRMAN. Yes.

Capt. PRATT. I dare say I did not. It would not surprise me at all if I forgot it.

The CHAIRMAN. You think it would have been better to have informed him?

Capt. PRATT. Oh, much; much! I omitted so many things of that sort. If I had just had more people to sort of help out, I would have done it in a minute. There was no intention to omit it, but I think there were many omissions of that sort, without doubt, which I hold myself very responsible for, and remiss in the matter.

The CHAIRMAN. In Admiral Sims' testimony it appears that prior to the end of June he received very few replies to his cables and messages, but that after that time he received replies much more promptly, and that, I take it, was due to the change that was made when you went in as aid or as assistant for operations.

Capt. PRATT. Well, I hope so.

The CHAIRMAN. Can you give any particular reason why the department failed before that time to answer to Admiral Sims' messages?

Senator PITTMAN. I object again. That is assuming that they failed to answer Admiral Sims' cablegrams.

The CHAIRMAN. If they did fail? Can you give any reason why they failed if they did fail?

Senator PITTMAN. That is better.

Capt. PRATT. You see, I am here testifying under oath, and I would like to testify to facts. I may, when I am not under oath, express a great many opinions, as most of us do; but I would rather you would ask that question of people that know. I do not know.

The CHAIRMAN. Then you do not know any reason why the department failed to act upon Admiral Sims' dispatches or to reply to them?

Senator PITTMAN. Do you know that they failed, in the first place?

The CHAIRMAN. If they so failed?

Capt. PRATT. I do not know, either way; either one way or the other.

Senator PITTMAN. That is absolutely essential to fairness of the question.

The CHAIRMAN. I am very willing to put it in, "if they did so fail."

Senator PITTMAN. All right.

The CHAIRMAN. You have read Admiral Sims' testimony. I take it?

Capt. PRATT. He knows. If he did not get answers, he knows whether he did not get them or not. If Admiral Sims says, "I did not get an answer to this," why, that stands; he did not get it.

The CHAIRMAN. And in cases where he says he did not get answers, do you know anything about the circumstances why he did not get an answer, or action?

Capt. PRATT. Oh, I may have guessed, yes, and I may have had opinions; but you are asking me now to state definite facts, and I do not like to state opinions where I should state facts. I think it is better for you to ask the people that actually handled those dispatches.

The CHAIRMAN. Will you give me the names, please, of the people who would know?

Capt. PRATT. Yes, sir; Admiral Benson would know; and Capt. Chase would know, but he is dead. Admiral Benson would know all about it; and I might guess a good deal about it, but I do not like to state guesses when I am under oath.

The CHAIRMAN. You prefer to leave the answer to that question to Admiral Benson?

Capt. PRATT. Oh, yes, sir; I would much prefer to leave it to him.

The CHAIRMAN. Admiral Sims and Mr. Hoover have both testified to the seriousness of the submarine menace during the early months of the war. Was that seriousness realized by the department from April to July, 1917?

Capt. PRATT. I realized it. I do not know whether anybody else realized it the same way that I did. It was realized after I came in as aid for Operations, because then I could talk to my chief, and I know he realized it then. And he is really the responsible man, and he can tell you how he realized it and what his attitude toward it was. I can tell you what my attitude was, and of course can tell you the absolute facts and truth in the matter. I thought it was so serious that, personally, I would have sent everything. I never had any other attitude than that.

The CHAIRMAN. Was that the general attitude in the department?

Capt. PRATT. Why, yes; it was from the time I came in, in an executive capacity; yes, I can say so.

The CHAIRMAN. No; that was June 25. I am referring to April and May.

Capt. PRATT. I can not say that.

The CHAIRMAN. It was talked over, was it not?

Capt. PRATT. Oh, it was discussed.

The CHAIRMAN. By all the officers?

Capt. PRATT. Oh, yes; by all of the officers.

The CHAIRMAN. Mr. Hoover returned early in April to this country and made a report of the seriousness of the situation?

Capt. PRATT. Yes, sir.

The CHAIRMAN. Were the officers of the Navy familiar with the fact that he had made such a report? Was that generally known?

Capt. PRATT. I think so. I will not say then, but later, I think Mr. Hoover and also the various members of different organizations that we had in this country, the various members who went abroad, and our communication system for the purpose of sending their

reports. I recall seeing a great many of what we called ship mission cables, and I think Mr. Hoover used that system later, and in a general way, I think we were all very familiar with Mr. Hoover's opinion in the matter. I know one officer, I can say quite definitely, who had exactly the same idea that I had on the subject, and that is my associate in the planning section, Capt. Schofield, because I was constantly in touch with him; we were working side by side; and we were very much impressed, from our studies, with the seriousness of the submarine menace.

The CHAIRMAN. We will suspend now until 10 o'clock to-morrow morning, Captain, and will you be here at that time?

Capt. PRATT. Yes, sir.

(At 1 o'clock p. m., the subcommittee adjourned until to-morrow, Friday, April 23, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

FRIDAY, APRIL 23, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, and Trammell.

TESTIMONY OF CAPT. W. V. PRATT—Resumed.

The CHAIRMAN. The committee will come to order. Capt. Pratt, yesterday I referred to Mr. Hoover's report of the seriousness of the submarine menace and asked you whether the fact that he had made such a report was generally known in the department, and in general whether the seriousness of the submarine menace was realized in the department, and you stated that you thought that the fact that Mr. Hoover had made such a report was known in the department.

Capt. PRATT. I think so, from general knowledge.

The CHAIRMAN. And the general seriousness of the situation was known at that time?

Capt. PRATT. I think it was known after Admiral Sims sent his report in to us. I very much doubt if we fully realized the seriousness of the situation until his original cables were received, because while I was not at that time in an executive capacity, yet I knew that the British were not telling us all they knew until after we came into the war; so, therefore, the information that we might get at the very beginning from them on that subject, would be most guarded. But I can not see how anyone would fail to realize the seriousness of the submarine situation after the first cables from Admiral Sims were received.

The CHAIRMAN. And the first cable was April 14, was it not?

Capt. PRATT. Yes. I have not my personal files with me, but I had sent to me later that cable complete, and I have a very distinct recollection now that I was very fully impressed with the seriousness of that situation very soon after we entered the war.

The CHAIRMAN. Admiral Sims's cable of April 14 deals with this question?

Capt. PRATT. Yes. I have a personal copy of that; not an official copy.

The CHAIRMAN. Then, if the seriousness of the situation was realized even as early as April 14, why was there such a delay as there was in sending antisubmarine craft to the other side?

Capt. PRATT. That I can not tell you definitely, sir, if there was a delay. The best I can state on that subject is this: I have submitted in my original testimony the numbers of destroyers that were in Europe, and in that table of April 6, 1918, the exact date of sailing of every ship that went over, so that that is all I can speak of as to facts. I do know, however, from my knowledge of the condition of ships—that is, antisubmarine craft—that there were only three yachts at that time with real capacity for going—that is, the *Yankton*, the *Scorpion*, which was interned at Constantinople, and the *Mayflower*, the President's yacht. The dates when the destroyers sailed speak for themselves. Those are facts. Anything else I could give would be merely a matter of opinion.

The CHAIRMAN. You have not stated in your testimony, as I recollect it, that there were no delays in answering Admiral Sims's cablegrams.

Capt. PRATT. Oh, no; I have not said that. I do not know. Every way that I could possibly take, myself, I endeavored to have expedited; but I could not say after they passed out of my hands what happened.

The CHAIRMAN. Admiral Sims stated in his testimony that all of the vessels sent to European waters up to March 1, 1918, should have been available in April, 1917.

Capt. PRATT. No, sir; that——

The CHAIRMAN. For what reasons were they not sent? Were they available?

Capt. PRATT. No, sir; that is a mistake. If I had that list before me I could even point out one by one, almost, why they were not; but, generally speaking, we had to get a lot of yachts, and at the very beginning, before the commandeering bill was passed, we had to depend very largely, to a certain extent, on gifts—people gave outright, and they sold, and those craft were fitted out as soon as it was possible for them to go. We could not get any tugs given to us, and when the commandeering bill was passed, I think it was June 15, that put more power in the hands of the Navy Department, and they were able to get many more smaller craft, which were not available at first.

The CHAIRMAN. But if all the vessels that were sent to Europe by March 1, 1918, had been thoroughly equipped, thoroughly ready in personnel and in material on April 6, could not those vessels have been sent over during the month of April?

Capt. PRATT. Oh, if we had foreseen to the extent of commandeering them and getting them ready.

The CHAIRMAN. Aside from commandeering? I am referring to the vessels of the Navy now.

Capt. PRATT. Let me get that list out and look over them one by one, and then I can just point out the vessels that we had to take. [Examining list of April 6, 1918.] Now, apart from the material condition and personnel condition, which I will assume has been rectified before April 6, 1917——

The CHAIRMAN. Apart from what?

Capt. PRATT. Apart from the material and personnel conditions, which I assume, according to your statement have been perfected, and that they are all ready to sail, I will try to point out those vessels

side of the Navy which we would not have been able to get unless the act had been passed. Running down the list——

The CHAIRMAN. I am asking you more especially, Captain, about the vessels of the Navy.

Capt. PRATT. That is just what I am trying to answer, but in order to do it I have to take the list of April 6 and go right down and scan, in my mind, and sort them right out, in order to give you a total; don't you see, sir? There should have been, providing we could have withdrawn from the neutrality duty which some of our destroyers were on—the exact number I do not know, but I think about 20, this duty having been continuous for some time in and around the port of New York and the principal ports, inspecting all vessels and following them out to see that our neutrality laws were not violated—I say that if they had been available to go immediately across and had been removed from this neutrality duty, then we should have had about 51 destroyers, about 6 tenders for the destroyers, about 7 gunboats, 2 cruisers, and about 12 submarines.

The CHAIRMAN. These are all of the vessels that went over before March, 1918, which would have been available on April 6, 1917, if they had been all ready?

Capt. PRATT. If they had been put in shape; oh, yes. They belonged to us.

There also would have been available 5 coast guard cutters. Now, there are a number of ships mentioned on this list which would not have been available because we took them into service from outside sources; yachts, fishing craft, and so forth. That number foots up to about 27 yachts, about 12 tugs, and about 4 mine sweepers that would not have been available.

The CHAIRMAN. Those were vessels that were not in the Navy?

Capt. PRATT. No, sir; not in the Navy.

The CHAIRMAN. But of the vessels that were in the Navy at that time, how many could we have had over in April, 1917, had they been prepared in material and personnel, and ready to go at once?

Capt. PRATT. I gave you the list, sir; I gave them. I specified the types and the numbers; 5 coast guard cutters, 12 submarines, 7 gunboats, 6 tenders for destroyers, and 51 destroyers.

Senator KEYES. Did you not mention 2 cruisers, in your first statement?

Capt. PRATT. Oh, yes; I did; the *Birmingham* and the *Chester*.

The CHAIRMAN. Why were those vessels not sent in April?

Capt. PRATT. That, sir, I do not know.

The CHAIRMAN. Those of the regular Navy?

Capt. PRATT. That I do not know.

The CHAIRMAN. But they were not?

Capt. PRATT. They were only sent as I specified in the list, which shows the numbers that were sent, the dates of sailing on this list, the date for each ship being given, when it left, and when it arrived.

The CHAIRMAN. Yes.

Capt. PRATT. So that the record is perfectly clear. That is fact. That, of course, I can testify to. But why they were not sent, I do not know.

The CHAIRMAN. I think that the record shows, does it not, that of the 51 destroyers only 6 were sent over in April?

reports. I recall seeing a great many of what we called ship m cables, and I think Mr. Hoover used that system later, and in a eral way, I think we were all very familiar with Mr. Hoover's op in the matter. I know one officer, I can say quite definitely, wh exactly the same idea that I had on the subject, and that associate in the planning section, Capt. Schofield, because I was stantly in touch with him; we were working side by side; ar were very much impressed, from our studies, with the seriousness the submarine menace.

The CHAIRMAN. We will suspend now until 10 o'clock to-m morning, Captain, and will you be here at that time?

Capt. PRATT. Yes, sir.

(At 1 o'clock p. m., the subcommittee adjourned until to-m Friday, April 23, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

FRIDAY, APRIL 23, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, and Trammell.

TESTIMONY OF CAPT. W. V. PRATT—Resumed.

The CHAIRMAN. The committee will come to order. Capt. Pratt, yesterday I referred to Mr. Hoover's report of the seriousness of the submarine menace and asked you whether the fact that he had made such a report was generally known in the department, and in general whether the seriousness of the submarine menace was realized in the department, and you stated that you thought that the fact that Mr. Hoover had made such a report was known in the department.

Capt. PRATT. I think so, from general knowledge.

The CHAIRMAN. And the general seriousness of the situation was known at that time?

Capt. PRATT. I think it was known after Admiral Sims sent his report in to us. I very much doubt if we fully realized the seriousness of the situation until his original cables were received, because while I was not at that time in an executive capacity, yet I knew that the British were not telling us all they know until after we came into the war; so, therefore, the information that we might get at the very beginning from them on that subject, would be most guarded. But I can not see how anyone would fail to realize the seriousness of the submarine situation after the first cables from Admiral Sims were received.

The CHAIRMAN. And the first cable was April 14, was it not?

Capt. PRATT. Yes. I have not my personal files with me, but I had sent to me later that cable complete, and I have a very distinct recollection now that I was very fully impressed with the seriousness of that situation very soon after we entered the war.

The CHAIRMAN. Admiral Sims's cable of April 14 deals with this question?

Capt. PRATT. Yes. I have a personal copy of that; not an official copy.

The CHAIRMAN. Then, if the seriousness of the situation was realized even as early as April 14, why was there such a delay as there was in sending antisubmarine craft to the other side?

Capt. PRATT. I can only tell you, sir, what I would do myself if I had wanted to get those boats——

The CHAIRMAN. I am not asking you that. I am asking you if they were ready, if they were available at that time, so far as personnel is concerned.

Capt. PRATT. But I have got to make a little bit of an analysis in order to answer your question honestly. That is what I am trying to do. If I had wanted to send those boats over then, I would have gotten them fit, and I would have taken men off the battleships and put them on and sent them. Yes, we could get personnel and cut down something else; put them on the boats. It is a question of adjustment.

The CHAIRMAN. As long as you are saying what you would have done, in that case if you had wanted to send them over, what do you think——

Capt. PRATT. Do I think it could have been done?

The CHAIRMAN. Would you have sent them over?

Capt. PRATT. I would.

The CHAIRMAN. In April?

Capt. PRATT. Yes, sir.

The CHAIRMAN. What was the policy of the department in the early months of 1917—January, February, and March—with regard to the dreadnoughts and the main fighting forces of the Navy?

Capt. PRATT. I do not know, sir. That is before I came in. I can not tell you.

The CHAIRMAN. Part of that time you were in the planning section?

Capt. PRATT. I was in the planning section a part of that time. I was also in the War Department—in the Army War College. I did not go to the Navy Department until 1917, until about February. I was out of it altogether.

The CHAIRMAN. So that in January you were in the War College?

Capt. PRATT. I was in the Army War College.

The CHAIRMAN. So that you have no knowledge as to the policy of the department at that particular time, as to the dreadnoughts and the main fighting force?

Capt. PRATT. No, sir. I think Admiral McKean can answer that far better than I can.

The CHAIRMAN. You do not know at that time whether there was a plan to use these ships in case we went into war, to defeat the Germans, or whether we were contemplating holding them back in case we had to meet the Germans after they had met the British fleet?

Capt. PRATT. Why, I know what the policy was which we wrote in a letter, because I wrote that letter. But in my own mind, I discounted the question of our fleet having to engage the Germans.

The CHAIRMAN. What is the date of that letter you refer to?

Capt. PRATT. July 3. That is the fixed-policy letter in which we stated——

The CHAIRMAN. No; I was asking you about the policy during January, February, and March, before we had gone into the war.

Capt. PRATT. Oh; and I said, sir, I can not tell you.

The CHAIRMAN. You do not know anything about it?

Capt. PRATT. I do not know anything about that.

The CHAIRMAN. Then, I am not referring in any way to your letter that you wrote at a subsequent date. That had nothing to do with it.

complement basis. But I do note a few exceptions to that, were they had not been on March 31 raised to the war complement. For instance, one boat here I note right away is the 750-ton oil burning destroyer, having a complement on 1 of 60. She should have about 94.

CHAIRMAN. How many of them, then, were not in condition as personnel was concerned, on April 6, 1917?

PRATT. I will count the number up. My table does not April 6 but on March 31, which is pretty close to it.

According to the figures, when I go over it in detail, I should say 30 were not up to full complement. Their complements had decreased from what they were on January 17, but about 20 were at full complement, to my mind.

CHAIRMAN. Leaving, then, how many that were in full complement as to personnel?

PRATT. Well, the difference between 20 and 51.

CHAIRMAN. Thirty-one?

PRATT. I should say, roughly.

CHAIRMAN. Those were all destroyers of 750 tons?

PRATT. Or greater.

CHAIRMAN. Or over?

PRATT. Yes, sir.

CHAIRMAN. There were also a few smaller ones, were there not?

PRATT. Yes, sir; there were about 16 of 400 tons. They were light craft, and we never did get more than those that came—those that came around by Asia got in, and later, I think, we got in as the Azores.

CHAIRMAN. So that there were substantially 31 destroyers at the the beginning of the war that could have been sent during the month of April, 1917, if it had been deemed advisable to send them?

PRATT. That is the way it appears to me.

CHAIRMAN. And how long would it have taken to put the boats that were not fully filled up as to personnel into commission, as personnel was concerned?

PRATT. I do not quite understand you. Which others do you mean?

CHAIRMAN. Those vessels that did not have the full complement—them—the destroyers that did not have the full complement.

PRATT. Why, it seems to me that if I had wanted to get them and have them, I should have had the whole 51 ready to go at that time.

CHAIRMAN. Within a few days?

PRATT. As far as personnel was concerned.

CHAIRMAN. As far as personnel was concerned?

PRATT. I would have found it.

CHAIRMAN. What?

PRATT. I would have found it. I would have gotten it.

CHAIRMAN. So that, so far as personnel is concerned, the 51 boats that were over by March 1, 1918, could have been sent April, 1917, if it had been deemed advisable by the department to send them over?

Capt. PRATT. That matter, sir, lies between the Chief of Naval Operations and the Secretary. The cable was handled immediately. That is, a favorable answer was prepared, as I think I stated in my testimony. It was held up for discussion between Admiral Benson and the Secretary, and between them they made the decision not to send them.

The CHAIRMAN. I think you stated in your testimony that in all cases where cables came over, as far as you were concerned, there was no delay in transmitting them to the Chief of Operations and to the Secretary?

Capt. PRATT. No, sir; as far as I can remember, I do not know of a delay.

The CHAIRMAN. And when the reply came from the Chief of Operations and the Secretary, there was no delay then in sending the reply back to Admiral Sims?

Capt. PRATT. No, sir; I know that, because I frequently wrote the replies, and if I got an O. K. on it I shot it out immediately.

The CHAIRMAN. And the delay, if there was any, therefore, would have been either on the part of the Chief of Operations or on the part of the Secretary?

Capt. PRATT. If you call it a delay, sir, yes.

The CHAIRMAN. I say, if there was any delay.

Capt. PRATT. If there was any delay, it is there.

The CHAIRMAN. Or any trouble in not answering letters.

Capt. PRATT. Well—

The CHAIRMAN. You could not answer the letters yourself, could you Captain?

Capt. PRATT. I would have answered them.

The CHAIRMAN. No, no; I say these messages that came from Admiral Sims to the Chief of Operations or to the Secretary had to be answered by them? It was not within your province to answer them?

Capt. PRATT. Only to write them.

The CHAIRMAN. Only to write them after you received orders to do so.

Capt. PRATT. Yes, but let me clear that up a little further. We did not do much business by letter. Things moved too fast.

The CHAIRMAN. The same applies to the cables?

Capt. PRATT. Oh, yes. It was almost all transacted by cable; and as I explained my method of doing business, yesterday, those cables were indorsed, recommending action to be taken, and those things were settled before business hours of each current day, and they went in immediately.

The CHAIRMAN. Yes, but there were many requests made by Admiral Sims where there were no replies made to them, and no attention paid to them, as far as he knew.

Capt. PRATT. The admiral has not made a very clear distinction, when he says "requests," as to what he means. Now, some of those requests, if they concerned material things, would go directly to the bureaus for action. If, in his requests, he means plans and policies and operations, they went directly to the Chief of Naval Operations and then to the Secretary; so that is a fairly large blanket statement. We have got to make a distinction between the two.

The CHAIRMAN. For instance, Admiral Sims wrote on April 14th—
wrote or cabled—

Capt. PRATT. Yes.

The CHAIRMAN. Cabled, I think, and again on April 23rd, on April 29th, and on May 8th, and on May 24th, in each case asking for tugs to be used on the other side. No answer was received from the department until August 8th. That would look like somewhat of a delay, would it not?

Capt. PRATT. Oh, yes; that would be a delay in answering. But about tugs along—

The CHAIRMAN. I am not asking about the merits of sending them over; I am asking now about the question of delay in attending to the request, or giving information about sending them.

Capt. PRATT. Some of those cases, of course, when it comes to details, I hold myself responsible for not giving Admiral Sims as full information as he gave us. I tried to do what was humanly possible in keeping him informed, but I have no doubt that I made many slip-ups.

The CHAIRMAN. But, Captain, I do not think that you had anything to do with it. It looks to me as though he made requests for certain things and it rested with the department as to whether they would grant these requests, and the department, of course, would act through the Chief of Operations and through the Secretary?

Capt. PRATT. Certainly.

The CHAIRMAN. And until they acted you would have no authority to follow out the admiral's recommendations, would you?

Capt. PRATT. Well, I had a good deal to do with advice; and I can tell you about the tugs. I advised not sending the tugs.

The CHAIRMAN. My point is the lack of information to Admiral Sims, the lack of answer to what he asked for, whether it was a favorable or an unfavorable answer.

Capt. PRATT. Yes; of course. Speaking theoretically, and as we would be able to handle business to-day in times of peace, yes, he ought to get it; but those were pretty strenuous times, and no doubt a lot of the information he wanted and should have had he did not get; even though we wanted to give it to him and meant to give it to him.

The CHAIRMAN. I asked you about the refusal or delay as to sending a division of coal burning dreadnoughts to reinforce the Grand Fleet.

Capt. PRATT. Yes.

The CHAIRMAN. Can you explain that?

Capt. PRATT. No, sir; I can not explain it other than to state what I already have stated, that that matter rests between the Secretary and the Chief of Naval Operations.

The CHAIRMAN. Do you know what led to the department's change of attitude in this matter in November?

Capt. PRATT. Oh, yes; the admiral went over himself, and when he got there he saw what the situation was, himself, and then he sent a cable over. On receipt of that cable I took it in to the Secretary. He approved it and the ships were made ready and sent.

The CHAIRMAN. Thus bearing out the advice Admiral Sims had sent over many months previously?

Capt. PRATT. Absolutely.

The CHAIRMAN. They did not insist on getting all the details; they made their decision in any cases that you recall?

Capt. PRATT. No—well, yes; I may have to modify that. He was given a free foot in the execution of it; but explanation was asked. Really, until the Plans Section was established over in London I do not remember of a single what you call a clean-cut plan that Admiral Sims ever sent over to us. I knew thoroughly what he meant. It was just as good, for my own purposes, as though he had written the most theoretical plan in the world. I knew that he wanted ships, I knew he wanted a particular kind of ship: and it was our idea to send them over to him, and when they went over to him he should use them where it was best. I think a great many explanations probably were asked of him.

The CHAIRMAN. Before the decision was made. Now, take up the convoy question. The Allies decided on adopting the convoy plan on May 1, 1917. Admiral Sims's cables reads as follows. [Reading.] Sent: May 1st, 1917.
To: Secretary of the Navy.

British admiralty has decided to give trial to the convoy scheme described in my last dispatch. Instead of present plan of naval forces operating independently against raiders, there will be a high sea convoy against raiders, such convoy to be established as quickly as possible on all main trade routes, and on approach to dangerous areas on this side, will be met by destroyers and escorted into port. Hampton Roads and New York have been proposed as assembly ports for eastbound vessels on our coast and gulf, with convoys sailing every fourth day. Plan decided on after long consideration by Admiralty and War Council, and is considered absolutely necessary. It will strain British resources of personnel and ships to the limit, and we must agree by taking one route, at least, if the plan is to be carried out. Admiralty desire to be informed whether we can provide escorts for convoys sailing from the rendezvous at New York. British estimate about 14 ships will be required for New York service, and larger numbers for other routes, including Mediterranean and South America. Escorts should have sustained sea speed of at least 12 knots and six inch guns. I very urgently recommend favorable action. Through British Naval representative at Washington details of plan will be communicated from time to time as necessary.

Sims.

The Admiral then said:

"I received no answer to the message I had sent on the 1st of May, and in fact no communication whatsoever from the Navy Department with regard to the convoy proposal until June 20th, nearly two months later."

In this letter of June 20 the Secretary stated:

In regard to convoy, I consider that merchant vessels having armed guards are safer when sailing independently.

Now, can you tell me why the Department delayed so long in putting the convoy system in operation in cooperation with the Allies?

Capt. PRATT. I think it was because they thought they had a perfectly legitimate right to discuss a question of that magnitude, in which the whole plan of operations was being changed from one system, that of patrol, to another, that of convoy, especially as our movement later on across the ocean was bound to be a very large one. I think it was largely a question of discussion. I know that at the very beginning we looked upon convoy rather askance until the British had proven it—we had a definite system. After, I think it was, May 31st, if I remember the cables, when they reported the first convoy arrived safely (I think Admiral Sims has reported so), it was definitely accepted, I said July 5th, but I think it was about

d. Anyhow, it was along in the first part of July; and during the department was balancing the problem. It was not, a British problem alone. It was more or less of a combined

CHAIRMAN. That is, they were studying the details before making the decision?

Capt. PRATT. I think so.

CHAIRMAN. And they were not ready to accept the decision by the forces on the other side or by the Allied Council?

Capt. PRATT. Why, I think that is a sensible view to take, sir, on that movement of that sort.

CHAIRMAN. Did not the convoy system have a good deal to do in meeting the submarine menace?

Capt. PRATT. Oh, yes; it was a success. But, like many things which proved to be successful, hindsight is a great deal better than sight.

CHAIRMAN. But would it not have been a good thing if we had have adopted it earlier than we did?

Capt. PRATT. Yes; it would have been a good thing.

CHAIRMAN. That is also true of the question of sending destroyers over to the other side, is it not?

Capt. PRATT. Yes.

CHAIRMAN. It is also true of the question of sending officers over to assist Admiral Sims?

Capt. PRATT. Yes.

CHAIRMAN. If that is true, and it would have been a good thing to comply with these recommendations of Admiral Sims when he made them, instead of several months later, as the department did do, would not that have had a material effect in checking the submarine menace earlier than it was checked?

Capt. PRATT. Well, I have made a calculation of figures as well as could. It would have helped, but I do not believe that we were prepared at that time to have had as much effect on the submarine menace as perhaps we thought we had. The spirit should have been there though to help all we could, but the actual material advantages or disadvantages I do not believe are as great as we thought.

CHAIRMAN. That is, you do not believe that it would have shortened the war by four months?

Capt. PRATT. Oh, no, sir; I feel perfectly satisfied it would not.

CHAIRMAN. Do you think it would have shortened it three months?

Capt. PRATT. No, sir.

CHAIRMAN. Or two months?

Capt. PRATT. No, sir; I do not.

CHAIRMAN. Or a week?

Capt. PRATT. No, sir.

CHAIRMAN. Or a day?

Capt. PRATT. No, sir.

CHAIRMAN. Therefore you say that what we did over there in relation to the submarine menace had nothing to do with shortening the war?

Capt. PRATT. That is what I mean to say.

CHAIRMAN. Now, our Navy took an active part in the war, did they not?

Capt. PRATT. Yes; we took an active part.

The CHAIRMAN. What did they do?

Capt. PRATT. We sent craft over to operate against the submarine and we sent our battleships over, and our shore activities, before we finished, were quite great.

The CHAIRMAN. That is, the big 14-inch guns?

Capt. PRATT. Yes; and we built a radio station over there, and Admiral McKean can tell you; we put up some oil tanks, and we ran an oil-pipe line across Scotland for the use of the Grand Fleet.

The CHAIRMAN. Would you give that as the main activity of the Navy during the war?

Capt. PRATT. No, sir.

The CHAIRMAN. The shore work?

Capt. PRATT. No, sir. Our main activities were in two things—the transporting of troops across, I believe, stands as the major naval effort of the war. That is my opinion.

The CHAIRMAN. The transporting of ships across?

Capt. PRATT. Of troops across.

The CHAIRMAN. Of troops across?

Capt. PRATT. Yes, sir; I believe that is the major effort.

The CHAIRMAN. Including the transport of cargoes to feed them?

Capt. PRATT. We had not gotten into that in force yet. We were only beginning to arrive when the armistice was signed. The major effort was in troops, and during the critical months of 1918—this is my recollection—I used to attend some of the conferences in the War Department, and the British officers seemed to be quite insistent that we should get the troops across and they would look out for the supplying of them for a limited period of time if it were necessary to do so.

The CHAIRMAN. They could not have supplied them, with the food conditions as they were in Europe, for any material length of time without our assistance?

Capt. PRATT. I do not think they planned for any material length of time, but what they wanted was men, right then and there.

The CHAIRMAN. I know, but men have got to be fed.

Capt. PRATT. So they have, but in 1918——

The CHAIRMAN. And were not the Allies sending over largely for troop supplies when they got over there?

Capt. PRATT. Naturally, of course, they were. But you can pull your belt in a notch.

The CHAIRMAN. Then the feeding of those men was all a part of the general submarine situation, was it not?

Capt. PRATT. Oh, yes; but all I am trying to say is that, at a pinch, you can do a little less, and the first concern was men.

The CHAIRMAN. Yes; but is not the transportation of troops directly connected with the handling of the submarine menace?

Capt. PRATT. Just what do you mean?

The CHAIRMAN. Why, these troop transports, I suppose, were liable to attack by submarines, were they not?

Capt. PRATT. Yes; they were.

The CHAIRMAN. And the sending of ships over to that side to assist in the putting down of the submarine menace was also an assistance in the sending of troops over, was it not?

Capt. PRATT. Of course, it was an assistance. I have never for one minute tried to say that it was not of assistance.

The CHAIRMAN. It was of material assistance, was it not?

Capt. PRATT. Well, it was in proportion exactly as the ratio of the numbers we could send to the total numbers on the spot. We can not claim more than our share. I would like to claim it all if I could, but I can not do more than the figures show me is there.

The CHAIRMAN. After the 1st of July we had 31 destroyers over there, did we not?

Capt. PRATT. If you want the exact number I will have to get down to my papers.

The CHAIRMAN. That can be verified from the record. I thought it was 31.

Capt. PRATT. I will assume that that was exactly what we had, 31, if that was what it was, yes.

The CHAIRMAN. I think on June 11, 36 destroyers had arrived on the other side.

Capt. PRATT. Yes.

The CHAIRMAN. The testimony has shown that there were a large number of vessels used against submarines?

Capt. PRATT. Yes.

The CHAIRMAN. That includes in that list something like 1,400 by all of the Allies?

Capt. PRATT. I figured it out as about 1,700. Well, say 1,400.

The CHAIRMAN. Fourteen hundred or more?

Capt. PRATT. Fourteen hundred or more, yes.

The CHAIRMAN. Of course, those were not all destroyers. That included vessels of all kinds?

Capt. PRATT. Yes; of course it did.

The CHAIRMAN. But the destroyers were the most effective in the submarine operations, were they not?

Capt. PRATT. Yes, absolutely; but the number of destroyers we had compared to the number that Great Britain could bring to bear, and the French plus the Italians, was not very great. They had 111 with their grand fleet alone.

The CHAIRMAN. Yes; but those were not used against the submarines?

Capt. PRATT. That is just exactly it. You have hit the nail right on the head, there. If it was as strenuous as all that, why did they not use them against the submarine?

The CHAIRMAN. Because, I suppose, they had to keep the German fleet cooped up, and without those destroyers their fleet would have been in the same condition as our fleet would have been in if we had gone over in 1917 against the German fleet.

Capt. PRATT. There is the hitch, right there. The British grand fleet thought one thing, and they held a lot of destroyers up above there, that we always felt and believed they ought to have shot down and used in antisubmarine work.

The CHAIRMAN. They could not do it. They had to protect their fleet.

Capt. PRATT. I would have done it if I had had the doing of it.

The CHAIRMAN. And you would have left your fleet without protection?

Capt. PRATT. If it was as dangerous as all that—the submarine. But, they, in sizing the situation up, did that. That is what makes

me think that the British Admiralty—they are pretty wise old birds—knew what they were doing. They wanted us to come in and do all we could.

The CHAIRMAN. Was it not to their interest to keep the British fleet in the best possible fighting condition in case the German fleet came out?

Capt. PRATT. Yes, but a little later on an idea began to crop out, and I know it got into our plans department, that the British were a little too apprehensive of that fleet coming out; and in the light of events, of what did happen, they were altogether too apprehensive. They scared the Germans pretty thoroughly in the Battle of Jutland, together with the demoralization which set in of the German navy, they had them whipped before they knew it.

The CHAIRMAN. But if the German fleet had known the British fleet was lacking in some of its principal component parts, it might have attacked?

Capt. PRATT. I do not know whether they would have taken the chance.

The CHAIRMAN. What I wanted to say was in regard to the submarine, that in proportion, the assistance we gave in putting down the submarine menace was far greater than the proportion of 36 to 1,400?

Capt. PRATT. If that is what you mean, I have got enough pride in our own boats to say that I will make the proportion, destroyer to destroyer alone; I mean our destroyers to the total destroyers of the Allies on the other side.

The CHAIRMAN. And even at that, our destroyers were probably in better shape than the destroyers of the French and the other allies.

Capt. PRATT. They were, and for this reason, I think. Great Britain and the French and Italians were war weary, and they had lost a lot of their men, and they had to cut down the crews of their boats, and we came over with our destroyers, with our picked men on them. You could not find a better lot. And boat for boat, they did just as much as the other man, and I believe a little more.

The CHAIRMAN. So that our forces over there were really of material help in putting down the submarine menace, whether or not they had anything to do with shortening the war, were they not?

Capt. PRATT. Yes; they contributed.

The CHAIRMAN. And you say that our greatest naval effort was the protection of troops going over?

Capt. PRATT. Transporting troops. That is my opinion, merely, alone. If I was asked for an opinion, I would say that that was our greatest achievement.

The CHAIRMAN. You do not include the provisioning of the troops?

Capt. PRATT. We had not gotten into that, in full force. The Navy had not gotten hold of the supply ships in the numbers that were beginning to flock in when the armistice came.

Senator KEYES. It was necessary?

Capt. PRATT. Oh, absolutely necessary.

The CHAIRMAN. But we were sending large amounts of supplies abroad at that time?

Capt. PRATT. Yes; and many of those supplies, as I think the records will show, went in British bottoms—in British ships.

The CHAIRMAN. So that you do not give us any particular credit for that?

Capt. PRATT. Well, I wish I could. I wish our merchant marine had been built up there, so that we could have done it all. We were coming, but we had not yet arrived.

The CHAIRMAN. But at least we did our part in protecting those British ships that were sent over with supplies?

Capt. PRATT. Yes; trying to.

The CHAIRMAN. Yes; and the Navy did that?

Capt. PRATT. Yes.

The CHAIRMAN. And you think that was an important part of taking care of the armies on the other side?

Capt. PRATT. Yes; an important part.

The CHAIRMAN. And that we did?

Capt. PRATT. Protecting——

The CHAIRMAN. We contributed largely to that by putting our antisubmarine forces at work? We contributed largely to the sending over of supplies by sending our antisubmarine forces to the other side?

Capt. PRATT. No, sir; the antisubmarine forces, unless I misunderstand you, did not contribute to getting the supplies across.

The CHAIRMAN. To the sending of them over safely?

Capt. PRATT. They helped to protect the supplies.

The CHAIRMAN. That is contributing to getting them over, is it not?

Capt. PRATT. Looking at it that way; yes.

The CHAIRMAN. I asked you about the convoy system. When was serious consideration first given by the department to the convoy system?

Capt. PRATT. I think that the question was taken under discussion immediately Admiral Sims' telegram was received.

The CHAIRMAN. Of May 1?

Capt. PRATT. Yes; I think it was being discussed right along, and the pros and cons of the matter weighed.

The CHAIRMAN. And when was it first put fully into effect, requiring all ships sailing from American Atlantic ports to establish and join convoys?

Capt. PRATT. That did not lie within our province. The part we took was to furnish the cruisers they asked for. The system was entirely of British inception, handled by their own methods and by their own people, and they had their own officers in our ports. What they wanted from us was the contribution of a certain number of cruisers so that no convoy would leave a port without having a cruiser to guard it.

The CHAIRMAN. Did they not also want us to agree to have our ships go according to the convoy plan?

Capt. PRATT. Yes; they wanted to; and, in general, we were willing to do that, but——

The CHAIRMAN. What I want to know is when we decided to do that?

Capt. PRATT. We acceded on July 5.

The CHAIRMAN. July 5?

Capt. PRATT. Yes.

The CHAIRMAN. And when did we send cruisers there?

Capt. PRATT. That is the time. We put them right into the convoy that they were asked for. We simply would tell the British authorities, "We have so many cruisers. Take them when you want them and put them in." Now, let me explain one thing about the holding of a ship out from a convoy. That does not break it. That does not hurt it. Suppose, for instance, you take the St. Paul, an 18-knot ship, with Americans on board and a valuable cargo of material. They want to put her in an 11-knot or 8-knot convoy touching at Halifax. She has not got the coal to do it. It breaks the line up right away. All we would say is, "Agree to convoy, but run that ship separately. They will take a chance on that." The only thing they have to know is on a certain day to avoid certain areas; submarines in there; and they cable when they arrive. That does not break up a convoy because a certain ship does not sail in it.

The CHAIRMAN. Did those ships that did not sail in the convoy get any protection?

Capt. PRATT. They asked for it if it could be granted.

The CHAIRMAN. Were they asked to join a convoy on the outside at an assembling point?

Capt. PRATT. Not if they went separately.

The CHAIRMAN. That was separate from the convoy—a separate movement?

Capt. PRATT. Yes.

The CHAIRMAN. I think it was on June 20 that Secretary Daniels said he believed that merchant ships having armed guards were safer when sailing independently. When was that idea given up?

Capt. PRATT. I think that is just one of the points referred to. I think he possibly referred to some of our own ships. In fact, he must have referred to our own ships, because they were really the only ones that had armed guards on board.

The CHAIRMAN. It was about 2 weeks after that that we subscribed, as you have said, on July 5, to the convoy plan?

Capt. PRATT. Yes, sir. That is, the British could always put their own convoy plan in, any time that they wanted it. We contributed first not so many ships to the convoys, because we did not have them. What they wanted from us was our cruisers to help to protect their own.

The CHAIRMAN. Later, on July 5, we practically subscribed to the whole plan?

Capt. PRATT. Oh, yes.

The CHAIRMAN. Admiral Sims's first messages were fully borne out by later developments, were they not, about the convoy plan?

Capt. PRATT. You might call those the Admiralty messages, because the Admiralty, they were the ones that put that scheme through.

The CHAIRMAN. Yes, but the Admiral particularly asked that it be acceded to—the plan?

Capt. PRATT. Yes, he asked for it.

The CHAIRMAN. He made such a recommendation?

Capt. PRATT. Oh, yes; he made it. I merely state that I thought the subject of that importance was worthy of a little discussion, that is all.

The CHAIRMAN. And that would be your reason for the delay in adopting the convoy?

Capt. PRATT. I think that would be a reason, yes.

The CHAIRMAN. In the case of tugs, what effort was made by the department to accede to the requests of the Allies and the recommendations of Admiral Sims?

Capt. PRATT. No; I can not agree with him there.

The CHAIRMAN. No; I say, what was done to accede to the requests of the Allies?

Capt. PRATT. The main thing that was done was to collect together the wrecking companies, coordinate them, and detach as many of them as were not needed on this coast; organize them and get them abroad to help the British raise some of their ships. Now, with regard to the tugs, because Admiral Sims happens to ask for tugs, that is not any reason you should send them, really. I was against sending tugs over there. If we had broken up towing our coal barges the winter we had that—you remember that very severe winter. Those tugs had to take our transports as they came in, sometimes six to eight to a transport, turn them around, run the coal barges, do all that sort of thing—our supply at the rear would have broken down. The tug is really a commercial proposition, and I think those tugs were needed over here first. That, of course, is a matter of judgment.

The CHAIRMAN. So that the reason for the delay in sending tugs over was because there were no available ocean-going tugs at that time to send over when the request was made?

Capt. PRATT. That we could get, and take away from our tremendous industries which were being built up here.

The CHAIRMAN. Yes.

Capt. PRATT. I think they were needed over here more than they were over there.

The CHAIRMAN. When did the department first begin the construction of additional ocean-going tugs?

Capt. PRATT. I think I will have to refer you to Admiral McKean for that particular date. That is within his province, more—the construction. I know that we advised with the Shipping Board immediately, or early in the year, and advised them very strongly to start in building tugs.

The CHAIRMAN. Were there any delays in getting the necessary approval of the authorities for building new antisubmarine craft, and particularly destroyers?

Capt. PRATT. Of course I do not know what conferences may have taken place between the secretary and the bureau chiefs and the secretary and the Chief of Naval Operations. I do know this, that is the head of a board of which I have already submitted the plan, we worked up that scheme, and then went outside of our own province and recommended 200 destroyers and wrote out the sheet whereby the secretary was to put his approval, making it effective.

The CHAIRMAN. When did you do that?

Capt. PRATT. It was signed July 6, the same time it was handed in. He approved it right off.

The CHAIRMAN. Was it not proposed before that time?

Capt. PRATT. It may have been. As I said, I can not tell you what discussions he had with his bureau chiefs.

The CHAIRMAN. Do you not know, though, of a plan that was proposed in April for the construction of new destroyers?

Capt. PRATT. Destroyers or submarine chasers?

The CHAIRMAN. Well, both?

Capt. PRATT. Oh, I do not know that; no.

The CHAIRMAN. Which, destroyers or submarine chasers?

Capt. PRATT. Submarine chasers. I have been told by Admiral McKean—this is within his province, you know, to know all that and I am not supposed to know about these things definitely. Besides, in April I was not in the office in an executive capacity, and what I would tell you about this would be only hearsay. I could not tell you about that. You had better ask him.

The CHAIRMAN. Admiral McKean can answer those questions?

Capt. PRATT. Yes; I told you about this, about that particular recommendation of 200 destroyers. I know definitely about that. But I like to confine myself to facts, if I can.

The CHAIRMAN. I think that the testimony shows that Admiral Sims was not consulted concerning the first convoy of troops abroad until after all the plans had been made. Can you explain that?

Capt. PRATT. Yes; I think I can explain it a bit. The Army wanted to send over these troops, and they wanted to do it very quietly—very secretly. It was necessary to get our men over into France, if for nothing more, to cheer them up by the presence of our soldiers. Admiral Sims at that time had submitted no definite plan for getting our troops across, so Admiral Cleaves, who was in charge of troop transportation on this side, came to Washington and made his plan out. He sailed with his ships about June 14. The plan was made entirely by Admiral Gleaves. And further, let me say, about all the details of arranging for troop transportation that all had to be done on this side. The only plan that Admiral Sims had anything to do with was what is called the routing plan, and his routing plan, which, of course, involved the point or longitude where the authority shifts from this side to the other, and the point or the place where his escort should take on, that is his province. That is the only part of the transport plan that he ever had anything to do with at all.

Now, where the trouble comes in is here. In arranging details of the plan, Admiral Gleaves, instead of putting them all over and crossing a certain meridian at a certain date, thought that it would be wise to split them up into four parts. That made added escort necessary, and took more destroyers to protect those troops than was really economical. That was the first move. Admiral Sims protested against that, and suggested different routing and method of routing, which came after Admiral Gleaves had sailed. There was no question about that, it was accepted immediately; but the Army wanted us to get those ships off as soon as they could go, and they just went.

The CHAIRMAN. Should not Admiral Sims have been notified of it——

Capt. PRATT. He was notified when they sailed.

The CHAIRMAN (continuing). Before the plan was made, so that he could take part in the plan?

Capt. PRATT. Oh, no, sir; he would not really have any more part in going into the details of that sort of thing than we would in interfering in a lot of work over on his side.

The CHAIRMAN. Did he not have anything to do on the other side when the troops arrived in the war zone?

Capt. PRATT. He escorted us. His was the duty of escort.

The CHAIRMAN. And that, of course, was an important duty?

Capt. PRATT. Oh, very important.

The CHAIRMAN. Should not that matter have been a part of the general plan, and in making the general plan should not Admiral Sims, who was familiar with all matters on the other side, have been consulted?

Capt. PRATT. Why did he not get his plan over to us a little earlier, that is all? He has got some part in this to play. It is not all one-sided.

The CHAIRMAN. Was he asked to get his plan over earlier?

Capt. PRATT. He knew, as any sane man, that we would——

The CHAIRMAN. Was he told when the troops were to be sent over so that he could get his plan here?

Capt. PRATT. He has got to be a little forehanded, like everybody else.

The CHAIRMAN. But he was not asked to do so, was he?

Capt. PRATT. I would not ask him any more than I would ask any other officer to think about these things. He had his plan. He did not get it over quick enough with his routing instructions. They came after we left.

The CHAIRMAN. But he was not asked to do so as commander of those forces?

Capt. PRATT. No, sir; but as commander of the forces in European waters I think he was wise enough and big enough to send it over himself. I am not criticising him at all, but just trying to look at it fairly.

The CHAIRMAN. Upon what information were these plans based?

Capt. PRATT. Just what do you mean, sir? I do not quite——

The CHAIRMAN. Information about the general situation on the other side?

Capt. PRATT. Why, yes.

The CHAIRMAN. I do not mean about troops, but about the general naval situation.

Capt. PRATT. That was when Joffre came over here and that was taken up. He impressed upon us the need of getting troops there just as soon as we could.

The CHAIRMAN. That is not what I mean. I am referring to the general naval situation on the other side, as to matters of escorts, and things of that sort.

Capt. PRATT. I am still a little at sea. Will you straighten me out on that again?

The CHAIRMAN. I ask from whom you got information about conditions in the war zone in regard to what escort would be needed and at what particular places the escort should meet the troops, and matters of that sort?

Capt. PRATT. Oh. When we wanted to route a ship we would cable to Admiral Sims and say, "Such and such due to sail a certain date. Please appoint rendezvous and furnish adequate escort." He did the rest. He cabled back to say where those ships should be, the point they should proceed to, and then he would cable back the number of escort he would furnish, and then we informed the ships sailing.

The CHAIRMAN. To what extent was he responsible for the safety of the transports in the war zone?

Capt. PRATT. He was responsible for them. I think his jurisdiction, we may say, was from longitude 30, where our agreement was made with the Admiralty. I put longitude 30. He did not meet them at longitude 30 necessarily. He met them wherever he thought was the right place.

The CHAIRMAN. He was responsible for them after they had crossed that longitude?

Capt. PRATT. Yes. We left that entirely to his own judgment, as to where he would meet them. He knew more about that than we did. We never interfered with him in matters of that sort. It was up to him.

The CHAIRMAN. So that he was responsible for them during a number of days during the latter part of the trip over?

Capt. PRATT. Yes, sir.

The CHAIRMAN. And yet he was not consulted about plans of sending them over?

Capt. PRATT. No. Just what do you mean by that? I do not quite get you, sir.

The CHAIRMAN. He was not consulted?

Capt. PRATT. He was told about routing.

The CHAIRMAN. About the number of vessels that would go at a certain time?

Capt. PRATT. He furnished the routing instructions for those ships.

The CHAIRMAN. I say he was not consulted about the plans, just how many were to go at a certain time?

Capt. PRATT. No; but it was not——

The CHAIRMAN. The number of ships that were to go?

Capt. PRATT. No; and it was not necessary. That was not a part of his job.

The CHAIRMAN. When was he notified of the sailing of the first ship convoy?

Capt. PRATT. I do not recall; but if it followed our usual custom, he would be informed at about the date of sailing, which would be about six or seven days, probably, before they had arrived at rendezvous. You see, they had quite a time, five or six days, say, before they would arrive at the rendezvous.

The CHAIRMAN. How long did it take him to have his escort ready at longitude 30, if he decided to send the escort out?

Capt. PRATT. I do not know the details of that. Admiral Bayly arranged all that. Admiral Sims did not.

The CHAIRMAN. About how long would it take for the ships to sail from Queenstown out there to meet the troop convoy?

Capt. PRATT. It takes about half an hour for them to get up steam on the oil burners, and they are always lying there ready; and there were always a certain number on duty.

The CHAIRMAN. And then they could get out to longitude 30 in what time?

Capt. PRATT. They never went out as far as longitude 30; 19 to 20 was about the place. Admiral Sims or Admiral Bayly varied it himself whenever he wanted to. We never bothered them in that respect, at all.

The CHAIRMAN. What I wanted to find out is—it may or may not be material——

Capt. PRATT. ✓

The CHAIRMAN (continuing). How long did it take the Admiral to get his ships out to meet the convoys? You say it would take the ships about six or seven days to get to the place where he would meet them.

Capt. PRATT. You are asking me questions I have got to do a little figuring on. Let me get my map out. [After making calculation.] About two days to get out there.

The CHAIRMAN. About two days, which would give him four or five days after his plan for the escort in the war zone was accepted?

Capt. PRATT. His routing instructions did that, absolutely.

The CHAIRMAN. From the start?

Capt. PRATT. After that first convoy.

The CHAIRMAN. After the first convoy?

Capt. PRATT. There was only one time after that when there was any question of going against a recommendation which he made in that respect, and after some discussion he accepted it, and that was when the German submarines were working pretty extensively on the northern lanes that he had laid out, he prescribed the crossing between certain latitudes. We suggested moving down 5 degrees further south, and adding that into the routing instructions, as being a little safer. There was some discussion over that in three or four cables, but he agreed to that, and we included that area, and I believe it helped some.

The CHAIRMAN. Was the department's action in the case of the first convoy based on the belief that full information regarding all details of sending it was available in Washington?

Capt. PRATT. No, the War Department did not know anything about it. Their sending of troops was based entirely on the information, I imagine, that Joffre gave them here.

The CHAIRMAN. No, I did not say the War Department. I said the Navy Department's action.

Capt. PRATT. Oh, I thought you said the War Department. Will you let me have that again?

The CHAIRMAN. Was the department's action in the case of the first convoy based on the belief that full information regarding all details of sending it was available in Washington?

Capt. PRATT. I do not believe I know what that means.

The CHAIRMAN. You have stated that you did not have Admiral Sims' plan for the convoying escort for the first convoy?

Capt. PRATT. No.

The CHAIRMAN. You had them after that?

Capt. PRATT. Yes.

The CHAIRMAN. And did the department feel that it had information enough on which to send it over without such a plan, when the first convoy was sent over?

Capt. PRATT. Yes, it did. It got it over.

The CHAIRMAN. And afterwards it changed its plan?

Capt. PRATT. It changed it because it was an uneconomical distribution of force, which we recognized immediately after Admiral Sims protested. But as far as available knowledge went, why, yes.

Just let me explain a little further, so that you will see how fully conversant we were with the situation. There was not a submarine on the other side that moved that Sims did not give us information of constantly, as nearly as the British could give it to him. We plotted on an enormous sheet which we kept day by day the actual position

of every submarine that was known to be operating around the British Isles, on the Bay of Biscay coast, and off the Straits of Gibraltar. Those markers were moved daily, and sinkings were put down opposite them, and at the end of every 15 days we took a tracing of that sheet and put it away for future reference; so that we had exactly the same information as to the submarines and times of sailing as they had, because the British themselves kept us very well informed.

The CHAIRMAN. It seems to me, if after the first convoy was sent over Admiral Sims sent you new plans for a convoy and escort and those plans were immediately adopted by the department, it would have been just as well to have consulted Admiral Sims before the first one was sent, and to have gotten his plan of escort.

Capt. PRATT. I am perfectly willing to grant the point.

The CHAIRMAN. Was there ever any difficulty in getting the Navy Department to take action in taking over the troop transports?

Capt. PRATT. Any difficulty in getting the Navy Department?

The CHAIRMAN. Yes.

Capt. PRATT. My recollection of the way that was handled is this: We very early saw the necessity of taking the transports under complete naval control. The first group of ships that went over were manned under the auspices of the Shipping Board in which the crews were not under strict military jurisdiction, that is rather a dangerous procedure when you get into the submarine waters, because if a fireman wants to work under the eight-hour law, and stops firing, steam is likely to go down. The General Staff of the Army recognized that it would be a good thing—I am not speaking of naval officers alone—and were very anxious to have them under naval jurisdiction. But then there was a third party, the Shipping Board, who were interested in these ships. That had to be adjusted. So that after we picked out the number that we wanted, it became a question of getting the signatures of the Secretary of the Navy and of the Secretary of War and of Mr. Denman of the Shipping Board. When the original plan was drawn up, I think through an oversight, the place for Mr. Denman's name was omitted, it was forgotten that he had really an interest in these ships, and a very active one. I think Secretary Baker was the first one to sign it. I think Secretary Daniels signed it next, and then the question came up of Mr. Denman's signature before it could go into effect. Like all plans of considerable magnitude of that sort, it takes time to get them going. Whether the Secretary signed immediately or whether he delayed a day or two, if that is what you mean, or something of that sort. I can not say, but it does not appear to me—I think Mr. Denman delayed a day or two in signing.

The CHAIRMAN. Capt. Laning testifies that there was a considerable delay in getting the department to put through this question of having the Navy Department have charge of the transports for troops. Do you recall any delay?

Capt. PRATT. I do not just exactly know what he means. You see, it is a joint operation, to begin with, and it involves shifting over from the Army to the Navy. Really, the Army quartermasters run the transport system. We have always wanted to get it under naval control, and they have always been a little loath to give it up. Then in comes a third party, the Shipping Board, with a very good claim, as they think, upon these ships; so that we are laboring under

three forces, and the Navy always wanted—at least, the naval officers always wanted—to get absolute control of the transports so that we would know from the start to the finish of the voyage that they would be given the best protection that was possible. All these were matters of discussion and adjustment, and it is very possible that is what he means.

The CHAIRMAN. I read from the testimony of Capt. Laning at page 980-q, of the typewritten record [reading]:

There is perhaps no achievement of the Navy that has been as favorably commented on as its work in transporting troops across the ocean during the war. I will now point out how hard it was to get the Navy Department to take any action that would enable the Navy to get control of and operate the transports.

In connection with my duties in regard to Navy material, early in May, 1917, after carefully studying the situation, I prepared a memorandum on the subject of the Navy manning and handling the transports that would be utilized in carrying troops abroad. Unfortunately I did not save a copy of that memorandum. However, about May 24, 1917, no action having been taken on the matter and a letter having been received concerning the use of the *Vaterland* for transport duty, I took the occasion to prepare a department letter to the Secretary of the Treasury, who at that time had possession of the seized German ships, setting forth the necessity of having troop transports manned and operated by the Navy and requesting that 16 of the largest, fastest, and most suitable of the seized German ships be turned over to the Navy to be fitted out for that purpose. The letter followed closely the lines of the memorandum I had previously prepared. It reads as follows:

NAVY DEPARTMENT,
Washington (penciled), May 25.

SIR: I have to acknowledge the receipt of your letter of May 22, forwarding a copy of the letter from the collector of customs of New York, in which he recommends that the *Vaterland*, not being suitable for a cargo ship and being especially suitable for a transport, should not be intrusted to a merchant crew but should be under the command of an officer of the department that would operate her in the transportation of troops.

I most heartily concur in the collector's view and recommend that not only the *Vaterland* but also such other of the seized German ships that are required for use as troop transports be turned over to the Navy Department to be prepared, fitted out, manned, and operated by the Navy in that service.

In this connection I invite your attention to the necessity of the Navy operating all vessels used in the transport of troops during war and especially of these vessels operating in waters where the enemy may be encountered. Unless such ships are manned and operated by the Navy the chances of their loss will be tremendously increased; and, since their destruction will cause enormous loss of life and may jeopardize the campaign, we must take every possible step beforehand to reduce the chance of such a loss to a minimum.

The first consideration in the transporting of troops is their safety. It must be remembered that while on troop ships the troops can not fight. A torpedo or even one lucky shot from a gun may sink a transport with practically all its precious freight of munitions and lives. It follows then that every plan for transporting troops must contain every possible safety precaution. The mere presence of a naval convoy is not in itself sufficient protection, and especially so against submarine attack.

The ships carrying troops must maneuver and operate defensively under command of the convoy commander. It is evident that the haphazard gathering of ships to transport troops, with personnel untrained to maneuvers or even to communication with the leader of the force, is merely inviting colossal disaster. The country stands to lose all and gain nothing by such a method of handling troops. It may be justly likened to detailing an untrained industrial force to go into the fighting line on land. Such a plan would have no chance against a powerful and resourceful enemy. Even to a less extent would an industrial Navy have any chance against the enemy's fighting Navy, and to carry thousands of troops into the waters of the fighting front in industrial shipping places them in the greatest possible danger.

While there are a multitude of details in connection with the transportation of troops there are two points of vital importance to be considered in assigning transports. These are:

- (1) The selection of vessels of suitable type, with sufficient capacity and speed.
- (2) The personnel and operations of the vessels.

The selection of ships for transport service requires care. Ships suitable have accommodations for a great number of men and cargo capacity for the equipment and supplies of the men carried. Speed enters into the selection for several reasons. First comes the question of safety, for the greater the speed the more immune is a ship from attack.

Next comes the question of grouping the transports according to speed. If we have ships of various speeds in one group of transports, the speed for all of the group becomes that of the slowest ship. If we put the *Vaterland*, with 24 knots speed, in a group containing one ship of, say, 15 knots speed, the *Vaterland* becomes for that group a 15-knot ship and at once loses the value of her great speed. It follows then that in selecting and arranging ships for transport service we must select ships of uniform speeds for each group and sufficient groups to carry out our task.

From a study of the possible requirements of our overseas operation it would seem that four groups of ships should be provided. If of sufficient speed each group could make a round trip about once each month and this would give us a constant steady flow of troops and supplies to the front. After a careful study of the most suitable for the purpose, the Navy Department is convinced that the best available are certain of the seized German ships. They were especially designed to carry troops and can be put in service in the shortest possible time. It is possible to use them, since by so doing the regularly established shipping routes are least interfered with. These ships are at once the best and most available for the purpose, and of them those listed below will answer the immediate requirements. They are grouped as to speed and each group would form one unit of the transport service, probably as large a unit as could be safely convoyed with the present situation as it is. These groups are as follows, the estimated troop capacity based on an allowance of 4 tons per man carried:

| | Estimated troop capacity. |
|-----------------------------------|---------------------------------|
| First group: | |
| Vaterland..... | 10,000 |
| Kronprinzessin Cecellie..... | 3,000 |
| Kaiser Wilhelm II..... | 3,000 |
| Von Steuben..... | 2,500 |
| Second group: | |
| George Washington..... | 8,000 |
| America..... | 7,000 |
| Martha Washington (Austrian)..... | 3,000 |
| Third group: | |
| Hamburg..... | 3,300 |
| Grosser Kurfurst..... | 4,000 |
| Konig Wilhelm II..... | 3,000 |
| Princess Alice..... | 3,300 |
| Princess Irene..... | 3,300 |
| Fourth group: | |
| Cincinnati..... | 5,000 |
| President Grant..... | 6,000 |
| President Lincoln..... | 6,000 |
| Frederick der Grosse..... | 3,300 |

With a fleet of transports operating in groups as above we could handle about 100,000 men a month, with all their equipment except animals.

To handle these ships safely, they must have the personnel trained to operate by naval methods. This applies not only to the actual maneuvering of the ship but also to the specially trained men to man and operate the guns, the signaling outfit, and the radio outfit. Men untrained in naval methods can not operate any of these and yet on them depends the ship's safety.

Also we must not overlook the fact that each of these ships must be supplied and equipped with naval outfits of signal books, radio, etc. These things can not be entrusted to any but naval men. They are most secret, and to allow them to fall into other hands endangers not alone the ships of the expedition but the whole operation that uses them.

Again we must bear in mind that these ships, carrying the most precious and vital part of our war forces, must be entirely manned by men tried and true in the methods of signing up crews for merchant shipping, if used in obtaining crews for our transport service, leaves an open way for enemy agents or sympathisers to get into the crews of these vessels, and they can carry out any nefarious design they wish. We must man transports from captain to coal passer with the most dependable men available, so that there may be the minimum danger from enemy agents

above it is evident that there can be no division of authority on the ships carrying troops. If the Navy is to be responsible for the safety of the expedition, it can not permit any but its own representatives, trained to the duties of the duty, to operate any part of it. Even then, only by close coordination every unit of the expedition, can success be expected, and with the coordination the duty is fraught with danger. We can not permit added danger by putting any phase of the troop transportation in the hands of untrained and unaided assistants, or in the hands of anyone of whose loyalty and fidelity there is any doubt.

We strongly urge that this matter be given careful attention, and that not only the *U.S.S. Albatross* but all the other vessels listed above as necessary for transport that are not now assigned to the Navy, be assigned to the Navy at once in order that they may be properly fitted and equipped for the work and manned and equipped as troop transports at the earliest possible time. As not only the safety of the expedition but also the success of our whole campaign in the war depends on this, it should be decided on now and not wait for terrible disaster to show us the necessity of adopting any other plan.

Sincerely yours,

THE SECRETARY OF THE NAVY.

Respectfully,
Honorable the SECRETARY OF THE TREASURY.

PRATT. What date is that: early in May?

CHAIRMAN. May 25.

PRATT. Well, I do not know about that. I know that when the case came up.

CHAIRMAN. After reading that letter, Capt. Laning continued his [reading]:

As later I prepared a letter to the Secretary of War asking the War Department assistance toward getting the troop transport service turned over to the Navy to be established on a sound basis. This letter, which was returned to me later from Admiral Benson's office unsigned and marked "hold," reads

NAVY DEPARTMENT, Washington.

and note: "Hold, (Capt. McKean.)"

There is forwarded herewith a copy of a letter I am this day sending the Secretary of the Treasury, suggesting that certain seized German ships be turned over to the Navy to be fitted out, manned, and operated by the Navy as troop transports. The Navy Department does not desire to change the arrangements already made by the War Department concerning the immediate transportation of troops across the Atlantic, it feels that the ultimate problem is so essentially naval that it is incumbent on the Navy in its duty if it did not point out what it believes to be the most efficient and safe method of carrying out its part of the general mission.

The Navy is concerned in transportation of troops only from the time they go on board troop ships until they leave the ships, but during that time it is entirely responsible for the expedition. The points of embarkation and debarkation marking the beginning and end of the Navy's responsibility, and in view of that responsibility demands a well-planned and carefully organized service.

The Navy Department is of the opinion that the transportation of troops should be accomplished as little as possible with shipping now engaged in transporting supplies across the Atlantic, and to that end proposes that certain seized German ships, especially those designed for use as transports in war, be fitted up for the purpose. The ships should be repaired immediately, but when repaired, equipped, and properly manned should be the best ships possible for the work. The ships named in the letter will give good service and will probably handle the transport question fully, enabling the Navy to deliver in the neighborhood of 70,000 troops per month on the western coast. It is not proposed that all supplies for troops be sent on these transports, but that they will, of course, carry all that their capacity permits. Munitions, animals, and other heavy freight, as a general rule, be transported by merchant ships, while fresh troops with their baggage will go forward on transports.

The arrangements for the Navy handling this service are set forth in general terms in my letter to the Secretary of the Treasury, and in view of the necessity of at once establishing the service on the best possible basis, I request that the War Department, if it concurs with the views set forth, assist in every possible way to establish the service as soon as possible, and ended at the earliest possible time.

Sincerely yours,

THE SECRETARY OF THE NAVY.

Respectfully,
Honorable the SECRETARY OF WAR.

Then he says:

As I said before, that letter was not signed, and was returned to me marked "Holt". Even as late as July 3, 1917, I was still hammering away the little I could to get the transports turned over to the Navy. This is evidenced by a memorandum submitted by me to the Chief of Naval Operations on July 3, 1917, and which I will place in the record.

I will ask the stenographer to put this also in the record at this time.

The memorandum referred to is here printed in the record as follows:

NAVY DEPARTMENT,
Washington, July 3, 1917.

MEMORANDUM.

Attached hereto is a copy of a letter addressed to the President by the Chairman of the Shipping Board, in which it is requested that all seized ships not already turned over to the Navy be transferred to the Shipping Board.

It is noted from the letter that while the Shipping Board is apparently averse to turning over to the Navy or Army any of the seized ships that are to be used as transports, they suggest that the President give the matter consideration and that a decision as to what branch of the Government shall operate troop ships should be reached only after the arguments of all concerned are heard.

It is further noted from the letter that the board states that there is abundant time to make this decision before the ships are ready to load. This statement would be true if a merchant ships were ready for use as a transport whenever she is ready to load, but such is not the case. A very considerable change must be made in merchant ships before they are suitable for transport use and to delay making these changes will merely delay the readiness of the ships for the service. The decision should be made at the earliest possible time and the fitting-out work started.

From conversation with Shipping Board representatives it is understood that they agree that some of the German ships must be used as transports, but they are of the opinion that such ships should be officered, manned, and operated by the Shipping Board and taken by the Army on "time charter" whenever it becomes necessary to transport troops. They apparently fail to grasp the idea that if we are to transport a large number of troops to France it will require a special service of large, fast ships, and that the ships engaged in that service will be worked to capacity and can not do any cargo carrying other than to bring such cargo from their ports of call in Europe as may be ready when the ship is about to return. Inasmuch as the transports can not engage in commercial work at all, it hardly seems proper that the board should insist that they be officered, manned, and operated by civilian complements.

To operate troopships in the submarine danger zone with any but the best disciplined and most loyal crew available is merely inviting colossal disaster. The Shipping Board plans to officer and man its ships as all merchant ships are officered and manned. One has but to read the reports of the officers in charge of our armed guards to realize the absolute menace to any ship by employing that method: yet it is the Shipping Board's plan to apply it to ships carrying invaluable munitions and thousands of men on whom our success in war depends.

Unless troopships are manned and operated under the trained and loyal men of the Navy the chances of their loss will be tremendously increased, and since their destruction will cause enormous loss of life and may jeopardize the campaign, we must take every possible step beforehand to reduce the chance of such loss to a minimum.

The first consideration in the transporting of troops is their safety. It must be remembered that while on troopship the troops can not fight. A torpedo or even one lucky shot from a gun may sink a transport with practically all its precious freight of munition and lives. It follows that every plan for transporting troops must contain every possible safety precaution. The mere presence of a naval convoy is not in itself sufficient protection to troopships, especially against submarine attack. When attacked, the ships carrying troops must maneuver and operate defensively under the command of the convoy commander. It is evident that the haphazard gathering of ships to transport troops, with personnel untrained to maneuvers or even to communication with the leader of the force, is merely inviting colossal disaster. The country stands to lose all and gain nothing by such a method of handling troops. It may be just likened to detailing an untrained industrial force to go into the fighting line on land. Such a plan would have no chance against a powerful and resourceful enemy. Even to a less extent would an industrial navy have any chance against the enemy's fighting navy, and to carry thousands of troops into the waters of the fighting front in industrial shipping places them in the greatest possible danger.

While there are a multitude of details in connection with the transportation of troops, there are two points of vital importance to be considered in assigning transports. These are:

1. The selection of vessels of suitable type, with sufficient capacity and speed.
2. The personnel and operation of the vessels.

The selection of ships for transport service requires care. Ships suitable must have accommodations for a great number of men and cargo capacity for the equipment and supplies of the men carried. Speed enters into the selection for several reasons: First comes the question of safety, for the greater the speed the more immune is a ship from submarine attack. Next comes the question of grouping the transports according to speed. If we mix ships of various speeds in one group of transport, the speed for all the group at once becomes that of the slowest ship. If we put the *Vaterland*, with 24 knots speed, in a group containing one ship of say 15 knots speed, the *Vaterland* becomes for that trip a 15-knot ship and at once loses the value of her great speed. It follows then that in selecting and arranging ships for transport service we must select ships of similar speed for each group and sufficient groups to carry out our task.

From a study of the possible requirements of our overseas operation it would seem that four groups of ships should be provided. If of sufficient speed, each group can make a round trip about once each month, and this would give us a constant and steady flow of troops and supplies to the front. After a careful study of the ships most suitable for the purpose, the Chief of Operations is convinced that the best ships available are certain of the seized German ships. They were especially designed to carry troops and can be put in service in the shortest possible time. It is advisable to use them, since by so doing the regularly established shipping routes will be least interfered with. These ships are at once the best and most available for the purpose, and of them those listed below will answer the immediate requirements. They are grouped as to speed and each group would form one unit of the transport service, probably as large a unit as could be safely convoyed with the submarine situation as it is. These groups are as follows, the estimated troop capacity being based on an allowance of 4 tons per man carried:

| | Estimated troop capacity. | Speed, knots. |
|-------------------------------------|---------------------------------|------------------|
| First group: | | |
| <i>Vaterland</i> | 10,000 | 24 |
| <i>Kronprinzessin Cecelle</i> | 3,000 | 23½ |
| <i>Kaiser Wilhelm II</i> | 3,000 | 23½ |
| Second group: | | |
| <i>George Washington</i> | 8,000 | 19 |
| <i>America</i> | 7,000 | 17.5 |
| Third group: | | |
| <i>Hamburg</i> | 3,300 | 16 |
| <i>Grosser Kurfurst</i> | 4,000 | 15.5 |
| <i>Konig Wilhelm II</i> | 3,000 | 15.5 |
| <i>Princess Alice</i> | 3,300 | 15.5 |
| <i>Princess Irene</i> | 3,300 | 15.5 |
| Fourth group: | | |
| <i>Cincinnati</i> | 5,000 | 15 |
| <i>President Grant</i> | 6,000 | 14.5 |
| <i>President Lincoln</i> | 6,000 | 14.5 |
| <i>Frederick Der Grosse</i> | 3,300 | 14.5 |
| <i>Barbarossa</i> | 3,000 | 14 |

With a fleet of transports operating in groups as above we could handle about 70,000 men a month, with all their equipment except animals.

To handle these ships safely, they must have a personnel trained to operate in naval methods. This applies not only to the actual maneuvering of the ship, but also the specially trained men to man and operate the guns, the signaling outfit, and the radio outfit. Men untrained in naval methods can not operate any of these things and yet on them depends the ships' safety.

Also we must not overlook the fact that each of these ships must be specially equipped with naval outfits of signal books, radio, etc. These things can not be intrusted to any but naval men. They are most secret and to allow them to pass into other hands endangers not alone the ships of the expedition, but the whole Navy that uses them.

Again we must bear in mind that these ships carrying the most precious and essential part of our war forces must be entirely manned by men tried and true. The methods of signing up crews for merchant shipping if used in obtaining

vessels in our transport service leaves an open way for enemy agents or sympathizers to work into the crews of these vessels and they can carry out any nefarious designs they might wish. We must man transports from captain to coal passer with the most dependable men available, so that there may be the minimum danger from enemy agents.

From the above it is evident that there can be no division of authority on the ships engaged in carrying troops. If the Navy is to be responsible for the safety of the convoy after sailing it can not permit any but its own representatives, trained to the requirements of the duty, to operate any part of it. Even then, only by close coordination between every unit of the expedition can success be expected and with the utmost coordination the duty is fraught with danger. We can not permit added dangers by putting any phase of the troop transportation in the hands of untrained and unorganized assistants, or in the hands of anyone of whose loyalty and fidelity there can be any doubt.

This matter should be given careful attention and all the vessels listed above as necessary for transport duty, be assigned to the Navy at once in order that they may be properly fitted and equipped for the work and manned and put in service as troop transports at the earliest possible time. As not only the safety of the expeditions but also the success of our whole campaign in the war depends on this matter, the correct decision should be reached without waiting for terrible disaster to show us the error of adopting any other plan. The best service possible is none too good for taking our troops across the sea and that best service is the service of the Navy.

It is not contemplated to use these vessels as naval auxiliaries, but only to take them under complete naval control during such time as they are employed in carrying troops for the Army. The Navy Department does not wish these ships to remain permanently in the Navy, but to have them revert to the Shipping Board when the transportation of troops has been completed.

Capt. PRATT. It looks as though Capt. Laning had a little hard luck.

The CHAIRMAN. Apparently the letter he had prepared for the Secretary to send was held. It was marked "hold." Do you know anything about those circumstances?

Capt. PRATT. I do not know anything about that letter, but I do know—I can not say the time—but some time before June 25 Capt. Chase turned over to me and said, "Get those transports;" or something like that. I went to work at it, and I got them. The President signed the proclamation July 6, I think. That necessitated getting the Secretary's signature and Mr. Denman's signature and the signature of the Secretary of War. I do not know anything about Capt. Laning's letter.

The CHAIRMAN. It shows that the transports turned over about July 10 were the very ones suggested in the first memorandum.

Capt. PRATT. Admiral McKean, I think, knows more about that than I do. I was only planning, along about that time; but I know that when they turned that job over to me, we got them after a while, and the President signed it about July 6. Admiral McKean can supply the details.

The CHAIRMAN. I am afraid we shall have to adjourn now, Captain. There is a matter upon the floor of the Senate in which we are all interested and we must be there. We will adjourn until Monday morning at 10 o'clock.

(Thereupon, at 12 o'clock m., the subcommittee adjourned until Monday, April 26, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

MONDAY, APRIL 26, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present, Senators Hale (chairman), Ball, Pittman, and Trammell.

TESTIMONY OF CAPT. W. V. PRATT—Resumed.

The CHAIRMAN. The committee will come to order. Capt. Pratt, I have a number of questions to ask you this morning, and I hope that as far as possible you will make your answers as short as you can. I do not want to suppress any information, at all, but I think we would like to get along as fast as we can with the hearing.

Capt. PRATT. Yes, sir.

The CHAIRMAN. Capt. Pratt, I have been impressed with the great amount of work that you and your brother officers of the Bureau of Operations have had to do during the war. Now, I want you to tell me what the Navy Department would have done if there had been no Bureau of Operations.

Capt. PRATT. I think, sir, it would have fallen to pieces, not because the bureaus were not thoroughly efficient and headed by men who thoroughly understood their own duties, but because it was necessary to have a coordinating head, some one who looked at the plan and policy alone, in order that each bureau should play its appointed part.

The CHAIRMAN. Who is responsible for the creation of the Office of Operations?

Capt. PRATT. I do not know that, sir. Admiral Benson knows more than I do.

The CHAIRMAN. Was not that included in the Fiske plan?

Capt. PRATT. Yes, I think he broached the idea first.

The CHAIRMAN. You think that Fiske did?

Capt. PRATT. I think so, sir.

The CHAIRMAN. Did not the Secretary use his influence to strike out of the original bill the word "responsible," the one word which would have given the Chief of Operations authority over the bureaus and authority to coordinate them under that section?

Capt. PRATT. I think you had better ask Admiral Benson that question, because I do not know.

The CHAIRMAN. You believe that the word "responsibility" should be there?

vessels in our transport service leave to work into the crews of these vessels they might wish. We must man transportable men available, so that agents.

From the above it is evident that engaged in carrying troops. If the convoy after sailing it can not permit requirements of the duty, to operate in coordination between every unit of the utmost coordination the duty is fraught with dangers by putting any phase of the and unorganized assistants, or in the there can be any doubt.

This matter should be given careful consideration necessary for transport duty, be assigned to be properly fitted and equipped for the transports at the earliest possible time but also the success of our whole campaign. A correct decision should be reached without error of adopting any other plan. The transportation of our troops across the sea and that best.

It is not contemplated to use these vessels under complete naval control during the carrying of troops for the Army. The Navy vessels remain permanently in the Navy, but when the transportation of troops has been completed.

Capt. PRATT. It looks as though it is a matter of luck.

The CHAIRMAN. Apparently the matter was held. It was nothing about those circumstances.

Capt. PRATT. I do not know. I do not know—I can not say the time. Capt. Chase turned over to me the proclamation or something like that. I went to the President signed the proclamation. I got the Secretary's signature and the signature of the Secretary of War about Capt. Laning's letter.

The CHAIRMAN. It shows that the July 10 were the very ones suggested.

Capt. PRATT. Admiral McKean, I was only planning, and that when they turned that job over to me, and the President signed it. I can supply the details.

The CHAIRMAN. I am afraid we shall have to be there. There is a matter upon the floor of interest and we must be there. morning at 10 o'clock.

Capt. PRATT. Yes, sir.

The CHAIRMAN. You believe that the Chief of Operations should have the responsibility of preparing the Navy for war, and authority under the supreme authority of the Secretary?

Capt. PRATT. Yes, sir; I think that he should have the same authority, practically, that the Chief of Staff of the Army has: that is, military authority only, under the supervision of the Secretary of the Navy, under the President.

The CHAIRMAN. With the responsibility?

Capt. PRATT. With the responsibility; yes, sir.

The CHAIRMAN. And with that responsibility the chief of operations should have the power to bring his views before Congress?

Capt. PRATT. I think he should, sir; and if he then does what he ought not to do, the Secretary can replace him by another man and should replace him. If, on the other hand, he finds that he is not being supported by the Secretary, he can bring his opinion directly before the proper authorities.

I further believe, however, that the general board should be created by law and not be a board appointed by the will of any person, because the general board acts in the capacity of the "elder statesman," you might say, within the Navy Department; and they, if created by law, would have a great check upon the Chief of Naval Operations in case he overstepped his authority, and they would also be in a position to write up documents which would clear the whole situation. It would be a check both ways.

The CHAIRMAN. I am going to ask you, Capt. Pratt, later on to submit any suggestions that you might have that have been derived from your experience during the war in the Bureau of Operations, for any changes that might be profitable in the organization of the department.

Capt. PRATT. Yes, sir; I can answer that question right now. I have already drawn up such a paper, and have also submitted it to the Chief of Naval Operations, with the request that he call a conference—ask the Secretary to have a conference between himself and all bureau chiefs and everyone else concerned in order that there would be no dissenting opinion when it came up. I have done that.

The CHAIRMAN. With a view of giving that to the committee?

Capt. PRATT. I did not mention the committee, sir. It passes out of my hands.

The CHAIRMAN. That is for the department?

Capt. PRATT. That is for the department.

The CHAIRMAN. Can you give the committee a copy of that plan?

Capt. PRATT. I can, sir, at any time you wish it.

The CHAIRMAN. I will write you about that.

Capt. PRATT. Yes, sir.

The CHAIRMAN. What would have happened during the war if there had been no division of material and no planning section in the Division of Naval Operations with plans for carrying on the war?

Capt. PRATT. Without a division of material we would have fared badly. Without the planning section, once we got into the war, we would have had to depend largely on Sims's planning section, and as a matter of fact that is what we did do except for matters that occurred in the United States. We used the papers that Sims's planning section sent over to us, and they did a wonderful work.

Capt. PRATT. In a very general way, sir.

The CHAIRMAN. Would you consider that those systems constituted a good beginning upon which to base an organization to prepare and conduct a war?

Capt. PRATT. I think that is correct as far as it goes. The difference between that organization and the organization I would have in my mind, is this: Those aids are coordinated directly to the Secretary of the Navy. I would say those aids should be coordinated directly under the military head or Chief of Naval Operations under the Secretary. That would be the difference.

The CHAIRMAN. Will you repeat the first part of that? I could hear it.

Capt. PRATT. As I understand the Moody plan, the various aids are coordinated directly under the Secretary. In other words, there might be exactly as much strife as regards the plan and policy under the present system as there is under the present. Under the present system the bureau chiefs coordinate directly under the Secretary of the Navy. I would have the aids for material, personnel, and inspection coordinated directly under one military head, under the Secretary; in other words, I would provide that they should be coordinated under the Chief of Naval Operations instead of directly under a civilian head, but the civilian head always exercising that right of authority to discharge his policy man whenever his policies conflicted with the Secretary's.

Senator PITTMAN. Mr. Chairman, may I interrupt just a minute to ask any questions, but, approximately, how long do you think it will be before you are through with Capt. Pratt?

The CHAIRMAN. I hope to get through this morning.

Senator PITTMAN. There is a meeting of the Naval Affairs Committee, as of course you know, at 10.30 this morning, and the chairman of the committee has asked that we be over there. He is trying to get a quorum and wants to act upon some amendments that have been agreed upon between the House committee and the Senate committee. If you will excuse me, I will go over to that meeting.

The CHAIRMAN. Very well.

At this point Senator Pittman left the hearing.)

The CHAIRMAN. Capt. Pratt, do you think it was wise to destroy and discredit the Mahan system and return to the bureau system with only an aid for operations who had no authority to coordinate the bureaus?

Capt. PRATT. No, sir; it is a return to an older order of things which was not as wise.

The CHAIRMAN. You think it was not wise to do this?

Capt. PRATT. I do think it was not wise.

The CHAIRMAN. You have excused our lack of preparation for World War by saying that such preparation would have been an overt act. Is there any principle in international law which forbids a neutral nation to prepare in anticipation of being forced into war?

Capt. PRATT. Oh, no. The overt acts that I spoke of were those that would have to be accomplished in order to make our Navy roughly efficient. I do not mean by that that the Navy itself should not be prepared to the minute, because I believe it should

It is always good insurance.

people who have to suddenly jump from peace-time activities to war-time activities.

The CHAIRMAN. And it would have changed your plans, of course, to a considerable extent?

Capt. PRATT. Not the general basic plan. The details of the plans would have been changed.

The CHAIRMAN. You did not draw up the basic plans, did you? These were detailed plans?

Capt. PRATT. Well, let us say the basic conception of the planning. The details could have been carried out more promptly.

The CHAIRMAN. You had been to the Naval War College, Capt. Pratt?

Capt. PRATT. Yes, sir.

The CHAIRMAN. In time of peace do you not think it would be wise to appoint a graduate of the Naval War College as Chief of Operations?

Capt. PRATT. I think the Chief of Naval Operations should always have been a graduate of our war college.

The CHAIRMAN. And especially so if there were a war impending?

Capt. PRATT. Oh, yes.

The CHAIRMAN. In your direct testimony you made the following statement:

"To administer this department, there is called a civilian—and under no circumstances should the supervisory head be other than a civilian—a splendid man, able, efficient, highly trained in some subjects, but not technically trained in the activities of the Navy nor a student in the art of war. This system functions after a fashion in peace, but it does not function when preparation for war becomes necessary, nor does it function in war. It is necessary that at the outbreak of hostilities the military head should assume the direction of and responsibility for the conduct of military operations for whose preparation he has had by law no direct control nor authority to coordinate in peace. Such is the system we work under to-day, and did at the outbreak of the war. Thanks to the voluntary cooperation of every district departmental organization, including the Secretary, the Navy was able to pull itself together and to work exceedingly well in war.

"If any lack of preparation existed within the Naval Service prior to our entry into the war, if any lack of harmony existed then or exists now within our Navy, it can be laid more justly to the system of organization the department labors under than upon the shoulders of any individual."

That is a quotation from your testimony?

Capt. PRATT. Yes, sir.

The CHAIRMAN. It would appear from this that the organization of the Navy Department prior to the World War was by no means perfect and should be changed. Is that your opinion?

Capt. PRATT. That is, sir. I think the organization is not fitted to conduct war efficiently.

The CHAIRMAN. And also prior to our going into the war?

Capt. PRATT. Oh, yes.

The CHAIRMAN. Are you familiar with the general plan of organization proposed by the Mahan-Moody Commission and the Swift Board and the aid system, all of which sought to coordinate departmental agencies under the Secretary?

t. PRATT. It looks to me as though we had given advance

CHAIRMAN. And we could have laid down any program we d without its constituting an overt act?

t. PRATT. I should think so.

CHAIRMAN. You have said in your statement:

behind all these details there must be the determination of a united people, ed through the proper authorities, that they desire and will declare war within n specified limit of time, and that within this limit of time they will give, the proper channels, to their military leaders the power and means to so and organize that at the appointed time these organizations may strike.

you tell me exactly what that means? Do you think that ess should declare war one year from date?

t. PRATT. Well, of course not; but take the history, compare istory of the British Empire and the German Empire. The an Empire does not say she is going to declare war, but a few se who are on the inside probably know that that is exactly they are preparing for, and when that spirit exists and when iver exists in the hands of the ruler or the heads to bring that to pass, it is an easy matter to determine when and how you rike. Now, they have never been able, so far as I know, to do n Great Britain, and the history of our past wars, I think, bears irly well the fact that we are never quite ready at the begin-

We do not want to have that power. It is fundamentally a f the spirit.

CHAIRMAN. But you state that "behind all these details there be the determination of a united people." That could take in ountry, could it not?

t. PRATT. Oh, yes.

CHAIRMAN. And you continue, "expressed through the proper rities." What would that mean in the case of this country?

t. PRATT. You gentlemen have a deciding head.

CHAIRMAN. No; but I want you to explain to me just what lea means. Whom do you mean when you say "expressed gh the proper authorities"?

t. PRATT. I mean those authorities who have the right to e war.

CHAIRMAN. That is Congress?

t. PRATT. Yes, sir.

CHAIRMAN. And you say "that they desire and will declare ithin a certain specified limit of time." Say, one year?

t. PRATT. Yes, sir.

CHAIRMAN. Then you would say that Congress should meet elare war within one year from a specified date?

t. PRATT. Let me explain what I mean by that. Let us start out with a nation in peace. We see that certain acts are being itted against us, because I do not think that the spirit of this y would ever permit us to say, "We will plan deliberately to e the territory of some country or to commit aggressive acts t her." But let us say that things have been running on to pass that we feel that we must, to support our honor, do cer-efinite things which amount or lead to war. Then, if we want thoroughly prepared, so that we strike at once, there must be horough understanding between all the Government depart-

The CHAIRMAN. But you do not know of any principle of international law that would forbid a nation to increase its navy if it saw fit?

Capt. PRATT. No.

The CHAIRMAN. Without committing an act against neutrality?

Capt. PRATT. No, sir; I think it is perfectly legitimate, unless the increase is so evidently directed at a particular country that you can not avoid having that country make a protest.

The CHAIRMAN. But, Captain, as a student of international law, even in such a case you would not say that there was any rule of international law prohibiting it, would you?

Capt. PRATT. No; you are quite right; not in defense, but as an aggressive act there might be some question.

The CHAIRMAN. It is not an aggressive act simply to prepare and to build? The aggressive act would come afterwards, would it not, in using the prepared Navy?

Capt. PRATT. Well, let me perhaps note a difference. If Germany had built a navy and had created military forces sufficient to have guarded her own boundaries, no one could protest at that; but if she were to build up a military organization which she is evidently planning to use for some specific purpose, that I believe is going beyond the strict rights of a neutral nation.

The CHAIRMAN. Then you would say in every case that the building of a naval program should be practically agreed to by all friendly nations?

Capt. PRATT. By no means.

The CHAIRMAN. Or by any friendly nation?

Capt. PRATT. Oh, no. We have a perfect right to lay our cards right on the table and say what we will do. If we have made a statement to the effect that we will use everything in our power to preserve our rights of neutrality, then I believe we have a right to increase our power just so far as we will, if we have given advance notice of what we are going to do, to protect ourselves.

The CHAIRMAN. As a matter of fact, you would not have to give any advance notice at all. We have a perfect right to do anything we want to do in the line of building, and if another nation did not like it they could protest or not as they saw fit; but it is not an overt act, an act of war, is it?

Capt. PRATT. As I said before, I draw the line between preparation for defense and preparation which oversteps the mark and becomes an aggressive act. I suppose that is a hypothetical question, is it not; that is, it is one of these questions where you are assuming two countries at peace?

The CHAIRMAN. Yes.

Capt. PRATT. Yes.

The CHAIRMAN. I am assuming the state of affairs that existed before we went into the war.

Capt. PRATT. Oh, that is a little different, I think. Under those circumstances I think we had given ample notice to the effect that we would protect our neutrality to the utmost. It seems to me that we had very frequently stated so, and that being the case, I see no reason why we could not have——

The CHAIRMAN. Laid down any plans of a building program we wanted?

Capt. PRATT. It looks to me as though we had given advance notice.

The CHAIRMAN. And we could have laid down any program we wanted without its constituting an overt act?

Capt. PRATT. I should think so.

The CHAIRMAN. You have said in your statement:

But behind all these details there must be the determination of a united people, expressed through the proper authorities, that they desire and will declare war within a certain specified limit of time, and that within this limit of time they will give, through the proper channels, to their military leaders the power and means to so prepare and organize that at the appointed time these organizations may strike.

Can you tell me exactly what that means? Do you think that Congress should declare war one year from date?

Capt. PRATT. Well, of course not; but take the history, compare the history of the British Empire and the German Empire. The German Empire does not say she is going to declare war, but a few of those who are on the inside probably know that that is exactly what they are preparing for, and when that spirit exists and when the power exists in the hands of the ruler or the heads to bring that spirit to pass, it is an easy matter to determine when and how you will strike. Now, they have never been able, so far as I know, to do that in Great Britain, and the history of our past wars, I think, bears out fairly well the fact that we are never quite ready at the beginning. We do not want to have that power. It is fundamentally a case of the spirit.

The CHAIRMAN. But you state that "behind all these details there must be the determination of a united people." That could take in this country, could it not?

Capt. PRATT. Oh, yes.

The CHAIRMAN. And you continue, "expressed through the proper authorities." What would that mean in the case of this country?

Capt. PRATT. You gentlemen have a deciding head.

The CHAIRMAN. No; but I want you to explain to me just what the idea means. Whom do you mean when you say "expressed through the proper authorities"?

Capt. PRATT. I mean those authorities who have the right to declare war.

The CHAIRMAN. That is Congress?

Capt. PRATT. Yes, sir.

The CHAIRMAN. And you say "that they desire and will declare war within a certain specified limit of time." Say, one year?

Capt. PRATT. Yes, sir.

The CHAIRMAN. Then you would say that Congress should meet and declare war within one year from a specified date?

Capt. PRATT. Let me explain what I mean by that. Let us start right out with a nation in peace. We see that certain acts are being committed against us, because I do not think that the spirit of this country would ever permit us to say, "We will plan deliberately to absorb the territory of some country or to commit aggressive acts against her." But let us say that things have been running on to such a pass that we feel that we must, to support our honor, do certain definite things which amount or lead to war. Then, if we want to be thoroughly prepared, so that we strike at once, there must be that thorough understanding between all the Government depart-

ments and the authorities who can declare war, so that there will be no indecision on the part of the Navy or the Army as to exactly what steps they must take to get ready, and those who provide the funds must give the funds for it.

The CHAIRMAN. Then you do not mean that they must declare war at any future time, or state that they intend to declare war?

Capt. PRATT. No; they must have such a thorough understanding.

The CHAIRMAN. That is, a secret understanding. An open understanding would give too much information to the enemy, would it not?

Capt. PRATT. An open understanding would; but I would rather do it in the open, myself.

The CHAIRMAN. Then what would happen under an open understanding, that the enemy with whom we proposed to fight, if we gave her a year's notice that we were preparing, would fight at a certain time?

Capt. PRATT. I have mentioned that contingency, or indirectly mentioned it once before, that to prepare ourselves I think our fleet must be so strong and so well prepared that we, behind it, can always develop our full power to wage war.

The CHAIRMAN. But even at that, the year's notice would give the other side quite an opportunity to get ready.

Capt. PRATT. You should not have a year's notice with the fleet. The fleet should be always ready.

The CHAIRMAN. No, I say a year's notice of your intention to declare war. It is rather an interesting idea. I wanted you to develop it, that is all.

Capt. PRATT. I understand; it is an interesting idea. Now, a great many people thought Germany was going to declare war. It was talked of abroad, and yet she went right on building up, and Great Britain had not increased her army, with all the warning she had. Her fleet was always ready, but the rest of her military resources were still undeveloped when she went into the war. That has been her history, and I think that is liable to be our history.

The CHAIRMAN. But in the World War there was no country that intended to make war or that gave notice through their proper authorities that they were to go to war, was there? Germany had a date fixed, but she did not make it public?

Capt. PRATT. Oh, that is true. I do not mean we should make our own dates public. I mean that if you want to have the Navy and the Army ready to go to war, it is not necessary for you to openly say so, but you have got to thoroughly understand that that is what you intend to do.

The CHAIRMAN. But this does not say to have your Army and Navy ready, necessarily. It says, "that they desire and will declare war within a certain specified limit of time." That is more than having their army and navy ready for defense.

Was Germany's submarine campaign developed in 1915 and 1916 sufficiently to indicate to naval experts the general lines along which preparations to meet it should be made?

Capt. PRATT. I do not believe I can answer that question definitely, because we had to learn as war progressed exactly how we would meet the necessity?

Capt. PRATT. And then the three of us who were in the planning department just went at it.

The CHAIRMAN. And made these memoranda that you have already referred to in your testimony?

Capt. PRATT. Yes, from our general knowledge of the situation.

The CHAIRMAN. But there was no specific plan that finally went to the Secretary for his approval?

Capt. PRATT. Not that I know of. I have never seen one.

The CHAIRMAN. Did all of the bureaus know exactly what to do and how to expend the money wisely, as soon as war was declared?

Capt. PRATT. I can not answer that question, because I do not know.

The CHAIRMAN. That would be part of the general plan, would not it?

Capt. PRATT. It should be.

The CHAIRMAN. Now, I want to take up the question of the sending of the letter by Admiral Sims. This letter was an official communication, was it not, from the admiral to the Secretary of the Navy?

Capt. PRATT. You mean the letter

The CHAIRMAN. The letter of January 7, 1920.

Capt. PRATT. I suppose it was.

The CHAIRMAN. I think there is no question about that.

Capt. PRATT. I think there is no question about it.

The CHAIRMAN. And it was brought out at the request of the subcommittee on Naval Awards.

Capt. PRATT. I believe that is true.

The CHAIRMAN. And was not made public by Admiral Sims except at the request of the subcommittee?

Capt. PRATT. I understand that is so.

The CHAIRMAN. There is no criticism in the letter, so far as you know, of the Navy itself or any officer of the Navy?

Capt. PRATT. I have read it carefully and I do not see any criticism.

The CHAIRMAN. But he does point out the magnificent achievements of the Navy during the war?

Capt. PRATT. Yes. I will correct that by saying no person by name; but of course there is a criticism of certain operations of the war which naturally reflects upon the officer in charge of operations; it is no personal mention of anyone by name.

The CHAIRMAN. And he speaks specifically about the fine work that was done by the Navy after the department had organized and things were running along properly?

Capt. PRATT. Oh, yes; he speaks of that.

The CHAIRMAN. And what he finds fault with principally is the faulty principle of organization in the Navy, the lack of preparation, the indecision and procrastination by the department, which prevented officers from quickly using ships, men, and material against the enemy? I am simply asking you to see whether this is your idea of the letter.

Capt. PRATT. Yes; that is my idea.

The CHAIRMAN. And he did not indulge in personalities, as you say?

Capt. PRATT. No, sir; he did not.

The CHAIRMAN. And was not the purpose of the letter to insure a better national security by preventing a future repetition of the errors and delays of 1916?

Capt. PRATT. I do not know that, sir. I know nothing about that.

The CHAIRMAN. Either the department or Congress?

Capt. PRATT. I know nothing about that, sir, because I did not come into the office at all in any active degree until after February, 1917. I had never been on duty in Washington before.

The CHAIRMAN. Do you know anything about the plan submitted by Capt. Laning to Admiral Benson after the outbreak of the war?

Capt. PRATT. A plan about what, sir?

The CHAIRMAN. A general plan—war plan?

Capt. PRATT. No. Capt. Laning was in Admiral McKean's department. He would know about that. He can answer that.

The CHAIRMAN. You do not know about that?

Capt. PRATT. I do not know about that, no, sir.

The CHAIRMAN. You do not know about any plan of Capt. Laning that Admiral Benson referred to Capt. Schofield to be amplified?

Capt. PRATT. No, sir; I do not recall any.

The CHAIRMAN. Did the office of operations have a plan when you went in as aid—a war plan?

Capt. PRATT. We had a number of plans which we evolved as it became necessary. If that means a basic plan, such a plan is of more use in preparing themselves for the war than it is for actually carrying war on, because the basic plan had to be altered continually as the conditions change.

The CHAIRMAN. You had no particular base plan that was altered as conditions changed?

Capt. PRATT. No, sir, not that I was familiar with.

The CHAIRMAN. Does not the law give to the Bureau of Operations the responsibility of preparing plans for war? Or, if you do not want to use the word "responsibility", is not that a part of the duty of the Bureau of Operations under the act of Congress?

Capt. PRATT. Yes, it is; and that is just exactly one of the points that I have never been able to quite settle in my mind. The general board is responsible for plans. The Office of Operations is responsible for plans. And there was not any real planning section in Operations; and that is why I say there is something the matter with the system.

The CHAIRMAN. Well, regardless of the general board or of what they should have done, should not Operations have had its plans, also?

Capt. PRATT. Yes, we should have had a planning section.

The CHAIRMAN. You did have a planning section.

Capt. PRATT. Yes, but it was a pretty small one.

The CHAIRMAN. When was the first general plan that Operations got out and put up to the Secretary for his approval?

Capt. PRATT. I personally do not know.

The CHAIRMAN. When was the first one that you know anything about?

Capt. PRATT. The first thing that I know anything about was, as I said, this letter of February 10th, written by Capt. Chase and asking the general board to prepare a plan or to modify the original plan.

The CHAIRMAN. That was lost, was it not?

Capt. PRATT. That was lost.

The CHAIRMAN. The plan that was made was lost.

Capt. PRATT. And then the three of us who were in the planning department just went at it.

The CHAIRMAN. And made these memoranda that you have already referred to in your testimony?

Capt. PRATT. Yes, from our general knowledge of the situation.

The CHAIRMAN. But there was no specific plan that finally went to the Secretary for his approval?

Capt. PRATT. Not that I know of. I have never seen one.

The CHAIRMAN. Did all of the bureaus know exactly what to do and how to expend the money wisely, as soon as war was declared?

Capt. PRATT. I can not answer that question, because I do not know.

The CHAIRMAN. That would be part of the general plan, would it not?

Capt. PRATT. It should be.

The CHAIRMAN. Now, I want to take up the question of the sending of the letter by Admiral Sims. This letter was an official communication, was it not, from the admiral to the Secretary of the Navy?

Capt. PRATT. You mean the letter ---

The CHAIRMAN. The letter of January 7, 1920.

Capt. PRATT. I suppose it was.

The CHAIRMAN. I think there is no question about that.

Capt. PRATT. I think there is no question about it.

The CHAIRMAN. And it was brought out at the request of the Subcommittee on Naval Awards.

Capt. PRATT. I believe that is true.

The CHAIRMAN. And was not made public by Admiral Sims except at the request of the subcommittee?

Capt. PRATT. I understand that is so.

The CHAIRMAN. There is no criticism in the letter, so far as you know, of the Navy itself or any officer of the Navy?

Capt. PRATT. I have read it carefully and I do not see any criticism.

The CHAIRMAN. But he does point out the magnificent achievements of the Navy during the war?

Capt. PRATT. Yes. I will correct that by saying no person by name; but of course there is a criticism of certain operations of the war which naturally reflects upon the officer in charge of operations; but no personal mention of anyone by name.

The CHAIRMAN. And he speaks specifically about the fine work that was done by the Navy after the department had organized and things were running along properly?

Capt. PRATT. Oh, yes; he speaks of that.

The CHAIRMAN. And what he finds fault with principally is the faulty principle of organization in the Navy, the lack of preparation, the indecision and procrastination by the department, which prevented officers from quickly using ships, men, and material against the enemy? I am simply asking you to see whether this is your idea of the letter.

Capt. PRATT. Yes; that is my idea.

The CHAIRMAN. And he did not indulge in personalities, as you say?

Capt. PRATT. No, sir; he did not.

The CHAIRMAN. And was not the purpose of the letter to insure a greater national security by preventing a future repetition of the errors and delays of 1916?

Capt. PRATT. I have always accepted that myself as being the reason of the letter.

The CHAIRMAN. Do you not think that the admiral had the right to address such a letter to the Secretary of the Navy?

Capt. PRATT. I think he had a perfect right to address it to the Secretary of the Navy.

The CHAIRMAN. Is the Navy Department the Navy?

Capt. PRATT. No, sir; the Navy Department is the controlling head of the Navy.

The CHAIRMAN. Do you think it is possible to criticize the department without criticizing the Navy?

Capt. PRATT. Oh, yes.

The CHAIRMAN. Might not the Navy Department or the Secretary of the Navy who rules the policies of the department prevent preparedness and prevent quick action in time of war if he saw fit to do so?

Capt. PRATT. I think, under the present system, it would be possible.

The CHAIRMAN. Might not a criticism of the Navy Department and its policies be a defense of the Navy, and the defense of its officers, against the possible charge of neglect on their part to prepare and act promptly?

Capt. PRATT. I suppose it could be looked at in that way.

The CHAIRMAN. Then where can you find any justification in the charge that has been made by certain of the witnesses who have come before us, that Admiral Sims had attacked the good name of the Navy or reflected upon its officers, when he merely points out the defects and errors of organization and administration of the Navy Department?

Capt. PRATT. Of course this is my opinion only.

The CHAIRMAN. Yes; that is what I want.

Capt. PRATT. I feel that had he omitted that accusation which I pointed out as a grave one, that the Navy was responsible for the loss of so many ships and so many lives, there would not have been so much feeling aroused in the service. I can not help feeling that that was a loose statement.

The CHAIRMAN. If he had said "The Navy Department," would that have changed that, in your opinion?

Capt. PRATT. No, sir; because after all, we can not draw a line between the Navy Department and the rest of the Navy. We want to be one big service and we want to work thoroughly as a band of brothers; so that if you are going to draw a line of demarkation between the Navy Department and the Navy proper, there will always be lack of harmony.

The CHAIRMAN. But might the Navy not be itself all on tenter-hooks, ready to do anything that they could, and the Department hold them back?

Capt. PRATT. Of course that is true.

The CHAIRMAN. In which case the men of the Navy who were ready would not be to blame, but the Department, who controlled its policy and held them back, would be responsible?

Capt. PRATT. Yes; if the Department held them back, that state of affairs would be true, naturally.

the CHAIRMAN. When you came in, who seemed to be the leading person in the department, the Secretary, or Admiral Benson, or who? Capt. PRATT. Why, the Secretary must always be the head; and he should or ought to be guided by the advice that the Chief of Naval Operations would give him. Now, just to what extent he influenced the Secretary, I could not say.

the CHAIRMAN. When the question came up of acting, was it really the Secretary that inspired action, or some officer of the department?

Capt. PRATT. To act as an inspiration requires a great deal of inventive genius, and one must have a great deal of imagination to see these things. A departmental organization may be very good and may run along well; but the heads have got to be free to look along broader lines. I have felt that if there was a lack, if there might be a lack of a broader point of view, it is due to a system which puts a great many of the details upon the responsible heads, not giving them time enough to take up the broader point of view. I think that was the failing, perhaps is the failing to-day of the Government, very much as ex-Secretary Lane has expressed it. I think his criticism of the departmental organizations in Washington is very true, and that we all labored under—at least the department of the Navy labored under—certain disadvantages which he has set out.

the CHAIRMAN. I hope that in the plan you are going to submit that you will go into that question for future reference.

Capt. PRATT. Yes, sir; I have outlined it. I have not discussed it very much, but simply to arrive at a decision; but I will embody

the CHAIRMAN. Would you say that the statement of the Secretary of the Navy in his report for 1918, that the Navy was prepared from stem to stern when war was declared, was justified?

Capt. PRATT. That, I think, would be more in the nature of a question of speech. No; as a naval man, having to handle an organization, say, to go out and fight the next day, I would hardly say that we were fit from stem to stern.

the CHAIRMAN. Was the Navy ready for war, would you say, as far as personnel, when war was declared?

Capt. PRATT. Not the way I would like to see it.

the CHAIRMAN. In the early stages of the war, were our operations ever delayed because of lack of personnel, or material conditions of the ships—poor material conditions of the ships?

Capt. PRATT. Well, I do not know, between April 6 and June 25, before that date I was not held up; but before that date Capt. Chase and Admiral Benson would have to speak for themselves, whether personnel and material held the sailing of the ships up. I do not know, between April 6 and June 25. But I was not held up for lack of personnel after that, to an extent that prohibited our operating.

the CHAIRMAN. But it would necessarily change the form of your operations, if you were short of personnel, would it not?

Capt. PRATT. It was necessary to make adjustments with personnel.

the CHAIRMAN. Now, if there was a lack of preparedness in personnel when the war started, whose fault was that?

The CHAIRMAN. I asked you the other day a question more or less of this same kind, and I think you stated that there were rumors about the matter, but you did not state what sort of rumors. Can you tell me what sort of rumors were around?

Capt. PRATT. Why, the Secretary has not always been popular in the service, and it is rumored that he has held up papers, and lost them. Admiral Benson is not altogether popular with many people, and you could hear those rumors; and I can not recall now, but I know such rumors existed. But for me to state as a fact that those things existed——

The CHAIRMAN. I did not ask you as a fact. I asked you if there was a general feeling in the department about the matter?

Capt. PRATT. I can not say that the feeling is general. I simply know that the things I have stated have been spoken of.

The CHAIRMAN. And you prefer not to answer the question whether there was a general feeling?

Capt. PRATT. Because I do not know that. It seemed to me that within the department the feeling was more or less cordial. It is outside of the department more than inside that that feeling existed. I thought.

The CHAIRMAN. It is not a question of cordiality. It was simply a question of fact, as to whether matters were being held up, and preparedness was going along slowly.

Capt. PRATT. That is just what I tried to confine myself to, is the question of fact. I was not, as I said, thrown into contact with the Secretary until I became Acting Chief of Naval Operations, and I tried to think up some cases where he had held me up, and he never held me up.

Senator TRAMMELL. Mr. Chairman, I think if you are going to inquire into rumors, or insist on his stating about rumors, he ought to be permitted to say what his own experience was and what his own idea was so far as his connection with the department himself was.

The CHAIRMAN. He has already done that. I have no objection in the world.

Senator TRAMMELL. I thought you objected to it. You said that it was not a matter of cordiality, congeniality, or courtesy at all.

The CHAIRMAN. That was purely explanatory.

Senator TRAMMELL. There is as much in courtesy and congeniality and cordiality as there is in rumors. Rumors are mighty bad things. If all rumors were true, all of us would be in the penitentiary, instead of being on this committee, I expect. I think I would.

The CHAIRMAN. Then, as far as you know, prior to your going in as aid for Operations, the Secretary was acting with the wisdom and foresight and force of a great executive?

Capt. PRATT. I would not say that, either. I will say I do not know.

The CHAIRMAN. When you came in did you find any feeling in the Bureau of Operations that indicated a failure of the secretary to realize the necessity of acting forcibly and quickly in an emergency?

Capt. PRATT. No; I am ignorant about that. Admiral Benson would not discuss with me those things; and he, of course, is the one man who knows just whether things were held up or whether they were not, and he would not discuss that with me.

The CHAIRMAN. When you came in, who seemed to be the leading spirit in the department, the Secretary, or Admiral Benson, or who?

Capt. PRATT. Why, the Secretary must always be the head; and he must or ought to be guided by the advice that the Chief of Naval Operations would give him. Now, just to what extent he influenced the Secretary, I could not say.

The CHAIRMAN. When the question came up of acting, was it generally the Secretary that inspired action, or some officer of the department?

Capt. PRATT. To act as an inspiration requires a great deal of creative genius, and one must have a great deal of imagination to foresee these things. A departmental organization may be very sound and may run along well; but the heads have got to be free to work along broader lines. I have felt that if there was a lack, if there might be a lack of a broader point of view, it is due to a system which throws a great many of the details upon the responsible heads, not leaving them time enough to take up the broader point of view. I think that was the failing, perhaps—is the failing to-day—of the system, very much as ex-Secretary Lane has expressed it. I think that his criticism of the departmental organizations in Washington is very true, and that we all labored under—at least the department of the Navy labored under—certain disadvantages which he has set forth.

The CHAIRMAN. I hope that in the plan you are going to submit to us you will go into that question for future reference.

Capt. PRATT. Yes, sir; I have outlined it. I have not discussed it very much, but simply to arrive at a decision; but I will embody that.

The CHAIRMAN. Would you say that the statement of the Secretary of the Navy in his report for 1918, that the Navy was prepared from stem to stern when war was declared, was justified?

Capt. PRATT. That, I think, would be more in the nature of a figure of speech. No; as a naval man, having to handle an organization, say, to go out and fight the next day, I would hardly say that we were fit from stem to stern.

The CHAIRMAN. Was the Navy ready for war, would you say, as to personnel, when war was declared?

Capt. PRATT. Not the way I would like to see it.

The CHAIRMAN. In the early stages of the war, were operating plans ever delayed because of lack of personnel, or material conditions of the ships—poor material conditions of the ships?

Capt. PRATT. Well, I do not know, between April 6 and June 25. After that date I was not held up; but before that date Capt. Chase and Admiral Benson would have to speak for themselves, whether personnel and material held the sailing of the ships up. I do not know, between April 6 and June 25. But I was not held up for lack of personnel after that, to an extent that prohibited our operating.

The CHAIRMAN. But it would necessarily change the form of your operations, if you were short of personnel, would it not?

Capt. PRATT. It was necessary to make adjustments with personnel.

The CHAIRMAN. Now, if there was a lack of preparedness in personnel when the war started, whose fault was that?

Capt. PRATT. As the system of organization stands to-day, the Secretary is responsible, sharing a degree of responsibility with whomsoever advises him to commit himself to a policy of inadequate personnel. I consider that any naval officer that advised the Secretary that it was efficient to have an insufficient personnel, must be held responsible for the advise he gives.

The CHAIRMAN. You would not lay the responsibility to Congress provided the Secretary had not put the matter up to them?

Capt. PRATT. I can not see how Congress is responsible.

The CHAIRMAN. Do you think that the department did everything that could have been done after Ambassador Bernstorff had been given his passports, to prepare the Navy, and up to the time war was declared on April 6, 1917?

Capt. PRATT. I do not know enough about that to want to say. I could only give opinions in the matter. Admiral Benson, who, of course, must know definitely, I think could state as to facts.

The CHAIRMAN. What is your opinion: that everything was done that could have been done to prepare the Navy between those dates?

Capt. PRATT. Why, of course, if a man wants to get in and drive, nothing is impossible.

The CHAIRMAN. Was not that a time to drive?

Capt. PRATT. If you ask me personally, I certainly would.

The CHAIRMAN. And you do not think there was much driving?

Capt. PRATT. I do not know.

The CHAIRMAN. Or do you think there was much driving?

Capt. PRATT. It seems to me that the facts pretty well speak for themselves; that if we had intended to immediately dispatch our destroyers abroad, we could have had them in material shape, thoroughly manned to the minute. That is not an impossible thing to do; and if it was not done, it is because steps were not taken to get them ready for it. It could have been done, I believe.

The CHAIRMAN. And the same with other operations, or possible operations?

Capt. PRATT. Yes; I think we could have had our cruisers manned; but the question of getting the yachts and the other submarine craft was more difficult. They had to be commandeered and fitted out. I think the delay in fitting them out was harder to overcome than any personnel delay. They are boats that are not adapted to war purposes, and have to be altered very materially, and guns put on them.

The CHAIRMAN. Should we not have had the personnel of the fleet trained so that we would not have had to break into them for armed guards, or so that after we had broken in they would still have had an adequate personnel on board?

Capt. PRATT. If we had had enough personnel in the Navy, it would not have been necessary to have broken into the fleet. We could have drawn the armed guard from other sources, which was done to some extent later. We drew the armed guard from shore bases as well as from the fleet.

The CHAIRMAN. Was there any time in the early stages of the war when there was a lack of funds to provide types of vessels that were needed against submarines, after we had gone into the war?

Capt. PRATT. I do not know that. I did not handle funds. What is that? Was there any lack of funds?

The CHAIRMAN. Was there any lack of funds in the early stages of the war to provide types of vessels that were needed against submarines? You say you do not know?

Capt. PRATT. I do not know. I think Admiral McKean can look that up.

The CHAIRMAN. Do you know, either directly or indirectly, of any attitude of the Secretary of the Navy or any other Navy Department official that in any way tended to reduce the possible efficiency of the Navy in carrying on the war?

Capt. PRATT. Why, no; when we got into the war it seemed to me that the desire to wage it successfully was just as strong as the desire to keep out of war before we got it.

The CHAIRMAN. In your statement you have said that owing to previous lack of material and personnel it was not possible to place the naval forces in the war zone ready to operate as soon as desired. Who was responsible for this lack of preparation that rendered our forces incapable of quick action?

Capt. PRATT. The Secretary, of course, was the responsible head.

The CHAIRMAN. And had we no warning, you say, of war?

Capt. PRATT. Why, when you send an ambassador out of the country, that is always to my mind warning enough.

The CHAIRMAN. And also the sinking of the *Lusitania* was in the nature of a warning, was it not?

Capt. PRATT. Oh, yes.

The CHAIRMAN. You also say that neither the organization nor the administration of the department was such that it lent itself to efficient handling of a great war at the beginning. Why was the organization and administration defective?

Capt. PRATT. I think I have explained that in the last part of my prepared statement. It was principally due, to my mind, to the lack of a coordinating military head upon whom definite responsibility is placed.

The CHAIRMAN. And who was responsible for that?

Capt. PRATT. The laws under which the department was organized.

The CHAIRMAN. And if the plan that was put up to Congress and which was finally enacted into law had been left as it was put up, with the responsibility on the Chief of Operations, would not that have been remedied?

Capt. PRATT. Yes, it would have helped a great deal.

The CHAIRMAN. So, if we had made an attempt to anticipate the war, the organization and the administration of the department would have been made ready to function?

Capt. PRATT. I think so, for this reason. The military head, say the Chief of Naval Operations, makes a definite study, or he has his studies submitted to him. He goes to the Secretary and he says, "Mr. Secretary, it is absolutely necessary that we do certain things." Then if the Secretary does not agree to that, he assumes that responsibility himself, and it is nothing more than proper for the Chief of Naval Operations to say, "I must leave, sir—leave office—and you must find another man." That, of course, would bring an immediate show-down, which is what is needed under all such cases.

The CHAIRMAN. You have stated that in order to make our organization effective under conditions as they were in the war, the entire building program would have had to be

more regular officers and more of the regular enlisted men in proportion than the other types in the service were.

The CHAIRMAN. That was at the commencement of the war?

Capt. PRATT. At the very commencement. Of course it was also true, in fact, because our cruisers were not manned, and older battleships were not fully manned, and his vessels as they came over to him were fully manned, and throughout the war he had trained officers and men in proportion to the other types in service than existed elsewhere.

The CHAIRMAN. After Admiral Mayo's forces came north of the West Indies in 1917, was it not necessary to take nearly one-third of the officers and many of the men out of each of the battleships and man other vessels?

Capt. PRATT. I do not know the proportion, but it was necessary to take quite a number of the officers and men out of the battleships.

The CHAIRMAN. That made the battleship force unreadiness for battle, did it not?

Capt. PRATT. They were not in the pink of condition, of course, after the trained officers and men were taken from them.

The CHAIRMAN. And such a condition should not be allowed to exist in the future, should it?

Capt. PRATT. Oh, no; it is not wise to allow a condition of that sort to exist?

The CHAIRMAN. After the *Lusitania* was sunk, would you say that it would have been common prudence to man the ships of the Navy and mobilize the fleet in the Atlantic in 1916?

Capt. PRATT. Yes, I would like to have seen it done.

The CHAIRMAN. Did the Secretary give instructions to operate so far as you know, in 1916, to mobilize the fleet?

Capt. PRATT. I do not know.

The CHAIRMAN. Or to prepare the Navy for war?

Capt. PRATT. I do not know, sir. I was not in the department at that time.

The CHAIRMAN. Did the Secretary, to your knowledge, ever suggest to himself or urge others to exert themselves to prepare for war when war was practically upon us, so far as you know?

Capt. PRATT. I do not know that, sir.

The CHAIRMAN. He did not, so far as you know?

Capt. PRATT. He did not; and neither could I say that he did not. I do not know.

The CHAIRMAN. Is not an efficient air service important?

Capt. PRATT. Yes, sir.

The CHAIRMAN. Did we have it?

Capt. PRATT. We did not.

The CHAIRMAN. Would not such a service have been of great value against submarines in protecting our coast and fleet?

Capt. PRATT. Better than protecting our coast and fleet. If we had had it we could have sent them abroad immediately, wherever they were needed. We did not need much on this point. The place for all antisubmarine craft——

The CHAIRMAN. Was on the other side?

Capt. PRATT. Was on the other side, with very, very few exceptions. We were called upon through agreements with the Ar-

ain a few antisubmarine craft on this side. We had to do even though they would have been tactically more efficient on the other side. That is because it was not——

CHAIRMAN. You do not think that we ever had to make preparation for submarines on this side?

MR. PRATT. No, I do not think we needed to worry very much about that at all, except the question of being prepared for their attacks.

CHAIRMAN. What is that?

MR. PRATT. The mine layers; the mine laying submarines. That is the only effective operation which they performed on this side, the laying of mines on our coast. We lost quite a number of our ships by mines.

CHAIRMAN. That was the only thing we had to fear?

MR. PRATT. That was the only thing we needed to worry about, as submarines were concerned.

CHAIRMAN. And that was so at the beginning of the war; the thing that we needed to fear?

MR. PRATT. I looked upon that exactly the same way.

CHAIRMAN. If an efficient air service was urged by Admiral Clegg and the General Board in 1913, who was responsible for the fact that we did not have it in 1917?

MR. PRATT. I do not know that, sir. Admiral McKean says that he can answer that question.

CHAIRMAN. If the Secretary of the Navy cut the estimates \$13,000,000 as recommended, to \$2,000,000, would you not say that he was responsible rather than Congress?

MR. PRATT. Of course; he is the deciding authority. He must assume the responsibility for all cuts that he makes in appropriations.

CHAIRMAN. In your written statement you admitted that we were unprepared for war, and you stated that the German fleet, having been blockaded by the Grand Fleet, we were free to make preparations with little danger of attack, did you not?

MR. PRATT. I did not hear the last part of your question, Mr. Chairman, on account of the noise.

CHAIRMAN. In your original statement you admitted that we were unprepared for war. I can quote your statement if you would like to.

MR. PRATT. Yes, sir.

CHAIRMAN. Do you want to have me quote it?

MR. PRATT. I made so many of them, I would like to know which you refer to. I made so many hypothetical statements.

CHAIRMAN. It is paragraph 10 of your statement. It reads as follows:

"Statement of fact in the paragraph correct, but the statement of the conclusion 'but without producing the desired result,' misleading and subject to question. It produced the desired effect at once and every effort was made to put naval forces desired in the war zone, but owing to our previous lack of preparation in material and personnel, it was not possible to place them at the front, and ready to use as soon as was desired. Nor was the organization or administration of the Government at home, such that it lent itself to the most efficient handling of a great war from the beginning."

Therefore I repeat that in your original statement you admitted, or not, that we were unprepared for war, and you stated that the German fleet having been blockaded by the Grand Fleet, we were free to make preparations with little danger of attack, did you not?

more regular officers and more of the regular enlisted men in proportion than the other types in the service were.

The CHAIRMAN. That was at the commencement of the war?

Capt. PRATT. At the very commencement. Of course that is also true, in fact, because our cruisers were not manned, and the older battleships were not fully manned, and his vessels as they went over to him were fully manned, and throughout the war he had more trained officers and men in proportion to the other types in the service than existed elsewhere.

The CHAIRMAN. After Admiral Mayo's forces came north from the West Indies in 1917, was it not necessary to take nearly one-half of the officers and many of the men out of each of the battleships to man other vessels?

Capt. PRATT. I do not know the proportion, but it was necessary to take quite a number of the officers and men out of the battleships.

The CHAIRMAN. That made the battleship force unready for battle, did it not?

Capt. PRATT. They were not in the pink of condition, of course, after the trained officers and men were taken from them.

The CHAIRMAN. And such a condition should not be allowed to exist in the future, should it?

Capt. PRATT. Oh, no; it is not wise to allow a condition of that sort to exist?

The CHAIRMAN. After the *Lusitania* was sunk, would you not say that it would have been common prudence to man the ships of the Navy and mobilize the fleet in the Atlantic in 1916?

Capt. PRATT. Yes, I would like to have seen it done.

The CHAIRMAN. Did the Secretary give instructions to operations so far as you know, in 1916, to mobilize the fleet?

Capt. PRATT. I do not know.

The CHAIRMAN. Or to prepare the Navy for war?

Capt. PRATT. I do not know, sir. I was not in the department at that time.

The CHAIRMAN. Did the Secretary, to your knowledge, ever exert himself or urge others to exert themselves to prepare for war until war was practically upon us, so far as you know?

Capt. PRATT. I do not know that, sir.

The CHAIRMAN. He did not, so far as you know?

Capt. PRATT. He did not; and neither could I say that he did not. I do not know.

The CHAIRMAN. Is not an efficient air service important?

Capt. PRATT. Yes, sir.

The CHAIRMAN. Did we have it?

Capt. PRATT. We did not.

The CHAIRMAN. Would not such a service have been of great use against submarines in protecting our coast and fleet?

Capt. PRATT. Better than protecting our coast and fleet. If we had had it we could have sent them abroad immediately. That is where they were needed. We did not need much on this coast. The place for all antisubmarine craft——

The CHAIRMAN. Was on the other side?

Capt. PRATT. Was on the other side, with very, very few exceptions. We were called upon through agreements with the Army to

CHAIRMAN. But it would have been imprudent, would it not, to withdraw many destroyers from the Grand Fleet for other reasons in view of the fact that the German fleet might come out at any time to attack?

C. PRATT. No. You have got to adjust and veer and haul. I think the British commander in chief would like to keep a number of ships which would insure him superiority over the German fleet type for type; but in war that is an impossible condition. He has got to be satisfied, I think, with a 60 per cent superiority; so that if the British has 60 per cent and the other man has 40 per cent, right straight away, when you size up the fleet as a whole he has got to be satisfied to engage. No matter how much he would like to have held his own with all of them--with the fleet, the Admiralty, of course, had to make its estimate of the situation and require that the Grand Fleet keep certain destroyers. Undoubtedly they endeavored to have the destroyers operate in purely antisubmarine movements as close to the Grand Fleet as possible, in order that they would always be in position to meet any lines with reference to the German fleet; that is, if the German fleet came out the British destroyers operating as antisubmarine craft could, at a pinch, under hurry orders, join in with the British Grand Fleet. I can not conceive of any other way in which they would get the requisite number of destroyers in case of action to cope with 198 of the Germans.

CHAIRMAN. But, at least, would you not think that they ought to keep as many as they could on hand to cope with them?

C. PRATT. Oh, yes; of course they should do that.

CHAIRMAN. And if you had been in command of the British fleet you would have been very loath, in view of possible attacks by the German fleet, to let any of them go?

C. PRATT. Yes, naturally. That is the commander in chief's

CHAIRMAN. Did not the destroyers of the Grand Fleet afford protection to our battleship division and to the North Sea mine operation also?

C. PRATT. Yes; to the mine barrage and also in convoy work. They operated there wherever they could. The Grand Fleet protected the Norwegian convoys that went across. The protection was usually by a division of battleships and a certain number of screening cruisers, and also screening destroyers had to go out with them so that to a certain extent they did operate against the submarines.

CHAIRMAN. I can not see, Captain, how you can justify the statement that you made in your testimony on Friday, that in view of the fact that the Grand Fleet was the main defense of the world against the victory of the German fleet, the destroyers of the Grand Fleet should have been used elsewhere.

C. PRATT. No; I did not exactly put it that way. I put it this way. We only held back on this coast, of destroyers, some 5 or 6 of the big ones, and a few of the smaller ones, and I put it this way. The submarine menace was so great, why, the British Grand Fleet, of course, would have had to have sacrificed 9 or 10, and they have done it.

CHAIRMAN. That was late in the season of 1917?

Capt. PRATT. Not so very late. We got our destroyers over submitted a table showing the time we got them over. Our destroyers were really the very first craft to go over there, and we got destroyers over there when we had nothing else.

The CHAIRMAN. We had some destroyers; yes.

Capt. PRATT. I have given the exact figures. I could read over again. Those dates show that the destroyers went over early.

The CHAIRMAN. They, of course, did not sail immediately April 6, 1917?

Capt. PRATT. No; I think six of them arrived during the first days of May.

The CHAIRMAN. May 4?

Capt. PRATT. Yes; six of them got there.

The CHAIRMAN. And 24 of them had arrived before the end of May?

Capt. PRATT. I had the exact figures and gave them.

The CHAIRMAN. Well, they arrived June 11.

Capt. PRATT. The point I made was that the British always maintained the balance of power, and could have adjusted their destroyer effort.

The CHAIRMAN. I think that possibly has already been put in.

Capt. PRATT. That has already been put in; yes, sir. That is better than any opinion, exactly what we did, and the tables show the dates.

The CHAIRMAN. Then your idea is that the British could have sent their destroyers?

Capt. PRATT. Oh, yes; could, and I think would have done it, in that situation had impressed them as being sufficiently grave to warrant it. I do not believe that the commander-in-chief of the grand fleet would have hesitated to go out into action, with the superiority of dreadnoughts and battle cruisers and light cruisers and flotilla leaders that he had. I do not think that he would have hesitated for one moment.

The CHAIRMAN. With very few destroyers?

Capt. PRATT. Oh, yes; he would not have hesitated even with a few destroyers. He had the Germans right where he wanted them. Their morale had been pretty well shattered by that time, I think.

The CHAIRMAN. Yes; but the testimony of some of the witnesses I think, has shown that in the spring of 1918 the Navy was looking for a great offensive on the part of the German Navy, was it not?

Capt. PRATT. We were looking for an offensive.

The CHAIRMAN. And that was after the date that you say we had their morale pretty well broken?

Capt. PRATT. Yes; but the fact remains that they never accepted it.

The CHAIRMAN. No; they did not.

Capt. PRATT. All that is, to my mind, rather conclusive evidence that the German morale had been pretty well shot to pieces at that time.

The CHAIRMAN. But of course that was not known at that time.

Capt. PRATT. No; it was not known; but the Germans ran, at Jutland. They turned tail and went in and never came out afterwards.

The CHAIRMAN. Do you not think it was better to bunch our available destroyers at Queenstown and along the French coast than to put them in service with the mine-laying fleet?

. PRATT. Oh, yes; that was wise. I think, to keep them at town and those other ports.

CHAIRMAN. And the best policy of cooperation did not demand they be scattered?

. PRATT. I think it was best to keep them together.

CHAIRMAN. You have stated that because we furnished only one-seventeenth of the antisubmarine craft operating in European waters, our influence in downing the submarine and in shortening the war was very inconsiderable?

. PRATT. Did I say inconsiderable?

CHAIRMAN. Very inconsiderable in proportion to what they did.

. PRATT. Well, our forces were inconsiderable in comparison with theirs.

CHAIRMAN. But you think that our coming in had a very considerable effect on it, do you?

. PRATT. No, sir; our entering the war had considerably more

CHAIRMAN. I mean on the submarine situation.

. PRATT. Oh, it had more effect than an actual comparison of forces would show. It had a very appreciable material effect and was one of the contributing causes toward helping to down the submarine. Our destroyers, ship for ship, were in better shape, I think, than the British.

CHAIRMAN. You think that the mere size of the reinforcement determines its influence?

. PRATT. No, sir; I do not think it does.

CHAIRMAN. Do you not think, for instance, if you had two teams that were practically even in strength, and one team had an extra man, it would make a difference?

. PRATT. It makes a great deal of difference.

CHAIRMAN. Do you not think that would make a great deal of difference--much more than one-twelfth?

. PRATT. Of course, it would; and I will tell you the reason I drew that just exactly as I did. It was because Admiral Sims in his original paper had laid so much stress on all the types that we have put in--submarines and yachts and all antisubmarine craft. So I treated the matter very much in the same manner as he treated it.

CHAIRMAN. Do you not think that if we could have thrown our destroyers and gunboats and antisubmarine craft that were not available, or that might be available if they had been thoroughly concentrated, in April, 1917, at the critical time, into the war over there, they would have contributed greatly to the moral effect?

. PRATT. The moral effect?

CHAIRMAN. Toward the ending of the war?

. PRATT. The moral effect, I agree with you, would have been a greater factor than possibly the material increase.

CHAIRMAN. And the moral effect is to be reckoned with, is it?

. PRATT. It is one of the strongest things you have to reckon with in war.

CHAIRMAN. Were all of the 1,700 British and allied destroyers and antisubmarine craft employed in British waters or along our coast in France?

Capt. PRATT. Not so very late. We got our destroyers over—submitted a table showing the time we got them over. Our destroyers were really the very first craft to go over there, and we had destroyers over there when we had nothing else.

The CHAIRMAN. We had some destroyers; yes.

Capt. PRATT. I have given the exact figures. I could read them over again. Those dates show that the destroyers went over fairly early.

The CHAIRMAN. They, of course, did not sail immediately on April 6, 1917?

Capt. PRATT. No; I think six of them arrived during the first few days of May.

The CHAIRMAN. May 4?

Capt. PRATT. Yes; six of them got there.

The CHAIRMAN. And 24 of them had arrived before the end of June?

Capt. PRATT. I had the exact figures and gave them.

The CHAIRMAN. Well, they arrived June 11.

Capt. PRATT. The point I made was that the British always held the balance of power, and could have adjusted their destroyer efforts.

The CHAIRMAN. I think that possibly has already been put in.

Capt. PRATT. That has already been put in; yes, sir. That shows better than any opinion, exactly what we did, and the tables show the dates.

The CHAIRMAN. Then your idea is that the British could have used their destroyers?

Capt. PRATT. Oh, yes; could, and I think would have done it, if the situation had impressed them as being sufficiently grave to warrant it. I do not believe that the commander-in-chief of the grand fleet would have hesitated to go out into action, with the superiority of dreadnoughts and battle cruisers and light cruisers and flotilla leaders that he had. I do not think that he would have hesitated for one moment.

The CHAIRMAN. With very few destroyers?

Capt. PRATT. Oh, yes; he would not have hesitated even with few destroyers. He had the Germans right where he wanted them. He had their morale pretty well shattered by that time, I think.

The CHAIRMAN. Yes; but the testimony of some of the witnesses, I think, has shown that in the spring of 1918 the Navy was looking for a great offensive on the part of the German Navy, was it not?

Capt. PRATT. We were looking for an offensive.

The CHAIRMAN. And that was after the date that you say we had their morale pretty well broken?

Capt. PRATT. Yes; but the fact remains that they never projected it.

The CHAIRMAN. No; they did not.

Capt. PRATT. All that is, to my mind, rather conclusive evidence that the German morale had been pretty well shot to pieces at that time.

The CHAIRMAN. But of course that was not known at that time!

Capt. PRATT. No; it was not known; but the Germans ran, after Jutland. They turned tail and went in and never came out afterwards.

The CHAIRMAN. Do you not think it was better to bunch our available destroyers at Queenstown and along the French coast in places rather than to put them in service with the mine-laying force?

Capt. PRATT. Oh, yes; that was wise. I think, to keep them at Greenstown and those other ports.

The CHAIRMAN. And the best policy of cooperation did not demand that they be scattered?

Capt. PRATT. I think it was best to keep them together.

The CHAIRMAN. You have stated that because we furnished only one-seventeenth of the antisubmarine craft operating in European waters, our influence in downing the submarine and in shortening the war was very inconsiderable?

Capt. PRATT. Did I say inconsiderable?

The CHAIRMAN. Very inconsiderable in proportion to what the Germans did.

Capt. PRATT. Well, our forces were inconsiderable in comparison with theirs.

The CHAIRMAN. But you think that our coming in had a very considerable effect on it, do you?

Capt. PRATT. No, sir; our entering the war had considerably more effect—

The CHAIRMAN. I mean on the submarine situation.

Capt. PRATT. Oh, it had more effect than an actual comparison of figures would show. It had a very appreciable material effect and is one of the contributing causes toward helping to down the submarine. Our destroyers, ship for ship, were in better shape, I think, than the British.

The CHAIRMAN. You think that the mere size of the reinforcement always determines its influence?

Capt. PRATT. No, sir; I do not think it does.

The CHAIRMAN. Do you not think, for instance, if you had two football teams that were practically even in strength, and one team was given an extra man, it would make a difference?

Capt. PRATT. It makes a great deal of difference.

The CHAIRMAN. Do you not think that would make a great deal of difference—much more than one-twelfth?

Capt. PRATT. Of course, it would; and I will tell you the reason why I drew that just exactly as I did. It was because Admiral Sims in his original paper had laid so much stress on all the types that we could have put in—submarines and yachts and all antisubmarine craft. So I treated the matter very much in the same manner as he treated it.

The CHAIRMAN. Do you not think that if we could have thrown all our destroyers and gunboats and antisubmarine craft that were available, or that might be available if they had been thoroughly repaired, in April, 1917, at the critical time, into the war over there, it would have contributed greatly to the moral effect?

Capt. PRATT. The moral effect?

The CHAIRMAN. Toward the ending of the war?

Capt. PRATT. The moral effect, I agree with you, would have been a stronger factor than possibly the material increase.

The CHAIRMAN. And the moral effect is to be reckoned with, is it not?

Capt. PRATT. It is one of the strongest things you have with in war.

The CHAIRMAN. Were all of the 1,700 British and allied antisubmarine craft employed in British waters and main line in France?

Capt. PRATT. No, sir; they were scattered.

The CHAIRMAN. Throughout the Mediterranean, some of them, were they not?

Capt. PRATT. Throughout the Mediterranean; yes.

The CHAIRMAN. Something over 900 of them were along the British coast and in France, and 700 and some odd were in Mediterranean waters; so that if we had contributed these 100 antisubmarine vessels they would have been much more than one-seventeenth of the force that was around in British waters, operating in British waters and along the coast of France?

Capt. PRATT. Oh, yes; I only handled the subject that way because Admiral Sims handled it with us that way. He totaled up antisubmarine craft. A fairer comparison, of course, is destroyers against destroyers, because, after all, I believe the destroyer is the only real antisubmarine fighter. The experience of the war did not lead us to any particular confidence in the other types.

The CHAIRMAN. So that, destroyer against destroyer, in that particular zone, which was the zone of greatest importance to us, we had what proportion of the allied destroyer strength in that zone?

Capt. PRATT. I will have to do a little figuring on that.

The CHAIRMAN. It was a very large proportion, was it not?

Capt. PRATT. We had 51 destroyers, and they had a great many; over 300 or 400, I should think. I could give the exact number.

The CHAIRMAN. Three hundred or 400 operating in that zone?

Capt. PRATT. In British and French waters, I should think.

The CHAIRMAN. Not counting destroyers that were with the Grand Fleet?

Capt. PRATT. Oh, yes; I count those.

The CHAIRMAN. But they were adequately engaged on other duty. I am talking about destroyers that were engaged against the submarines.

Capt. PRATT. I think it is fair to consider all the figures.

The CHAIRMAN. So that you would say that our contribution toward the downing of the submarines in the Atlantic was greater than 1/17?

Capt. PRATT. Oh, yes. I have made a few figures with regard to that, Mr. Chairman, roughly, and calculating what the efforts would be, at the ratios of destroyers, and destroyers alone.

The CHAIRMAN. Will you give them?

Capt. PRATT. Yes, sir. If we were to throw over 51 destroyers, the ratio of those 51 to the total French and British destroyers operating in the North Sea and the Atlantic in antisubmarine work alone, and exclusive of those with the Grand Fleet, the ratio would be about as 1 is to 4½.

If we included in this calculation the destroyers in the British Grand Fleet, that is, comparing totals with totals, it would be about as 1 is to 6.8.

Now, if out of those 51 we had to deduct the 9 which we were more or less obligated to keep to use in convoying our troopships, and had neglected screening our fleet at all, the ratios then would be about as 1 is to 6, or as 1 is to 8½; so that, comparing destroyers alone, the ratio is considerably less than 1 to 17.

The CHAIRMAN. And the destroyers are the most efficient vessels!

Capt. PRATT. By all means. Consider them the only real antisubmarine fighters.

The CHAIRMAN. Were only nine of our destroyers used to help protect our troops in going over?

Capt. PRATT. Only nine. As a matter of fact, the numbers that we had available were less than nine of the 750-ton craft. We used to use, as far as we could to piece out with, the 400-ton vessels on his side.

The CHAIRMAN. What other vessels did we use for the protection of the troops?

Capt. PRATT. We used the destroyers and our own submarines. We used to put our own submarines in convoy and let them tag on astern out of sight of the convoy, and we used them and the destroyers that we had.

The CHAIRMAN. And our battleships or cruisers?

Capt. PRATT. Oh, the cruisers were as a raider guard. But they, of course, were not really protection against the submarine. I was speaking more of the antisubmarine arm. That is all we gave them.

The CHAIRMAN. But our naval vessels that were used for the protection of troops consisted of these nine or less destroyers and a few submarines?

Capt. PRATT. And our cruisers.

The CHAIRMAN. And our cruisers. How many cruisers did we use for that?

Capt. PRATT. We used all of the *Denver* type and all of the armored cruisers.

The CHAIRMAN. But they were not particularly valuable as against submarines?

Capt. PRATT. Not valuable at all against submarines.

The CHAIRMAN. And yet you say that was the major job that was done by the Navy during the war?

Capt. PRATT. Yes, I can not help thinking so. You see, there is a difference between the convoy and the escort. When I say the major job, I refer to the chaps who handled our transports themselves, and went through the submarine zone day after day. They did not stop short of it. Our escort from this side stopped short of it, but the chaps with the convoy went through the submarine zone.

The CHAIRMAN. Armed guards?

Capt. PRATT. Not armed guards. On those ships, they were fully manned naval ships.

The CHAIRMAN. Fully manned naval ships?

Capt. PRATT. Fully manned naval ships. They consisted of the German liners that we took over, the *Leviathan* (the old *Vaterland*), and the *Mount Vernon*. They were manned from top to bottom with strict naval crews.

The CHAIRMAN. Were they frequently attacked?

Capt. PRATT. I do not know how frequently. The *Mount Vernon* was torpedoed.

The CHAIRMAN. On the return trip, however?

Capt. PRATT. Yes, on the return trip. Of course they would have preferred to take them on the trip over, because that would mean a loss of troops as well as the ship.

The CHAIRMAN. We lost none on the trip over?

Capt. PRATT. No, we lost none on the trip over. They were very well protected.

The CHAIRMAN. And that was a great record, of course.

NAVAL INVESTIGATION.

TUESDAY, APRIL 27, 1920.

**UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.**

The subcommittee met, pursuant to adjournment, at 10 o'clock a.m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, and Trammell.

TESTIMONY OF CAPT. W. V. PRATT—Resumed.

The CHAIRMAN. The committee will come to order. Have you any questions to ask, Senator Ball?

Senator BALL. No.

Senator KEYES. I have none.

Senator TRAMMELL. Captain, there were some questions asked here yesterday in regard to rumors—unfavorable rumors, I judged—in regard to the Secretary of the Navy. I believe you stated that so far as your relations were concerned with the Secretary of the Navy, they were pleasant and agreeable. Now, as far as any facts that you had in your mind are concerned, did you give any particular importance to any of those rumors that you might have heard, so far as any facts that you knew of yourself personally?

Capt. PRATT. I think I can best answer that question by telling you exactly what I told the Secretary of the Navy. I said to him, "Mr. Daniels, I came into this office without knowing you, and you did not know me. You held a post. I regarded the post and not the man. As I have often told my chief, my loyalty is to the cause and not the man, and so long as he stands for the cause I am loyal to him."

I had no personal relations at all with the Secretary of the Navy until I acted as the relief of Admiral Benson when he went abroad, and my relations were entirely of an official character. When I put anything before him I presented it in a manner which possibly he signed it; that is as far as it goes.

As far as rumors are concerned, it has been my policy to cut them out. I do not listen to them.

Senator TRAMMELL. I think that is ordinarily a very wise policy. Is it not?

Capt. PRATT. I think it is the best thing for us all to do.

Senator TRAMMELL. Rumors do not amount to much, and more frequently they are falsehoods than they are truths. I did not attach any special importance to that. I have had men write

letters jumping on me in the newspapers, and they would not even sign their names; and yet that would be the basis for a rumor, perhaps; and then when you would answer it and challenge the fellow to come out in the open with his name, he would not do it.

You were asked some questions in regard to Admiral Sims's letter and I take it from the nature of the questions that they wanted to carry with them the idea that Admiral Sims's letter was entirely a criticism of the Secretary of the Navy and not of the Navy, drawing a distinction between the two. Did you so construe his letter?

Capt. PRATT. I must answer that exactly as I told my late chief, Admiral Benson; I accept the statement at its face value. I am not a partisan of Admiral Sims or of Admiral Benson or of the Secretary or of anyone. Admiral Sims said that letter meant a certain thing. On the face of it, of course it is a criticism; but I accept Admiral Sims's intent as he said it, as I would accept any other person's.

Senator TRAMMELL. When you consider the organization of the Navy Department and the procedure there in transacting the business of the department and of the Navy, does not his letter, if it is a criticism at all, reach further than the Secretary of the Navy?

Capt. PRATT. Of course, such a thing might be, and an officer's language might be construed to reach further. I can not say what was in Admiral Sims's mind, and his intent. I think he sometimes is very impulsive—I know he is from my experience with him—and I think it was exceedingly impulsive of him to say that we were responsible for the loss of ships. What was in his mind when he wrote that letter I can not say.

Senator TRAMMELL. The reason I am asking you questions about that is that you were queried upon the same subject yesterday by the chairman of the committee. If Admiral Sims centered out the Secretary of the Navy and attempted to point out that he had been guilty of various and sundry mistakes, and intended to relieve all of the department heads and all of the Navy officers from any criticism whatever, what do you suppose prompted him and actuated him, if he was laboring in the interest of the service, in not pointing out mistakes of Navy officers as well as of the Secretary of the Navy?

Capt. PRATT. I really think that the letter, as I think I stated in my testimony, was a drive directly at the office of Operations, of which Admiral Sims was a part. It seemed to me in reading his letter over that I found more the intent to criticize the office of Operations than the Secretary. I construed the letter, myself, as being a pretty general criticism. I do not think it was restricted to the Secretary of the Navy in particular, so far as I am concerned.

Senator TRAMMELL. The reason I am asking these questions, though, is that it looks a little as though some had construed the letter to be more a criticism of the Secretary of the Navy. If the Secretary of the Navy is responsible and answerable for all mistakes, and he is the one that the criticism is directed at in particular, would not the spirit of fairness give him the credit for all of the achievements of the Navy?

Capt. PRATT. Yes; that is fair.

Senator TRAMMELL. I say, if that is true.

Capt. PRATT. Yes; that is fair.

Senator TRAMMELL. A spirit of fairness would give him the credit, if there were any accomplishments, if you are going to condemn him for all alleged mistakes. Of course, I do not entertain that idea. I

think that all of the Navy officers and heads of departments, etc., rendered a good service, and I think that the Secretary of the Navy rendered a good service. That is my view about it, from what we have heard before this committee.

You were asked the question whether the Secretary of the Navy, a civilian, was capable of preparing war plans--plans for naval battles. As a matter of fact, as far as any plans that might have been prepared, if they were prepared, do you know whether the Secretary of the Navy attempted to take the initiative in that, or did he leave the initiative to the naval officers in preparing and suggesting plans?

Capt. PRATT. I think that he expects the General Board to prepare plans.

Senator TRAMMELL. As a matter of fact, does not the record here disclose that he called upon the General Board to prepare plans, in a particular instance, at least?

Capt. PRATT. That is what they are there for.

The CHAIRMAN. February 17, was it not?

Capt. PRATT. I do not recall the date, quite.

Admiral McKEAN. The letter was February 4. The report was February 17.

Senator TRAMMELL. That is one particular instance. I do not mean that that is the only instance in which he might have called upon them, but that has been made specific mention of, indicating that the Secretary of the Navy was not attempting to assume that he would make out all of the technical military plans of operation, and so on.

Capt. PRATT. Why, of course not. I do not believe anybody expects the Secretary to make out detailed plans.

Senator TRAMMELL. You take it in your planning section. Did the Secretary of the Navy attempt to act in the rôle of the initiative power in connection with the plans, and all, that were projected through your planning section?

Capt. PRATT. No, sir.

Senator TRAMMELL. He did not?

Capt. PRATT. He did not take any such steps. Those details could be rather out of his province. He would expect the planning section to attend to that.

Senator TRAMMELL. On the question of any lack of personnel, any existed at the outbreak of the war. I do not believe you stated to whom the responsibility was with, in regard to that; I mean, in regard to the facts in connection with it. Of course, technically speaking, I believe you stated that the Secretary of the Navy was responsible, but you did not attempt to state that the facts would indicate that he had not made an effort to increase the personnel.

Capt. PRATT. I do not know what attempts he made or did not make. That is none of my province. As the system of organization stands, we have not any actual military head who is responsible. The responsibility, in a degree, rests upon the Secretary, because he is the head. He is the head of a tremendous establishment. As a naval man, I consider that a man who wrongly criticizes him shares that responsibility, but you have got to get down to a more definite basis than that. The Secretary, no matter how wise a man he may be in his own particular affairs, must

SENATOR TRAMMELL. In dealing with the question the General Board makes recommendation, or it is the chief of the Bureau of Navigation makes recommendation seems that in 1915 the General Board suggested an increase in the personnel. This recommendation was considered by the Bureau of Navigation and the chief of the Bureau of Navigation stated that they had sufficient men and perhaps had a surplus, I think, of some 300 men. Now, the Secretary of the Navy might have accepted a report of the Bureau of Navigation and the views of the Bureau of Navigation division under which personnel came directly, would that that was a question of the Secretary of the Navy consulting with the naval officers, and not giving consideration to naval officers?

Capt. PRATT. Of course he did. That is just what he accepted the advice of Rear Admiral Blue, and another man who thought very much on the subject thought that was dead wrong.

SENATOR TRAMMELL. Now Admiral Sims or anybody else criticizes the question, certainly criticizes naval officers, criticizes the Secretary of the Navy, does he not?

Capt. PRATT. Of course he does, or should. He is responsible for the advice he gave, and he ought to be.

SENATOR TRAMMELL. Then in 1916 Rear Admiral Sims of the Bureau of Navigation, and he recommended an increase in personnel, and the Secretary of the Navy might have accepted him, possibly, two or three or four thousand; but he did not accept him, he cooperated with him in going before the committee, and got a very large increase in the personnel in 1916. Did they because they might have differed to the extent of 3,000 men? They agreed in the main, that the Secretary of the Navy

moniously, in the main, with the naval officers who were experts in their particular line, and were capable of giving technical literary advice? That is what I want to find out, as a matter of fact. Of course I think that he could do that in the main; that is my view. But I want to find out whether he did or he did not. There seems to be the opinion of some that he did not give any consideration, practically at all, or very little, to the Navy officers. Capt. PRATT. Naturally, I can not say what he did with Admiral Sims or Admiral Blue, or even my own chief, on personnel. I know that when I had a business proposition to put to him I got an answer.

Senator TRAMMELL. That is a matter of record, this matter I am discussing now, of personnel.

Capt. PRATT. Yes.

Senator TRAMMELL. It has been testified to here before this committee, and in the main I have been impressed with the fact that he is trying to cooperate with the Navy officers in the matter of rearing and building up the personnel of the Navy, beginning back 1915 and 1916. Of course, if he was not doing it, I would like to know, but that is the impression I have gotten—that he was doing it.

Capt. PRATT. I had no trouble with him.

Senator TRAMMELL. You testified more or less in regard to the attitude that was given to Admiral Sims, and the spirit of cooperation that you witnessed in regard to carrying on the operations with him. In your official connection there, did you know of any specific acts or any consequence where the Secretary of the Navy was attempting, you might say, interfere with his jurisdiction or his discretion in regard to matters that came under his command abroad?

Capt. PRATT. No, sir; not after I came in the office in an executive capacity, June 25, 1917; I do not recall any specific instances now. Before that date, I should prefer to have Admiral Benson speak of it.

Senator TRAMMELL. As far as your knowledge, then, Admiral Sims was given such latitude and such authority as seemed to be necessary and proper in the position which he was occupying, was that not?

Capt. PRATT. Yes; in general, I think so.

Senator TRAMMELL. That was the impression I got from your testimony. I believe that in your direct testimony you disagreed with Admiral Sims that practically all of the operations should have been handled from London, did you not?

Capt. PRATT. If that was the intent of his letter.

Senator TRAMMELL. Yes.

Capt. PRATT. I must disagree. They could not have been handled in London entirely. Operations at the front must be handled in London, but there are a great many other operations which have to be handled and directed from the rear.

Senator TRAMMELL. The operations at the front were handled in London, were they not?

Capt. PRATT. In the main, yes. I think in certain minor instances may have interfered with him in the details of ships; but I do not regard those interferences, if such existed, to have been material. They might have been vexatious, but they were not material.

Senator TRAMMELL. Those interferences were largely caused on account of the officials here being more familiar with the question of the availability of ships, and probably having a more general knowledge of the entire situation than he had in London, were they not?

Capt. PRATT. Some of them may have been, but I think in one or two instances we issued direct orders to ships that were over there, when it would have been wiser to have turned them over to him bodily and said to him, "Order them where you please." Those, however, are mistakes that are liable to happen under all conditions. I do not think they were very material.

Senator TRAMMELL. Those are mistakes that are liable to happen; just like Admiral Sims might occasionally have made a mistake in requesting something or requesting you people on this side to do something that you could not do or that you did not think it was advisable to do on account of probably having a more general knowledge of the entire situation than he had, are they not?

Capt. PRATT. Oh, of course those things are liable to happen, yes.

Senator TRAMMELL. As a matter of fact, I suppose little differences like that always arise in connection with the operations of war.

Capt. PRATT. It would be impossible to avoid them, I dare say.

Senator TRAMMELL. Those little mistakes or differences within themselves do not indicate any lack of intensity of a desire to proceed and accomplish results, do they? Nor do they indicate any lack of a general spirit to cooperate and harmonize, do they?

Capt. PRATT. No.

Senator TRAMMELL. Because your particular branch of the service might have disagreed sometimes on matters of no such great importance, with Admiral Sims, did you construe that to mean that you were out of harmony, and that you were not trying to cooperate to the general end?

Capt. PRATT. Oh, no; I thought we were cooperating very successfully.

Senator TRAMMELL. I remember, in regard to one or two orders here, Admiral Sims said that the man who issued that order must never have seen the sea, and must never have been on a boat. If that order was issued at the suggestion of a naval officer, would not that kind of a criticism reach the naval officers as well as the Secretary of the Navy?

Capt. PRATT. Why, of course it does; but whoever the naval officer was that that hit, he would regard that as one of Sims's hyperboles of speech.

Senator TRAMMELL. I am not after arousing antagonisms. I do not want to do that. But I want to show that Admiral Sims can not pick out the Secretary of the Navy and try to bombard him, without hitting a good many naval officers.

Capt. PRATT. Oh, no; sir. I think Sims hit me in that, and I rather regarded it as a joke. He and I never had any quarrels over that.

Senator TRAMMELL. I do not think I have any further questions.

The CHAIRMAN. Captain, was not Admiral Sims's letter principally a criticism of the policies that were followed out by the department in relation to his recommendations?

Capt. PRATT. I think it was.

The CHAIRMAN. And in each case did not those policies have to be finally determined by the Secretary of the Navy?

Capt. PRATT. Yes.

Senator BALL. Subject to his approval?

Capt. PRATT. Subject to his approval; yes, sir.

The CHAIRMAN. Therefore he had the final say about the determination of the policy?

Capt. PRATT. Oh, he must, as the head. I feel, though, that his naval advisers must share in any degree of criticism, if such criticism exists.

The CHAIRMAN. That may well be; but if the purpose of the letter was criticism so that improvement could be made in the future, would it not be the best policy to follow to criticise the one who had the final determination? As far as the individual acts of officers of the Navy may be concerned, what they had done was over, and there was no particular advantage one way or the other in blaming or not blaming these men. If, as I interpret it, the letter was constructed and was written for the purpose of improving matters in the Navy, what we would want to get at would be the cause of the failures, and not the individual acts of officers of the Navy. I think I am right, am I not?

Capt. PRATT. Absolutely; that is what would be wanted; and the simplest and plainest exposition I believe is the best. A straight, honest way is always the best, no matter how direct it is.

The CHAIRMAN. And if the system proved faulty, and if a Secretary, under the then existing system, could tangle things up, would it not be well to revise the system.

Capt. PRATT. I think it would be right to revise the system.

The CHAIRMAN. And a letter that was written so as to improve matters in that respect would be a perfectly proper letter, would it not?

Capt. PRATT. Without doubt.

The CHAIRMAN. Senator Trammell asked you whether the Secretary had written to the Planning Section asking to have a plan made, and you referred to one letter from him dated February 10, I believe.

Capt. PRATT. I do not know whether the Secretary originated that letter or not.

The CHAIRMAN. Was that a letter to the Planning Section of Operations or to the General Board?

Capt. PRATT. No, sir, I refer to —

The CHAIRMAN. Was to the General Board?

Capt. PRATT (continuing). The letter of February 10 was prepared by Capt. Chase, was signed by the Secretary, and was to the General Board.

The CHAIRMAN. Oh, then that was the letter the answer to which was lost?

Capt. PRATT. That is the letter the answer to which was lost.

The CHAIRMAN. So that it is not very material. If he did write such a letter to the General Board, apparently there was nothing done about it?

Capt. PRATT. They submitted an answer which has disappeared.

The CHAIRMAN. Then it was not used?

Capt. PRATT. Oh, no. I did not use it, and I do not know of any other persons who did.

The CHAIRMAN. Do you recall any other instances where the Secretary wrote to the General Board or to the Planning Section asking for specific plans?

Capt. PRATT. No, sir, he never wrote to the Planning Section that I know of; but I would not know.

The CHAIRMAN. You do not know whether he wrote to the General Board?

Capt. PRATT. I would not know that.

The CHAIRMAN. When Admiral Blue made up his list in 1914, showing, as he claimed, that the Navy had already had more men than it needed, do you know anything about that list?

Capt. PRATT. No, I do not know the details of that. I only know in a general way that it was an attempt to run our ships in full commission with less men than most naval officers believed to be the full complement quota. I believe they created a complement which was called the peace complement, which was supposed to work in peace, but it was not a war complement.

The CHAIRMAN. Are there not at all times in the naval personnel a large number of men who are not available?

Capt. PRATT. You mean on account of the specific duties they are performing?

The CHAIRMAN. No; because of sickness or otherwise?

Capt. PRATT. Oh, yes; sick men.

The CHAIRMAN. And others; running up to quite a large percentage at all times.

Capt. PRATT. Well, in personnel as in material there must always be a factor of safety to provide for casualties, sick men, etc.

The CHAIRMAN. Were not these sick men used in making up that list of Admiral Blue and other unavailables?

Capt. PRATT. I do not know, sir. Admiral McKean may know about that.

The CHAIRMAN. You have no further knowledge about that?

Capt. PRATT. No, sir.

Senator TRAMMELL. Now, in regard to this letter, whether or not it was the best policy to direct the entire criticism at the head of the Navy, as a matter of fact did the criticism as made apply only to the Secretary of the Navy?

Capt. PRATT. You mean his letter of January 7?

Senator TRAMMELL. Yes; that particular letter and its application.

Capt. PRATT. I did not take it quite that way. In my direct testimony, on page 4, I made the statement:

Admiral Sims has presented his evidence against the department, and particularly against the Office of Operations, with a great array of facts.

Being in the Office of Operations, I naturally assumed that we were coming in for a full share of that, as we should if we had done anything wrong.

Senator TRAMMELL. Admiral Sims has taken the position that the Navy officers were much more competent to do the planning and to prepare, you might say, the military programs, and so on; and if that is true, and the men of the Navy that were called to these different positions of responsibility largely did make out the plans and direct matters, even though they might have done it under the Secretary of the Navy, and it had to have his final approval, would they not share in the responsibility for what was done?

Capt. PRATT. Why, sir, there is not a naval officer who is worth his salt who want to duck one bit of responsibility.

Senator TRAMMELL. If the Chief of Operations, for instance, with his corps of able assistants, prepares a plan and takes it to the Secretary of the Navy, who is not a trained naval man, and not technical, and he gives that his approval, and somebody comes along and criticizes it or alleges that it was a mistake, who is, you might say, the more responsible for the plan of the two, the naval officer or the Secretary of the Navy?

Capt. PRATT. Why, sir, as I said before, every naval officer is anxious to assume all the responsibility that he can, and even a little more, sometimes. Every naval officer who is worth his salt has got to assume responsibility, and wants to. That is our life. We can not go out and fight battles unless we have that spirit and are willing to do it.

Senator TRAMMELL. I am not trying to place any criticism.

Capt. PRATT. No; I know you are not.

Senator TRAMMELL. Because I have not any criticism to make, myself.

Capt. PRATT. But I am trying to tell you how we feel about it.

Senator TRAMMELL. There seems to be a disposition to want to place a great deal of criticism on the Secretary of the Navy in particular, but I have no disposition of the kind. I dare say, if we turned the searchlight onto the record of Admiral Sims, while in the main he rendered good service, I think we might find where Admiral Sims probably changed front or maybe made some mistakes, which could be perfectly natural; but I rather measure a man's service in the broader sense, not picking out some little technical mistake he might have made, and criticising it; so that I do not mean it as any criticism of naval officers at all; and I also realize he was in better position to give technical, expert advice than a civilian would be; naturally so. But if they are in that position, and the Secretary of the Navy follows their recommendation in the main and in a general way, I do not think that the Secretary is entirely the party to blame if the mistakes were made. That is my position in regard to that. I think that is all.

The CHAIRMAN. I suppose, Capt. Pratt, that if Admiral Sims had asked for six destroyers and had written the Secretary of the Navy to that effect and the Secretary of the Navy had turned the matter over to operations to decide upon it whether he should have the six destroyers or not, and operations should decide that he should have the six destroyers, the matter would then go to the Secretary of the Navy for his approval, would it not?

Capt. PRATT. Yes; when we started in this war, matters of detail had to be arranged through the Secretary, that way; but later we used to handle operations a little more directly. The Secretary could not attend to all such matters of detail; it would be impossible. So I think in many cases we acted directly, after the policy was once established.

The CHAIRMAN. You mean that a cable would be received by you directly, before it would go to the Secretary?

Capt. PRATT. Well, if Admiral Sims made a specific request, say for a particular ship or so, I would take an answer approving it to my chief, Admiral Benson. If he approved it, it would be issued.

The CHAIRMAN. Without going to the Secretary?

Capt. PRATT. I think, in many cases, that is true.

The CHAIRMAN. But in a case of sending over a large number of destroyers or sending over destroyers for the first time, the Secretary would have to approve it?

Capt. PRATT. He would have to approve of the general policy.

The CHAIRMAN. Then, after he had approved the policy, if Operations unduly delayed the sending over of those ships, then the fault would be with Operations, would it not, and not with the Secretary?

Capt. PRATT. Quite so.

The CHAIRMAN. But if, on the other hand, when the question was put up to the Secretary, he delayed action on it, pigeonholed it and kept it waiting for some time before making the decision, the responsibility would then be to him?

Capt. PRATT. Necessarily so.

Senator BALL. All general policies had to be approved by the Secretary?

Capt. PRATT. They must be. He is the head of things.

Senator BALL. Those demands made by Admiral Sims for increases in personnel and ships, and so forth, had to be approved—that general operation plan had to be approved—by the Secretary?

The CHAIRMAN. They were all questions of policy?

Capt. PRATT. Naturally so. He must approve all general policies.

The CHAIRMAN. That is all.

Senator BALL. That is all.

The CHAIRMAN. That will be all, Capt. Pratt, and you will be excused.

Capt. PRATT. Aye, aye, sir.

TESTIMONY OF REAR ADMIRAL JOSIAH S. McKEAN, UNITED STATES NAVY.

(The witness was sworn by the chairman.)

The CHAIRMAN. Admiral McKean, have you a statement to make about matters pertaining to this investigation?

Admiral McKEAN. Yes; I have a statement, and I will submit from time to time in different sections the official documents, copied from the records of the Navy Department, to illustrate and substantiate the contentions; and I have here several complete copies of these documents.

Following the procedure that has heretofore been followed by the committee, I have prepared a memorandum showing what duty I was doing from time to time from the outbreak of the world war in 1914 [reading]:

MEMORANDUM.

MARCH 30, 1920

Service from beginning of the World War to date:

From August, 1914, to December 26, 1914, commanding U. S. S. *West Virginia*, Pacific Fleet.

From January 5, 1915, to July 1, 1915, Commanding U. S. S. *North Dakota*, North Atlantic Fleet.

From July 1, 1915, to February 15, 1918, assistant for material in the Office of Chief of Naval Operations, Navy Department, Washington, D. C.

From February 15, 1918, to September 15, 1918, commanding U. S. S. *Arizona*, North Atlantic Fleet.

From September 15, 1918, to January 5, 1919, assistant for material, Office of Chief of Naval operations, Navy Department, Washington, D. C.

From January 5, 1919, to June 21, 1919, Assistant Chief of Naval Operations and Acting Chief of Naval Operations during absence of Admiral Benson in Europe.

From June 21, 1919, to September 25, 1919, date of Admiral Benson's retirement, Assistant Chief of Naval Operations.

From September 25, 1919, to November 8, 1919, Acting Chief of Naval Operations.

From November 8, 1919, to date, commanding Battleship Division 6, Pacific Fleet.

The absence of Admiral Benson continued up to June 21, 1919. Upon his return, and up to the date of his retirement, I was dropped back to my normal job of Assistant Chief of Naval Operations. When on Admiral Benson's retirement, when Admiral Coontz became Chief of Operations, I was again acting chief.

Since November 8, 1919, I have been in command of Battleship Division 6, Pacific Fleet.

The CHAIRMAN. Where was the *Arizona* stationed?

Admiral McKEAN. It was in the North Atlantic Fleet, mostly based in Yorktown. In the early stages of my sea tour we went to sea several times, and after that we limited our activities to the bay, and then just before I was detached, I took her to the navy yard, New York.

The CHAIRMAN. She did not get across the water?

Admiral McKEAN. She did not, with me. I was fortunate enough to be able to arrange that after I got in the department.

From a study of the original letter on which this investigation is based, and from listening to the testimony given by various witnesses, we have arrived at the conclusion that this whole controversy can be reduced to two main issues.

First, neglect of preparation before the United States went into the war; and, second, not putting the whole or not concentrating the whole efforts of the Navy Department and the fleet, ships, officers, and men on the antisubmarine menace in European waters, on April 6, 1917, on the declaration of war.

As to the first charge, neglect of preparation before the United States went into the war, this may be divided under three heads:

(a) That there were no plans.

(b) That the personnel was not ready.

(c) That the material was not ready.

The first requirement in war plan making is trained plan makers. That this was appreciated by the Secretary of the Navy the following incident will show. In late May or early June, 1913, shortly after the present secretary came into office, he visited the Naval War College, Newport, R. I., and at a dinner he was, at his own request, literally swamped with advice in reference to his duties and opportunities by all the officers present, among them Capt. W. S. Sims and myself, both at the time students at the college, and we contributed at least our share.

After a long session at the table, we adjourned to the drawing room, and thus the Secretary had his first opportunity to face the whole of his numerous advisers; whereupon he said in substance: "Gentlemen, you have given me a great quantity of valuable advice, which will take me a long time to digest. I have no doubt it is all good, but it is like a great deal of the advice given me by my official aides in Washington. It is not sufficiently concrete to put into immediate use. What I wish you would tell me is ~~the~~ the first and most important single act, which I can perform to ~~the~~ the Navy." Captain, now Rear Admiral Sims, immediately said: "What you want to do, Mr. Secretary, is to appoint a board of inquiry to immediately inter-

rupted Sims, with apologies, I hope, saying, "Pardon, me, Mr. Secretary, you do not want to appoint a board. The Navy Department cellars are full of boards' reports never acted upon. As I understand it, you wish to know now what single executive act of yours will do the most good to the Navy. My recommendation is that you send a wire to the aide for operations, informing him that hereafter he, the aide for operations, will be your sole military adviser and that his duties will be to coordinate the activities of the other aides, for personnel, material, and inspections, in the same way that they coordinate the activities of the various bureaus and divisions under each of them."

This recommendation met the approval of the officers present but the Secretary demurred; said he could not do that without great consideration, as he feared he would be giving up too much of his authority and avoiding what should be his responsibilities. After some discussion in an attempt to show the Secretary that he was not giving up any authority and that he could not possibly avoid his responsibilities, this recommendation was passed over and he asked what next we had to offer. In reply it was suggested by myself, or some other officer, that he send an order to the Bureau of Navigation directing that at all times thereafter, they were to have two classes, of not less than 20 officers each at the War College under training at all times. He agreed to this and since that time except during the war this condition has been maintained, and thus for the first time in the history of our Navy, we are providing for the training of something like an adequate number of officers for the duty of making war plans.

The second step in plan making is to collect the necessary information on which to base plans. This is the duty of the Office of Naval Intelligence, a division of the Office of Operations.

Once again, we have never had sufficient personnel to have an adequate staff of officers abroad collecting information, and of the small number we have had, few of them were selected solely because of their superior training for the job.

The War College must provide these trained officers in addition to the plan makers.

The third element in plan making is that there must be some head to the plan-making body. This head was provided under law March 3, 1915, establishing the office of Chief of Naval Operations [reading]:

There shall be a Chief of Naval Operations, who shall be an officer on the active list of the Navy appointed by the President, by and with the advice and consent of the Senate, from among the officers of the line of the Navy not below the grade of captain for a period of four years, who shall, under the direction of the Secretary of the Navy be charged with the operations of the fleet and with the preparation and readiness of plans for its use in war: *Provided*, That if an officer of the grade of captain be appointed Chief of Naval Operations, he shall have the rank, title, and emoluments of a rear admiral while holding that position.

During the temporary absence of the Secretary and the Assistant Secretary of the Navy, the Chief of Naval Operations shall be next in succession to act as Secretary of the Navy.

As will be seen from this law, the Chief of Naval Operations was given two duties:

(a) He was charged with the operations of the fleet and (b) with the preparation and readiness of plans for its use in war, which, per-

other way, would be that he was responsible, first, for the preparation of plans; second, for the preparation of the fleet to carry out plans; and, third, the execution of the plans.

An essential step was, I believe, made law under the urgency of war. Richmond P. Hobson, Member of Congress from Alabama, made law, while absolutely essential and filling a long-felt want in the Department organization, did not fully meet the situation. The law defines the responsibilities of the Chief of Naval Operations, but does not confer adequate authority on him to meet his responsibilities.

It is, to come to the statement that there were no plans. There were general plans made by the general board as to the composition of the peace or A fleet, also of the war or C fleet. There was an intermediate plan, B. These gave the vessels to be used under the two conditions.

These general plans were first submitted in 1913, were brought up to date in 1915, and, with the World War going on and our entrance into it probable, were again revised in February, 1917.

These were the general basic plans with which we worked and, taken together, the base plan and the mobilization plan, were sufficient for the guidance of all concerned at the dates they were issued.

There were not detailed complete paper plans for the meeting of all possible conditions because the trained personnel to work out such detailed plans was not available, nor was the information. The general Board's plans were of necessity general plans, and it was necessary to add to and modify these by detailed plans for different conditions from time to time.

In this connection I would like to say that there has been a good deal of discussion by different witnesses about complete detailed plans.

That is pure theory. As Capt. Pratt showed, that is all right for an aggressive nation that is planning to take its neighbor's territory or to operate at the expense of somebody. They have got a definite objective. They have got a definite idea in their heads. They organize definitely for that purpose. They can work out to the minutest detail on the gaiters, as somebody said, the army and navy, and supplies, munitions, and the whole business. They can put it in infinite detail, and sublet from one planning section to the next and to the next, and it goes into detail until all the "i's" are dotted and all the "t's" are crossed. Von Moltke is the man of that, in the Franco-Prussian war, and that is the plan that these people are talking about. Von Moltke had such a plan, I believe. He worked it out very successfully, as we know.

His successor in 1914 undoubtedly had a plan similar to that. He tried to work it out. The Belgians delayed him two weeks; the Battle of the Marne turned him back; and his plans were gone; they were too far in advance; they had been projected too far in advance and in too much detail, and when they broke down, when one part of the detailed plan broke down, the machine went to pieces.

CHAIRMAN. Is it not possible to have a detailed plan of defense as well as of aggression?

Admiral McKEAN. Yes; that is the first thing you should prepare for defense, before you launch the offensive.

We have built up a Planning Division in Operations to work out these detailed plans as soon as the officer selected for the head of this divi-

sion, Capt. F. H. Schofield, came back from sea and was available. We added personnel as it became available from time to time until we had a very efficient but small Planning Division, and even this we were finally compelled to transfer bodily to the London office, doing similar work for Admiral Sims.

The first break in it, or the first addition to the Planning Section, was after Capt. Schofield was with Capt. Pratt for half time—a sort of volunteer. Then we got him on full time. Then, on Chase's death, we took Pratt and put him in as assistant chief. Then we sent the rest of it over to Sims in London.

The committee's attention is here called to the fine compliments paid this Planning Division by Admiral Sims for the work they did in London. I believe they deserved all that he said of them for the work they did in London. I do not agree with Admiral Sims's estimate of the work the same men did in Washington being stupid or worse than worthless. I do not know what could have changed the mental capacity of these officers so suddenly. It has been suggested that it may have been afternoon tea or London fog. Some people thought it was Scotch mist. I do not know.

Now, as to personnel.

The CHAIRMAN. You had best keep all personalities out of it as much as possible.

Admiral McKEAN. I have not mentioned any names, and I do not think, Senator—I am not intending to go any further in personalities than I interpret the letter to be coming toward us as personal. I am not a partisan for either side. I am not an attorney for the Secretary of the Navy. I am not trying to damn Admiral Sims. I am an officer of the Navy; I worked in Operations; and this letter to me is aimed at Operations. It may have been aimed at the Secretary. The shooting was bad, and it hit Operations; and personally I feel that I am justified in defending in the same line that I was attacked.

The CHAIRMAN. However, we will have no personalities.

Admiral McKEAN. No, sir; there are no personalities. I have none.

Senator TRAMMELL. I do not think that borders on personality. I remember Admiral Sims provoked the applause of the audience on several occasions by some very snappy, witty observations, and I did not hear anybody object to that. The testimony is full of his snappy, witty expressions.

The CHAIRMAN. What we are trying to get is information here, and not snappy wit.

Senator TRAMMELL. You ought to have started on Admiral Sims. I wish you had started on Admiral Sims.

The CHAIRMAN. I do not think he criticised anybody.

Senator TRAMMELL. He said such things as that. Speaking of an order he said that the fellow that sent out that order could never have seen the sea or a ship. I think that is about as critical and personal as this.

The CHAIRMAN. If he thought that, that was a proper remark to make.

Senator TRAMMELL. The witness has a right to give his ideas here. I want them all treated alike.

The CHAIRMAN. I think everybody will have fair treatment.

Admiral McKEAN. I am not complaining, Senator.

The CHAIRMAN. Now if you will proceed, Admiral.

Admiral McKEAN. Proceeding to the matter of personnel, the next subhead was that the personnel was not ready. There is no question that we were short of both officers and men; the Navy personnel was too small for its job. The fleet had been built up serially, but neither the commissioned or enlisted personnel had kept step with the material. The officer shortage dates back, in my opinion, to the act of August 5, 1882, which law provided for honorable discharge of a large number of graduates of the classes 1881, 1882, 1883, 1884, 1885, 1886, and 1887. At the same time by the same law, through the elimination of cadet engineering appointments, the number of appointments to the Naval Academy were reduced by 25 each year. The total effect of this law in the 35 years of its operation undoubtedly reduced the number of commissioned officers available at the time we entered the World War by about 750. The shortage of officers commenced to be felt in the service about 1893. It grew progressively worse in spite of increases in appointments to the Academy from time to time. There is no doubt that we did not have more than 40 per cent of the officers needed when we entered the war, but the responsibility for this condition dates back through many years and through numerous administrations. The question of the shortage of enlisted personnel has been fully gone into. We were short; I believe the primary causes of incorrect recommendations of the then Chief of the Bureau of Navigation were due to the use of that old delusion, "Peace complements for fighting ships." Although the expression "peace complement" has been used for years in congressional hearings and by some officers of the Navy, I have never been able to understand what was meant by a "peace complement" on a fighting ship. In my mind there are only two complements. These complements being based on the condition of the ship.

(a) What we usually mean by complement, that is, full crew for fighting. This is the only complement suitable for a man-of-war in full commission.

(b) "Reserve" complement, that is, the complement of a ship in reserve. We have at various times tried varying numbers for a reserve complement. My experience as commanding officer of ships which had been in reserve and especially my experience as Assistant Surgeon Material, has most entirely and completely convinced me that the minimum complement to keep a ship in reserve so that she may on the approach of war be put in commission in time and in condition to use in the war, is 50 per cent of all lower ratings and in addition all chief petty officers, making a total reserve complement about 60 per cent of the full or fighting complement. This is the minimum necessary first to keep the ship in proper material condition, second, to properly train the reserve, militia, or other personnel which is assigned to her on going into full commission to complete her full complement. This will give each reserve or other seaman a running mate in the same duties to coach him rapidly for his job. The full complement of warrant officers should be on board. The commanding officer, executive officer, other heads of the departments should be on board. This is, in my opinion necessary so that the ship may be taken to sea from time to time to train her own complement to train her recruits and reserves, and more important, to test out her machinery, mechanical and electrical devices, and by

limited target practice and cruising to prove her actual material readiness for war.

From a conversation I had with Admiral Blue in January, 1917, I am convinced that his error in estimating the total number of ships required in the Navy were due to the fact that he took the ships listed in the General Board's plans and figured them with what he called "peace complements," about the same complement that was used by the bureaus in arranging for berthing and other accommodations for the crews when the ship is designed. This last practice should also be changed, as we know now, and have known for some time, that owing to additions made from time to time in the mechanical devices on board ship, communication systems, signalling systems, fire control, etc., that the complement of a ship necessary to train her for war and to fight her in war, always increases with every new development in the art of war at sea.

Now there was a question, to clear up the question of the chairman this morning to Capt. Pratt about the mistakes in Admiral Blue's estimate. I know that he did not make any allowance for sickness or short time or shore station, and so on. His estimate was entirely wrong. I tried to convince him of it in his own office—he asked me what I thought of his business—and I said "You are wrong;" and I tried to show him why. He defended it and I believed in it at the time, and I suppose he so advised the Secretary.

You can train and you can fight a ship with a "peace complement" or you can train with a "peace complement" and then throw a load of recruits on board and go out to fight, but you won't either train or fight anywhere near the capacity of your ship. To make it plain to a layman just what I mean, a fighting ship's crew is the largest, most complicated, and should be the highest skilled and highest trained team known to anybody. There is more real "inside ball" and more "inside dope" in the training and handling of this team of about 1,500 men and officers than can even be dreamed of by anyone who has not had a hand in training of and developing at least a part of such a team. As you gentlemen know, you could train a baseball team of seven men and play at the game, but they can't help your score if you are playing against a nine-man team of the same quality.

Third subhead under lack of preparedness is that the material was not ready. This is the particular part that I am, through association and duty as assistant for material, most familiar with and most responsible for; and at the outset I will say that the fleet was not 100 per cent ready, is not 100 per cent ready now, and that it never will be 100 per cent ready at the outbreak of war.

The navy yards were not 100 per cent ready; they are not now, although the Atlantic coast yards are much better prepared than they have ever been before. The Pacific bases are not as near ready as were the Atlantic in 1917, and for the same reason—Congress has not appropriated the money, though complete plans with estimates have been submitted. In this connection the committee's attention is called to the work done by the so-called "Helm Commission," appointed by the President in accordance with a resolution of Congress, not by the Navy Department.

I bring this in here, although it sounds extraneous; but the fleet and the yards from which the fleet operates with me is the basis

whole trouble. That is where we start wrong; and, as I believe the purpose of the committee is to correct it, I speak of this commission and its report. This commission has submitted a series of the most valuable reports to Congress and the department of which I have any knowledge. It has completely covered the coast from Hatteras down to Key West, and then along the whole of the Gulf in the Atlantic. It has also covered from San Diego to and including Puget Sound on the Pacific. It has not covered the West Indies, the Panama Canal, the Hawaiian Islands, Guam, or the Philippines. I believe that there is nothing more fundamental than the selection of proper bases, and I recommend for the consideration of the committee that the Helm Commission be continued and that it cover the remaining part of our coast and the outlying stations, so that Congress may have before it for future reference a complete systematic and scientific study of our needs in this respect. I noted in the Washington Post of April 22 that a member of your committee had returned from a trip to the West Indies with a recommendation, so the paper said, that Port au Prince should be developed as a naval base for our fleet in lieu of Guantanamo, Cuba. This recommendation may be incorrect, but of the dozen or more complete studies made by boards of officers at different times and in different connections of bases in the West Indies, of all the studies that Admiral Mahan and other writers on the strategy of the Caribbean, this is the first and only one that I ever heard even suggest that Port au Prince, Haiti, would be of any value whatever to us as a naval base.

The CHAIRMAN. Admiral, I think you are mistaken about a member of your committee having done that.

Admiral McKEAN. I am just speaking of what I saw in the Washington Post.

The CHAIRMAN. Possibly it was a member of the general Naval Committee of the Senate.

Admiral McKEAN. I do not know, sir, but I was just pointing out that I hoped somebody would be sent to study this thing, and that we would not get in wrong.

Senator BALL. The Helm Commission intends to continue its investigations.

Admiral McKEAN. I do not know, sir. It has never been dissolved, to my knowledge. It is a congressional commission, now, I understand.

Senator BALL. I know it has not been dissolved, and it expects to continue. We had them before a subcommittee of ours with reference to the Atlantic coast.

Admiral McKEAN. Yes, sir.

The CHAIRMAN. But I think you are mistaken in saying that it was a member of the Naval Affairs Committee that made such a report.

Admiral McKEAN. I do not know that the Post quoted the name, but I think it said that it was a member of the committee. That is subject to correction.

Senator KEYES. I think it ought to be made clear in the record, as your testimony would indicate that some member of this committee was referred to.

Admiral McKEAN. Your committee here?

Senator KEYES. Yes.

Admiral McKEAN. Oh, I meant the Naval Committee.

Senator KEYES. Very well.

The CHAIRMAN. I think it is a mistake.

Admiral McKEAN. I will make a note of that, and if it is incorrect, I will correct it in the revision of my testimony.

(Senator King, of Utah, was the name in the article.)

There are plenty of officers and boards who doubt the present utility of Guantanamo. There are different reports recommending numerous places such as Samana Bay, Culebra Island, Fajardo Passage, St. Thomas, etc., but this is the first I have heard of Port au Prince in this connection. This is a big subject, gentlemen, and it would take weeks of as thoroughly competent a commission as the Helm Commission to cover this ground properly, making the necessary studies and thoroughly considered recommendations. It can't be done too soon.

The industrial supplies and ship supplies on hand were not adequate when I became assistant for material, July 1, 1915, but from that date on, the shortage of these supplies was in progress of correction, and we were in much better shape on April 6, 1917, than we had been for some years previous.

Now, to show what point of view I am testifying from, I say this in explanation of my duties and point of view, it was my understanding as assistant for material, that the functions of my office were to coordinate, under the direction of the Chief of Naval Operations, the efforts of the material bureaus, the navy yards and the fleet, so as to maintain the fleet in condition to carry out the military plans of the Chief of Naval Operations for the use of the fleet in war.

Very early in my duties my investigations confirmed my previous opinions acquired with the fleet, that our shore establishments, navy yards, supply bases, etc., had not been developed as rapidly as the fleet had been built up, and that they were not capable of maintaining the fleet materially fit for war.

To meet this condition the following steps were recommended by me and approved by the Chief of Naval Operations and the Secretary of the Navy.

The CHAIRMAN. What was the date?

Capt. PRATT. I have those different things here, and they each have the date on them. They came at different dates. I started in shortly after I reached the department, July 1, 1915, and I was pretty constantly at it. For instance, here is the regular overhaul period, August 10, 1915. That is the first one of those, and I cite and will take up these policies later and explain each one of them and show when they were established and what I was trying to do in the way of general preparation.

The CHAIRMAN. Then, this is the synopsis of what is here?

Admiral McKEAN. Yes, the synopsis of what will follow here. These are the steps that were recommended by me and approved by the Chief of Naval Operations and the Secretary of the Navy:

(a) The doing away with the repair period, through which the fleet had come to depend upon the yards for too many of its repairs and was losing its capacity, so economical in peace and so essential in war, of "self-maintenance."

(b) The increase of the number of repair and mother ships capable of making large repairs, which would otherwise require the vessel's return to a navy yard.

(c) The development and equipment of the various navy yards to enable them to promptly and efficiently make such repairs as the yards themselves, assisted by the repair ships, could not make.

(d) The board of inspection and survey was directed to thoroughly inspect all vessels on the Navy list, with the purpose of:

First, determining those having no military value or so little military value as to no longer justify expenditures to maintain them, thus eliminating them from the list and using the money for useful craft; and, second, to determine the needed repairs on useful craft with estimates of cost and time; to determine the charges against appropriations and the amount of work that would be required of the navy yards.

(e) To determine to what extent the yards should be developed. The General Board, at the request of the Chief of Naval Operations, drew up a base plan adequate for a fleet such as was contemplated in the general war plans.

The CHAIRMAN. That is the base plan for the yards?

Admiral McKEAN. That is the base plan for the whole fleet. That included navy yards, fueling stations, other supply stations, and bases; everything that the fleet needed on shore to successfully operate. The principal thing was the navy yards.

(f) At my request the navy-yard development board was organized to work out detailed plans for each navy yard and shore station to enable it to meet the demands of the General Board's base plan.

In explanation of the navy yard development board, that was, although we did not call it that, really the plans section for bases. I was chairman. The assistant chiefs of bureaus were the bureau representatives, and we took the demands made by the base plan of the General Board, took the yard as it was and then tried to develop it most economically and efficiently to meet the demands made in the base plan of the General Board. That board is still functioning, and the idea fundamentally was that we would get what we needed in navy yards. The old way was that navy yards grew, just like Topsy, and depended on local favor, etc., more than on the demands of the fleet. The fleet was used to keep up the yards, instead of the yards being used to keep up the fleet, and that was not either economical or efficient.

Senator BALL. What year was this that you made these recommendations?

Admiral McKEAN. 1915, in the fall; and the navy yard development board was the spring of 1916, I think.

The CHAIRMAN. It would be much better if you would give the dates of these recommendations, so that we will not have to look them up in the papers filed.

Admiral McKEAN. I thought that I would make just a general statement, and then I will take them up in sequence.

The CHAIRMAN. You are going to take them up in sequence later?

Admiral McKEAN. Yes, to take them up in sequence; and give the headings, and the dates, so that the committee will know what they are, beforehand.

The logistic committee was formed with a representative from each bureau to determine what the minimum stock of industrial and consumable stores on hand should be, to enable the yards and supply bases to promptly meet the demands of the fleet, as contemplated in

ested and to get them trained for what they might expect to prepare for it; and the fleet were having practice runs along the coast as against an enemy, while we were having exercises in the department and in the navy yards, simulating what we could at that time, with the idea not that we were ready, but to find out where we were not ready; and in practice the efforts that we were making, theoretical.

One of the big things was the consolidation of the cable, and telegraph communications into the Communications Division of Operations.

The foundation of all success is communications.

This division handled 1,000,000 messages, averaging 100,000 per day for all departments and all activities of the Government during 1918, and controlled the censorship of cables and telegrams in the United States in all parts of the world.

The above preparations of the fleet for war were undertaken simultaneously in the fall and winter of 1915. It progressed as the appropriations would permit. After the declaration of war, the appropriations and allotments from emergency funds were obtained without difficulty, so that development of the fleet and the addition of other needed facilities to the fleet was secured. \$80,000,000 in Government-owned plants and about \$100,000,000 in private-owned plants to permit of their expansion and modernization, was secured.

There has been in addition to funds obtained for the development of the navy yards, and there has been before the war, a total of about \$300,000,000 spent on new naval stations, bases of various kinds, and industrial plants in the navy yards.

All of those developments are not completed yet, but are coming along fine, and if we had been a little earlier

Admiral McKEAN. Personnel in the navy yards is more closely related to material than anything else. I sometimes think it is aboard ship.

This can well be understood when it is realized that the total of the shipbuilding and ship repair trades at the beginning of the war amounted to an estimated 50,000; that the Shipping Board alone had in its employ at one time a maximum of 500,000. We were competing for this labor in the same market as the Shipping Board. Further, the committee's attention is called to the fact that this total of 75,000 mechanics in navy yards was all that, in my opinion, could be advantageously and efficiently used in these yards.

Our investigation of navy yards showed in the fall of 1915 that it was necessary for the Navy Department to establish separate bases for men, fuel ships' stores, etc., outside of the navy yards, and to use these yards exclusively for their primary purpose of docking, repairing, and building ships.

The Navy had grown, and the navy yard that used to be a training station, receiving ship, and supply base and fuel base and everything else could not handle the job any more.

The establishment of these supply bases was undertaken and proceeded with as rapidly as congressional appropriations permitted.

The General Board had revised and brought up to date the supplies they considered necessary to be carried in fuel bases, both coal and oil, and how much should be carried in each of the fuel stations. His revised plan required expansion of all the fuel stations to carry more coal; the building of tanks to hold more oil; coal and oil barges to transport this fuel and to carry a certain minimum stock afloat ready for emergency use.

This fuel problem was an expanding and difficult one, one of the most difficult of the war, but it was met by the Bureau of Supplies and Accounts successfully. And early in the war we had reached an available position as to fuel, for we had not only what vessels then operating from each port required, but we had sufficient reserve to take care of any movement of vessels that might be switched to any port up to the full capacity of the port.

This should be limited to the Atlantic coast.

Senator KEYES. Just to make it clear: You say "early in the war." Do you mean when we entered the war, or what date?

Admiral McKEAN. I mean early in the war so far as we were concerned.

Senator KEYES. When you speak of the war, you mean when we entered the war?

Admiral McKEAN. Soon after our entrance into the war. No, not at the beginning of the European war. We did not have the money at that time—we could not get it.

No vessel to my knowledge was delayed on this side of the ocean for lack of fuel during the whole of the war. In addition, in the period of fuel shortage, a number of essential activities, such as light and power plants of cities and munitions plants working for the army, the Navy, and the Allies were only kept going by the use of the Navy's fuel reserves.

On our going into the war, the naval district organizations were expanded wherever needed and to the extent needed to undertake their war functions; among these functions in addition to the police-

ing and protecting of the port, was the taking over and altering for governmental uses, repairing, fueling, and supplying of vessels assigned to the districts of which came into the ports within the district and the district authorities utilized for these purposes whatever private facilities were necessary to supplement those owned or commandeered by the Government. Thus at the maximum war load, we were utilizing, in addition to our own navy yards, what has been estimated at 70 per cent of the total private ship building and ship repair facilities in our country.

The progress made in development of bases and the accumulation of supplies did not proceed as rapidly as it would have done under normal conditions, but it will be remembered that even in 1915 our material markets and labor markets were already meeting the demands of the Allies for a large amount of munitions and that these demands, with all prices for material and labor were increasing.

We did not pay so much attention to prices. We got them as reasonably as we could, but what I mean is the trouble about prices was that we could not get so much for the dollars that you gentlemen appropriated.

After we entered the war and practically unlimited funds became available, the markets for material of all sorts were swamped with new orders from the War Department, the Navy Department, the Shipping Board, the Railroad Administration, Food Administration, Fuel Administration, etc.; in addition to the already existing demands of the Allies, which were largely increased on our changing from a neutral to a belligerent. These conflicting demands could not all be met simultaneously and the supplying of many of them was delayed necessarily until facilities could be provided for their manufacture.

In addition to the shortage of material, of factories, of power, ship repair, and ship building plants, was the shortage of the prime essential—labor. As shown above, we did not have the supply of skilled labor called for in the whole country, and at first it was not distributed so as to best meet the demands. Most serious of all, the draft drew a large number entirely out of industrial life, put them on the Army, Navy, and Shipping Board ships as operating and consuming forces instead of producing forces.

We took men out of the navy yards, even.

The conflicting demands of different interests were met in so far as they could be met and as rapidly as they could be met by the various activities of the War Industries Board, primarily by the priorities division, which determined after full presentation of the claims of the various interests which should have priority on certain items, certain plants, certain power, etc., and what claim of priority each item should have. It was necessary to determine priorities, even as to fuel and transportation, sand, gravel, and cement for construction purposes.

This priority situation involved a number of officers working on the War Industries Board, at least one representative from each bureau a large part of his time, and I, as general liaison officer of the Navy Department, representing all the bureaus and the military policy of the department at the same time, spent on an average two hours each day in pushing our claims and securing the priorities required by the items that day before the board.

I am putting this in to show the difficulty that we had, and why we could not instantaneously respond to all requests for material.

To give me an unquestioned official foundation for my claims before the priority board, I made out a list of types of craft in the order of their then importance in the war program of the Navy, and the first three of these items were destroyers, aircraft for antisubmarine use, submarines for use in the war zone in antisubmarine operations. I had no difficulty in securing the approval of the Chief of Naval Operations and the Secretary of the Navy to this list and presented it as the official Navy Department policy.

I had many contentions before the board with the Army and the Shipping Board to hold these priorities, and as an illustration of the attitude of the department, I met the claims of the Shipping Board for priority in securing of turbines for their ships over turbines for destroyers. Their plea was that the only way to defeat the submarine was to build tonnage faster than the enemy could sink it.

I argued that this was a purely defensive measure, necessary to be sure, but that the Navy insisted on the offensive at all times, and that while their (the Shipping Board) system was in effect, a scheme to "feed the submarines to death," the Navy's was to "poison" them and be done with them once and for all, besides saving the goods and guns which would be lost by the Shipping Board's system. Our system would, in addition, decrease the enemy morale. We iron, and destroyer material, labor, power, fuel, transportation, were given precedence over everything else for ourselves and everything else for our Allies, except what was shown by them to be actually needed at the front to enable their troops to hold on until we could get into the game in sufficient numbers to be of assistance.

I wish here to say that the same priority was given to the alterations and repairs of destroyers, yachts, chasers, etc., being fitted for duty overseas. This gave them precedence over capital ships of the fleet for repairs in the same way, and for the same reasons, that our whole building program for capital ships was absolutely stopped, so that men, materials, etc., could be concentrated for building destroyers, tugs, mine planters, chasers, etc., for use overseas against enemy submarines.

I wish to accent "overseas," for until this discussion came up, I never thought anyone had any doubt of the policy of the Navy Department that the war was in Europe and that Operations intended to keep it there.

The preceding narrative is intended to show:

First. That Operations was awake to the situation before the war and was doing its best within the appropriations to prepare the fleet for war, and to prepare the shore bases to maintain it in fighting trim during the war:

Second. That even before we became a belligerent the difficulties and prices were increasing daily, making progress slow and getting less for every dollar appropriated; and

Third. That when funds became available practically without limit, the demands on the material and labor markets were such that new facilities had to be built up to provide the material, and that unskilled labor had to be trained by hundreds of thousands to perform jobs calling for high skill and long training.

The above explains why it was impossible for the Navy Department or any other department to instantaneously or even in what

under normal conditions would be considered a reasonable time to meet the infinite numbers of demands made upon it.

As to the extent of these demands, there is submitted herewith a list of all types of vessels, completed and authorized or building on April 6, 1917, and a corresponding list of the date November 1, 1918, which shows that at the beginning of the war, April 6, 1917, we had 344 vessels of all types completed, 204 authorized or building, making a total of 548; that we had completed on November 1, 1918, 1,594 vessels of all types, that we had authorized or building 655, making a total of 2,249 vessels on November 1, 1918; that of this total there were on December 1, 1918, 463 vessels abroad, and in addition there were 100 other vessels traveling back and forth from Europe to the United States.

There is also submitted a memorandum of the head of the Division of Naval Districts, Rear Admiral Osterhaus, showing that we took over through commandeering, purchase, charter, or lease, 1,110 private vessels, motor boats, yachts, tugs, steamers, lighters, trawlers, and fishing boats, schooners, tankers, ferry and houseboats and barges; that in addition to this 1,110 we took over from other Government departments, Coast Guards, Lighthouse Service, Coast and Geodetic Survey, Immigration Service, Public Health Service, Bureau of Fisheries, Panama Canal, and borrowed from the Canadian Government a total of 135, making a grand total of vessels taken over, converted to Government use and equipped for Government service, 1,245 craft of all types, sizes, and kinds.

The CHAIRMAN. These were all taken over after war was declared?

Admiral McKEAN. Yes, sir; we had no authority to take them over before.

The CHAIRMAN. We had not purchased or authorized any of them before?

Admiral McKEAN. No, sir; none of these.

That in addition to the above, we converted to troop transports and the Navy operated for the Army a total of 149 transports. This includes 25 of the Navy's battleships and cruisers; but even then we had to add some conversion work on them to fit them for troops.

That, in addition to the above commencing in February, 1917, we remodeled for armed guard and the carrying of guns 384 merchant vessels; including vessels for our allies as well as our own.

That, during the later part of the war, in addition to the fighting fleet and vessels given above, the Navy Department operated and maintained 378 vessels in the Naval Overseas Transportation Service.

Each and every one of these vessels referred to above required some alteration to adapt her to the new service. A great many required extensive repairs. All made demands on material and labor for maintenance throughout the time of their service. This was in addition to the building, repair and maintenance of vessels of the regular Navy, and these activities were carried on at the same time as the others, involving the building of new types and the repair of the main fleet units, but the work of the various classes was kept separate in so far as possible and placed in different yards, and when in the same yard, priorities were given in the order of relative importance and the urgency for each type, and the highest priority was, as previously stated, always given to craft for overseas, and first of these craft, to destroyers.

Now I give a list of activities that fall under material, but that has been covered before in general, except paragraph (g).

Among the activities requiring material, the following may be mentioned:

(a) The preparation, placing, and patrolling of mine fields, submarine nets, etc., for the protection of our own important home ports and bases.

(b) The alterations and items on Coast Guard craft, etc., for service.

(c) The building of a large number of submarine chasers, total order 450, including 30 for the French and 5 for Italy; the first of this type of craft being ordered at the Navy yard, Norfolk, before this country went into the war at all.

(d) The alterations of merchant vessels to fit them to carry guns and armed guard.

(e) The repair of German ships and their conversion into troop transports; the 16 large passenger craft most successful of all troop transports.

(f) The conversion of Shipping Board ships to carry troops.

(g) The supply of material for construction and operation of bases abroad.

In this connection a reference is made in previous testimony that carried the suggestion that officers were sent to Brest and Bordeaux to establish bases without detailed plans and instructions. This was undoubtedly true. How anyone in Washington could work up detailed plans and instructions and furnish detailed supplies for the establishment of bases in locations with which they were not familiar, I do not know. These officers were given whatever material the conditions at the time they left indicated would be necessary, and it was on their reports and at their requests that these bases grew from small units for the maintenance of the few yachts and destroyers we then had on the French coast, into bases that handled a very large percentage of our troop transports, convoys, etc., through the war; and while no doubt the people on the ground would have liked to have had the material and personnel to develop these bases faster, both the material and personnel were furnished from Washington as rapidly as we could get hold of it and get the tonnage to take it across.

I would like to say that they were not in a bit bigger hurry than we were.

One of the big items of material was the equipping of all ships used in our war activities with radio. That looks easy, but the electrical supplies were short, and early in the matter we had great difficulty, and we could not operate those ships in convoy or singly without complete radio outfits or without completely trained operators on board.

(h) The development of submarine-detecting devices and testing out of all the submarine schemes proposed.

That called for new material, new inventions; and we employed the best talent there was in our country, or they volunteered for it; but this was not with the hope of finding any "royal road to victory," but having in mind the failure of our Allies in over two years of war to overcome the submarine menace by the methods then in use, we were doing everything within the capacity of our material and personnel along every line that had proven even partially successful, and at the same time we were trying to improve on old methods and develop new ones.

(i) The material, labor, and tonnage required for the northern mine barrage, one of the greatest and most successful undertakings of the war, and one that had its share in breaking German morale.

No one supposed that any one scheme in operation or contemplated would prove 100 per cent efficient; but we did expect that with destroyers, armed guards, mine barrages, air patrols, subchasers, etc., we would reduce the submarine menace below the danger point, and we did hope these various methods combined would, in the end, break the enemy's morale; or, in slang, that we would "get the Hun's goat." We did, and the final smash of Hun morale started in Kiel, the home port of a large number of German submarines.

While there were and always will be delays, delays of subordinates in coming to conclusions on which to base their recommendations; delays in convincing superiors of the desirability or necessity of approving these recommendations; delays in getting the necessary appropriations; delays in obtaining material and men with which to carry out the plans. While each and every one of these delays is annoying to the man waiting for the completed results, as well as to the one in immediate charge of pushing the plan through, it is a fact that responsible authorities, the Chief of Naval Operations, the Secretary of the Navy, the committees of Congress must each be given time for consideration and deliberation to enable them to act wisely.

I do not believe that the sum total of all these delays prior to our entering the war, or after our entering into the war, gives the slightest foundation for anyone to justly make the charge against the Navy Department that it was responsible for delaying the end of the war four months.

Nor do I believe that anyone, short of the good God Himself, has sufficient knowledge of the various elements and factors entering into the war and the causes of its conclusion to justify him for one moment in charging that the Navy or any of its officers were responsible for the loss of any part of the two and one-half million tons of allied shipping claimed to have been unnecessarily lost; nor for any part of the \$15,000,000,000 of the Allies' money claimed to have been unnecessarily spent; nor, least of all, do I believe that there is any human being with sufficient information and sufficient knowledge to justify him in charging the unnecessary loss of the life of one of the 500,000 allied soldiers charged to have been due to the errors of the Navy.

This monstrous charge has been or will be disproved in every item. Had it been made by any foreign official, allied or enemy, it would have aroused the indignation of the whole American people. Had it been invented by the inflamed, exaggerated, diseased ego of a patient in St. Elizabeth's, the Government Hospital for the Insane, no one would have been surprised. That it was made under oath by a Rear Admiral of the United States Navy on the active list, president of our Naval War College, in a hearing before a committee of the United States Senate, is, in my opinion, an insult to every officer and man now in the Navy, or who served in the Navy during the World War.

At this point the subcommittee adjourned until to-morrow, Wednesday, April 28, 1920, at 10 o'clock a. m.

NAVAL INVESTIGATION.

WEDNESDAY, APRIL 28, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in Room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Keys, and Trammell.

TESTIMONY OF REAR ADMIRAL JOSIAH S. McKEAN—Resumed.

The CHAIRMAN. The committee will come to order. Admiral McKean, will you proceed?

Admiral McKEAN. As I stated yesterday, Mr. Chairman, I propose to introduce a series of papers from the files of the Navy Department, commencing from the period when I became assistant for material, to the Chief of Operations, on July 1, 1917.

The first paper is, however, a letter from the Secretary of the Navy or an order from the Secretary of the Navy to me covering the same correspondence that was covered in the case of Capt. Pratt, directing in so far as my work comes under your request for documents, those documents asked for. You remember Capt. Pratt's case?

The CHAIRMAN. Yes.

Admiral McKEAN. It is the same letter.

The CHAIRMAN. Are you submitting documents to cover everything in that letter?

Admiral McKEAN. I have not all those dispatches, but they are being gotten together. I cover a certain part of it. Capt. Pratt covered certain other papers, and his dispatches, in so far as they could get them, are being collected now, I believe, in the department.

The first paper I wish to submit is the report of April 6, 1917, covering every vessel then in the Navy, giving her location on February 6, 1917, March 6, 1917, and April 6, 1917, and in two columns, the status of readiness, being readiness for distant service. The two columns are "Yes" and "No." And then in the remark column, where the vessel was unready, the reason for such unreadiness, whether from personnel or material, or both, as to every ship we had, taking the battleships first.

The CHAIRMAN. That statement does not give to what extent they were ready, does it?

Admiral McKEAN. No; except in certain cases of the destroyers some of them are marked "Unsuitable," and then in cases of tugs, some of them are yard tugs, which means that they are not available for distant service at all, are not of the right type, and some of them are too old.

TABLE A.—Report of readiness, Apr. 6, 1917—Continued.

B is a table that I referred to in my statement, showing the vessels by types, battleships, and so on, the number of vessels completed on April 6, 1917, the number authorized or building, and the total. The same figures are given for November 1, 1918. And in another column is given the number of vessels of each type abroad on December 1, 1918. That is just taken as completing the turnaround, because we had the data of that date. That was after the armistice, but it was still the carrying on, bringing the troops home and that sort of thing. On December 1, 1918, we had not gotten much stuff back then. This shows the number that were running back and forth in the transport of troops, etc.

The table B last referred to is here printed in full in the record, as follows:

TABLE B.

| Type. | Apr. 6, 1917. | | | Nov. 1, 1918. | | | |
|------------------------------------------------------|-----------------|---------------------------------|------------|-----------------|---------------------------------|--------------|-------------------------------|

1 Back and forth.

The CHAIRMAN. Admiral, I made several requests to the Secretary for this information about the condition of the ships on April 6, and on dates prior thereto, and I did not get the information that I wanted. However, recently the Secretary has told me that you and Capt. Pratt would give me information on this matter.

Admiral McKEAN. Yes, sir.

The CHAIRMAN. On April 21 I wrote a letter to the Secretary, which I will show you now, and which I will put in the record at this point, as well as his reply.

(The letters referred to, which were here handed to Admiral McKean and examined by him, are as follows:)

APRIL 21, 1920.

To HON. JOSEPHUS DANIELS,
Secretary of the Navy.

DEAR MR. SECRETARY: It is requested that the Navy Department furnish the following information to the Senate Subcommittee on Naval Affairs on or before Wednesday next, the 28th of April:

I. For each and every individual battleship on the Navy list on the 2d of February, 1917—

(a) State whether in full commission, in commission in reserve, in commission in ordinary, or out of commission.

(b) State exactly where located then.

(c) State number of days then necessary to make material repairs essential for war service.

(d) State number of rounds of shells then on board for main battery.

(e) State percentage of personnel then on board in terms of per cent of full war complements as 100 per cent.

II. For each and every individual battleship on the Navy list on the 6th of April, 1917—

(a) State whether in full commission, in commission in reserve, in commission in ordinary, or out of commission.

(b) State exactly where located then.

(c) State number of days then necessary to make material repairs essential for war service.

(d) State number of rounds of shells then on board for main battery.

(e) State percentage of personnel then on board in terms of per cent of full war complements as 100 per cent.

III. For each and every individual battleship on the Navy list on the 7th of April, 1917, which was then not in proper material condition for instant war service overseas and which then had not on board its full complement of officers and men:

(a) State date upon which the making of necessary repairs was started.

(b) State date upon which the making of necessary repairs was completed.

(c) State yard (or other place) where repairs were made.

(d) State date upon which each ship obtained its full war complement of officers and men.

IV. State for each and every individual battleship its apportionment of reserve shells for its main battery in terms of rounds for each ship calculated from the total reserve of shells ready but not on board on the 7th of April, 1917.

V. For each and every individual cruiser on the Navy list on the 2d of February, 1917:

(a) State whether in full commission, in commission in reserve, in commission in ordinary, or out of commission.

(b) State exactly where located then.

(c) State number of days then necessary to make material repairs essential for war service.

(d) State number of rounds of shells then on board for main battery.

(e) State percentage of personnel then on board, full war complement being taken as 100 per cent.

VI. For each and every individual cruiser on the Navy list on the 6th of April, 1917:

(a) State whether in full commission, in commission in reserve, in commission in ordinary, or out of commission.

(b) State exactly where located then.

(c) State number of days then necessary to make material repairs essential for war service.

(d) State number of rounds of shells then on board for main battery.

(e) State percentage of personnel then on board, full war complements being taken as 100 per cent.

VII. For each and every individual cruiser on the Navy list on the 7th of April, 1917, which was then not in proper material condition for instant war service overseas and which then had not on board its full war complement of officers and men:

(a) State date upon which the making of necessary repairs was started.

(b) State date upon which the making of necessary repairs was completed.

(c) State yard (or other place) where repairs were made.

(d) State date upon which each ship obtained its full war complement of officers and men.

VIII. State for each and every individual cruiser its apportionment of reserve shells for its main battery in terms of rounds for each cruiser calculated from the total reserve of shells ready but not on board on the 7th of April, 1917.

IX. For each and every individual destroyer on the Navy list on the 2d of February, 1917.

(a) State whether in full commission, in commission in reserve, in commission in ordinary, or out of commission.

(b) State exactly where located then.

(c) State number of days when necessary to make material repairs essential for war service.

(d) State percentage of personnel then on board, full war complements being taken as 100 per cent.

X. For each and every individual destroyer on the Navy list on the 6th of April, 1917

(a) State whether in full commission, in commission in reserve, in commission in ordinary, or out of commission.

(b) State exactly where located then.

(c) State number of days when necessary to make material repairs essential for war service.

(d) State percentage of personnel then on board, full war complements being taken as 100 per cent.

XI. For each and every individual destroyer on the Navy list on the 7th of April, 1917, which was then not in proper material condition for instant war service overseas and which then had not on board its full war complement of officers and men.

- a. State date upon which the making of necessary repairs was started.
- b. State date upon which the making of necessary repairs was completed.
- c. State yard (or other place) where repairs were made.
- d. State date upon which each destroyer obtained its full war complement of officers and men.

XII. State number of depth bombs for use on destroyers on hand and ready 7th of April, 1917.

It is requested that the Navy Department's report in reply be accompanied by separate tabulation for battleships, cruisers, and destroyers as per the inclosed forms.

Yours truly,

FREDERICK HALE.

DESTROYERS.

THE SECRETARY OF THE NAVY,

Washington, D. C., April 23, 1920.

MY DEAR SENATOR:

I am in receipt of your favor asking for certain information, and in reply I have to state that I have asked the Office of Naval Operations to prepare a statement which will give you the information requested.

Sincerely, yours,

JOSEPHUS DANIELS.

HON. FREDERICK HALE,

United States Senate, Washington.

Admiral McKEAN. This is the first time I have seen this letter, Mr. Chairman. I think that it is possible that I have submitted here what will answer your questions for each type of ship, under sub-heads "A" and "B," but as to the others, it will take the various bureaus of the department concerned some time, and in some cases it will have to be referred to the yards to collect that data, and I suppose that it is being done. I had not seen this before, but your letter would be rather to the bureaus. For instance, as to ammunition, it would have to go to the Bureau of Ordnance. Second, it would have to go to the Bureau of Navigation, and they will have to go through a great many things.

Then, as to the repairs, the two bureaus of Construction and Repair and of Steam Engineering may be able to answer that in the office of material, but in some cases they would have to refer to yards. I have some other tables taken in connection with this, and that will show for the battleships, the dreadnoughts, and the predreadnoughts, and the battle cruisers, the number of days repair in each of three years, 1917, 1918, and 1919. I got that up as illustrative material independent of this. I got the officers in the department to get it together for me.

The CHAIRMAN. The committee would like to have some table that represents the whole matter clearly, so that we will not have to refer to different papers.

Admiral McKEAN. I understand, sir.

The CHAIRMAN. Will you see that it is made up in the form requested in this letter?

Admiral McKEAN. Will you let me have this copy?

The CHAIRMAN. Yes; and submit it to the committee as soon as possible, because we want to wind up the record.

Admiral McKEAN. It is going to take some time unless they have been working on it from the jump off. It will take some little time to get that data together and get it tabulated; but the department can do it, I am sure, and I will take it up.

As to the figures I have just cited, I gave those in my direct testimony yesterday.

Memorandum C is the memorandum I also referred to in yesterday's testimony from Admiral Osterhaus, showing the vessels taken over through the naval districts division during the whole period of the war through commandeering, purchase, charter, and lease, and also the total number of vessels taken over during the war from other governmental departments. That includes all sorts of vessels, motor boats, yachts, tugs, steamers, steam lighters, trawlers, and fish boats and barges, and so on, while the vessels taken from other Government departments include Coast Guard, Lighthouse Service and other vessels; cargo vessels converted to troop transports and operated by the Navy for the Army.

The list C last referred to is here printed as follows:

C.

MARCH 19, 1920

MEMORANDUM.

1. The following gives a grand summary of the total number of vessels of various types which were taken over through the naval districts division during the whole period of war, either through commandeering, purchase, charter, or lease; also the total number of vessels taken over during the war from other governmental departments:

1. Private vessels taken over by the Navy (through commandeering, purchase, charter, or lease):
- | | |
|----------------------------------|----|
| Motorboats..... | : |
| Yachts..... | : |
| Tugs..... | : |
| Steamers..... | : |
| Steam lighters and lighters..... | : |
| Trawlers and fishboats..... | : |
| Tanker (oil)..... | : |
| Ferry and house boats..... | : |
| Barges..... | : |
| Total..... | 1, |

Taken over by Navy from other Government departments and assigned duty in naval districts during war:

| | |
|-----------------------------------------------------------|---------------|
| Coast Guard..... | 41 |
| Lighthouse Service..... | 50 |
| Coast and Geodetic Survey..... | 4 |
| Immigration Service..... | 2 |
| Public Health Service..... | 1 |
| Bureau of Fisheries..... | 4 |
| Panama Canal..... | 6 |
| Canadian Government (loaned) (drifters and trawlers)..... | 27 |
| Total..... | 135 |
| Grand total..... | 1, 245 |

H. OSTERHAUS.

Total number of cargo vessels, etc., converted to troop transports and operated by the Navy for the Army:

| | |
|-------------------------------------------------------------------------------------|------------|
| Cargo vessels..... | 70 |
| Battleships and cruisers..... | 25 |
| Ex-German..... | 9 |
| Ex-German and American passenger vessels carrying troops previous to armistice..... | 45 |
| Total..... | 149 |

Total number of merchant ships remodeled for armed guards and guns, 384.

Total (highest) number of N. O. T. S. ships, 378.

December 10, 1918.

Appendix D is the first of a number of departmental policies which I succeeded in having established as assistant for personnel, and which I referred to yesterday, and my effort was wherever I could establish a general policy that was applicable to a great many conditions and circumstances, I would write out this policy, that is, as to material, get my chief's approval and the Secretary's approval, so that we would not have to take up every individual case of every individual ship, and thereby cause delay with the bureaus or yards, and the fleet as well as the Secretary and the Chief of Operations; so that having established these policies, everybody would know the plans along which we were working and the effort was to reduce correspondence, reduce detailed orders, and reduce the time that I had to spend in getting signatures to separate papers. [Reading:]

D.

NAVY DEPARTMENT,
Washington, August 10, 1915.

To: All bureaus and navy yards and stations, commandant Marine Corps, commander in chief, and board of inspection and survey.

Subject: Regular overhaul periods of vessels abolished.

1. The department announces the abolition of the regular three months overhaul periods for all ships. There will be two docking periods yearly, not to exceed two weeks each.

2. Only necessary repairs, beyond the capacity of the fleet, previously authorized and which can be done within the docking period, shall be performed by the navy yard.

3. Vessels will go to navy yards for yard work at other than docking times only when absolutely necessary to maintain their military efficiency, after recommendation by the board of inspection. The ship will not be ordered to the yard until the yard reports all plans and material ready to begin actual work, after approval of estimates, and work will be pushed to completion by ship and yard forces. In this connection the following is quoted from department's letter No. 28024-161 of July 29, 1915, relative to repairs on Delaware.

Then I quote an illustrative letter in regard to the *Delaware*. The ships had been going to the yards once every 15 months for a three months overhaul period, whether they needed the overhaul or not. The men were given leave, the officers got their leave, and it meant that your ship was in the yard at least for that 3 months out of every 15 months, besides the other docking period. We attempted to increase the number of available days for operating with the fleet, to reduce the number of days in the navy yard, to reduce the cost by making the ship's force do all they could, and the repair ship do all she could, before the ship went to the yard, and to keep ships out of the yards, because our yards were inadequate to sustain the fleet even in 1915; and it was along that line we were working in establishing that system. This letter is as follows: [Continuing reading:]

4. The *Delaware* is at that stage of her career where a complete and thorough overhaul is absolutely necessary to secure the safety of the personnel and the life of the metal and equipment. Owing to the service which she has been called upon to perform, the readiness in which she had been held, and the continual shortening of overhaul and docking periods, items of overhaul have been postponed until attention to them is imperative.

The department does not desire that any vessel be permitted to leave a navy yard after an overhaul in a condition that allows any doubt to exist as to the ability of the vessel to maintain its position in the fleet or respond to any full-power trial. The object of an overhaul is to place the vessel in the best material condition for battle, and while it is desirable to limit the stay of a vessel at a navy yard so far as possible, this should not be done at the expense of military efficiency.

We were preparing the fleet all the time, from my desk point of view, for fighting. That is the only reason we sent ships to the navy yards. [Continuing reading:]

4. Only such alterations will be approved as are clearly necessary to definitely and directly increase her military efficiency, either by increasing her "h. p. g. p. m.": her knots per hour or per pound of fuel, or by increasing the health and vigor of the crew, or decreasing their necessary routine labors which will increase their military efficiency.

5. All ship's spare parts and equipment at yards and on board should be immediately replaced when used or old ones repaired if advisable for replacement.

6. An "availability factor" is to be introduced in the "battle efficiency" computation.

That was to introduce the competitive business we had in target practice, a ship being self-maintaining, and being of use for more days in the year. I made up a table for the three previous years, which showed that the average ship had been 33½ per cent of her time in the navy yard, although the average steaming at that time was only, for a battleship, about 10,000 miles a year. Our effort was to increase her military efficiency and reduce that percentage of time in the navy yard, and we were getting along fine up to the time the war broke out. [Continuing reading:]

7. Leave periods will not be coincident with docking or repair periods for following reasons.

That was prolonging the stay in navy yards. The men got the idea—and the officers, too—that they could put off jobs that would last until they got their overhaul period, and then the yard would do it and they would not have to do it. [Continuing reading:]

7. Leave periods will not be coincident with docking and repair periods for following reasons:

- (a) Navy yard inspection now reduced to that done by ship's officers.
- (b) Ship's force should do all work within their capacity according to the provisions of law.

- (c) Time in yard will be reduced and consequent disorganization of crew minimized.
- (d) Leave period should follow overhaul to encourage everybody, officers and men, to reduce stay in yard to minimum.

Then, here is another policy which is important:

8. New construction will be used by the yards in endeavoring to maintain a uniform labor roll. In this connection attention is invited to policy already announced in department's letter No. 8557-167, of July 29, 1915, pertaining to work on *Tacoma*, which reads in part as follows:

"The industrial manager, Portsmouth Navy Yard, has requested that work on the *Tacoma* be postponed as necessary, partly in order to maintain a uniform labor roll at the yard, and partly due to insufficient money allotments.

"The department takes this occasion to announce the following policy: When a vessel suitable for war service arrives at a yard to be placed out of commission, in reserve or in ordinary, her full crew of officers and men will be kept intact until all authorized work is completed and the vessel is placed in the best possible material condition for battle. Work to this end will proceed with the utmost dispatch following approval of estimates after inspection by the board of inspection and survey. Such vessel will not be used for the purpose of maintaining a uniform labor roll (new vessels under construction should be used for this purpose); and such money allotments should be requested as necessary to carry out the general policy outlined above."

That was to provide for ships going into reserve being put into fit condition before they went into reserve, so that the reserve complement I spoke of yesterday could keep them fit, and so that we would know that when we called on them, they would be efficient for business. [Continuing reading:]

9. Sufficient time must be allowed officers and crew to perform routine overhaul and necessary repairs on board, as required, to the end that each ship will at all times be in first-class condition and able to properly maintain station in battle line.

That was necessary because always, when we get to sea, especially flag officers, we want all our ships all the time. That is the only training that a flag officer gets and he hates to see one of his ships drop out of his division, because then he only has three; and it is a good deal like an old hen with her chickens, he wants the whole crowd there all the time, because that is where he gets his training for fighting, and if you do not watch for and catch them, they are unconsciously and unintentionally liable to sacrifice the opportunities for repairs and improvement to their own training and operations. I am now looking at it from a different point of view from that at the time when I wrote that letter. I will probably have to be posted myself, now, to give the ships a chance. [Continuing reading:]

10. The department believes that the policy above outlined will materially increase the military efficiency of the fleet, and was largely influenced in its decision by the following favorable resultant items:

- 1. The military efficiency of the "fleet" becomes of first importance and yard activities supplemental thereto.
- 2. All officers and men on board to assist in and inspect work at yards.
- 3. Reduced expenditures for alterations which do not increase efficiency of ships.
- 4. Maintain continuous efficiency of each ship.

There is a thing that we had to watch all the time. Every captain and every officer of a ship wants for his ship—never mind what her vintage was—all the latest fittings, target practice and signals and all that. He wants his ship just as good as anybody else's, and it is very proper that he should feel that way; but we had to put time limits on some of them, and we could not take the *Kearsarge*, for instance, and remodel her to bring her up to the efficiency of the

Pennsylvania, because we would have had to rebuild a ship under the name of repairs and then we would not have had anything but an old one-horse shay, anyway; so that we limit and classify the repairs that can go on ships. One class we will bring up to date and another class up to another date, depending on their age, and we will save money and save the navy yards. [Continuing reading:]

11. The docking periods for the battleships of the Atlantic Fleet will be as follows: All ships at home yards October 1 to 15, 1915; April 15 to 30, 1916; and October 1 to 15, 1916.

12. Exceptions to the above policy will only be made on approval of the department. Work already authorized on ships for overhaul period October–December, 1915, will be carried out, but should be pushed to prompt completion.

JOSEPHUS DANIELS.

That was the previous overhaul period set for the ships before their going south to the southern drill ground in the winter of 1915–16.

Senator TRAMMELL. The date of that letter is August 10, 1915?

Admiral McKEAN. August 10, 1915; yes sir. I think I said that was the first policy, but I notice that the one previous to that was July 29, 1915.

The next memorandum is dated August 24, 1915. [Reading:]

E.

NAVY DEPARTMENT,
Washington, August 24, 1915.

Memorandum for Chief of Operations.

Policy as to preparation of the fleet materially for war and its maintenance in readiness at all times.

(1) Active fleet: All vessels in commission with the active fleets in the Atlantic Fleet, Pacific Fleet, Asiatic Fleet.

(2) Reserve fleet: All vessels in reserve, ready materially but with only reserve complements of officers and men on board.

(3) Coast-defense fleet (includes advance bases): (1) Coast-defense battleships, (2) coast-defense monitors, (3) coast-defense submarines, (4) coast-defense surface torpedo craft, (5) coast-defense hydroplanes, (6) coast-defense dirigibles, (7) coast guard patrols, (8) lighthouse tenders (patrols), (10) coast mine planters, (11) coast mine trawlers, (12) converted yachts, (13) gas power boats for offensive against subs.

Those are vessels that are not intended for foreign service under any conditions. They had been relegated to the rear rank, for coast defense pure and simple. [Continuing reading:]

1. The active fleet: All units of the active fleet to be kept in first-class condition at all times by the crews. Whenever repairs beyond the capacity of ship's force are found necessary, then the procedure laid down in department's letter No. 20392–560 to be followed.

2. The reserve fleet: All ships now in reserve to be immediately placed in first-class condition and then to be so maintained by the reserve complements assigned to them. To be at all times ready for immediate commissioning for service with the active fleet. Vessels hereafter going into reserve will follow the procedure laid down in department's letter No. 8557–167 of July 29, 1915.

3. Ships in ordinary: These vessels will be at once put in material condition to permit them to perform their war duties as coast defense vessels. The nucleus crews assisted by the organizations—Naval Militia and Naval Reserves—who will constitute the crews of these vessels in war will maintain them in efficient condition. They will only be sent to navy yards for docking repairs beyond the capacity of ship's force.

That is, we were not going to spend any more money on those ships than was necessary to keep them fit for that duty alone, of coast defense.

Next is the policy letter which I have marked "F." [Reading:]

F.

POLICY.

No. 20392-560.

NAVY DEPARTMENT,
Washington, August 27, 1915.**To:** Commanders in Chief Atlantic Fleet, Pacific Fleet, Asiatic Fleet, Atlantic Reserve Fleet, Pacific Reserve Fleet.**Subject:** Overhaul of ships.**Reference:** (a) Department letter 20392-560 of August 10, 1915, regular overhaul periods abolished.

1. In order to assist in carrying out the provisions of reference (a), the commander in chief will report to the department when it becomes evident that a ship will, in the near future, require considerable navy-yard work.

That is to give us notice in the yards.

2. Date when the ship can best be spared for overhaul should be noted. Also inform the department when the ship will be at her home yard for inspection, in order that the board of inspection and survey may be instructed.

3. The inspection should be held sufficiently in advance of time proposed for beginning work, to enable the yard to make its plans and provide material after receipt of approved estimates based on report of inspection.

FRANKLIN D. ROOSEVELT, *Acting*.

You can see, there, the policy was to send the ships and to have them inspected, and based on that inspection to send them to the navy yard, and to make those plans and estimates and collect the material and as soon as the inspection was completed of a ship she went back to the fleet, and then she would not go to the yard until the yard reported to the commander in chief that they were ready to go ahead with her. Our plan was that when she came into the navy yard and the gangplank went out, the workmen came aboard ready to go to work.

The CHAIRMAN. What would become of her if the yard was not ready?

Admiral McKEAN. They would not let the commander in chief know, and if they did not make their dates, I or some one in my office went up to find out why.

The CHAIRMAN. But after a ship was reported ready for repairs, provided the yard was not ready to take her in, what would happen to the vessel? She would stay at the yard?

Admiral McKEAN. You see, she would first go to the yard for inspection, and then she would go back to the fleet and work with the fleet so as not to interfere with her drill and training of the men, until the yard was ready for her. Often the yard was not ready for her as quickly as we would have liked, because of lack of capacity to do the work that was to be done.

Here is a circular letter which I have marked "G," of September 3, 1915. [Reading:]

G.

CIRCULAR LETTER.

NAVY DEPARTMENT,
Washington, D. C., September 3, 1915.**To:** Commandants of navy yards and stations, all bureaus and commanders in chief.
Subject: Docking of vessels during overhaul

1. Hereafter when a vessel is to be docked during an overhaul period, the docking should take place as early as possible during the period in order that any defects developing from an inspection while in dock may be noted and full information pertaining thereto be available for the completion of any necessary work entailed within the period set for that overhaul.

FRANKLIN D. ROOSEVELT, *Acting*.

The purpose of that was, we had a particular case; a ship had been in a yard for a month or two months, I have forgotten just the time, and we always liked to have her go out with as clean a bottom as possible. The next docking will be dated from the last. We had had this ship there for two months. We put her in the dock and pumped it out and found a defective shaft which we had to remove. We had expected her to go out in four or five days, but she was as long getting this shaft repaired as it took to do the other work. To avoid such things as that, we would put her in and clean her bottom, inspect it and inspect the fittings, and if there was work to be done on her of that sort we did it at the same time we did this other work above water, so as to save time. That was the beauty about having this policy developed. Everybody knew about it. I do not mean that it is a completely developed system yet, but it is better than none.

Here is a series of memorandums which I have marked "H." There is a good deal of this particular thing, but it is illustrative of what we were doing toward developing shore stations and navy yards to take care of ships, and, as I stated in my narrative yesterday, the first thing that I discovered was the absolute inability of the navy yards to take care of the fleet, and I was trying from the beginning to build up these bases so that they could. The policy had been that every dollar of appropriation should be spent and go to sea; and I have heard it very thoroughly approved of by members of both the majority and the minority of the House Naval Committee; and I had a hard time getting them to see it the other way; that we had to have our yards, and that you could not operate ships without bases to work them from. I was decidedly in the minority in the hearings for some time. This first memorandum is dated September 25, 1915. [Reading:]

H.

[Ref. A.]

NAVY DEPARTMENT.
Washington, September 25, 1915.

Memorandum for Chief of Naval Operations.

Subject: Navy yard, Norfolk, training station, St. Helena, etc.

1. The department now has before it for consideration several propositions affecting the whole future of this yard and station. They are interdependent and should be considered together and a final definite scheme for the development of this most important yard and station should be adopted and hereafter followed until the yard has reached the full limit of its usefulness.

2. The various subjects in the order of their importance are as follows:

1. The location of a new dry dock.
2. The location of torpedo-boat building ways.
3. The provision of the necessary fuel-oil storage.
4. The remodeling or abandonment of St. Helena as a training station, doing away with receiving ships, etc.
5. The location of a submarine shore base.
6. The widening of the channel between the yard and training station to permit of the safe handling of large ships.

3. In order that this whole question may be settled satisfactorily and a consistent plan be developed, it is recommended that a board, consisting of the Chiefs of Bureaus of Navigation, Construction and Repair, Yards and Docks, and the assistant for material in the Office of Chief of Naval Operations, with the Assistant Secretary of the Navy as chairman, be ordered to meet at once and consider and report on the whole subject and submit a definite plan at the earliest practicable date.

This was done. The report of the board is attached, dated October 12, 1915. It gives the general recommendations with reference to the development of the Norfolk yard. [Reading:]

[Ref. B.]

OCTOBER 12, 1915.

To: The Secretary of the Navy.

Subject: Report of the board submitting a definite plan for the future development of the Norfolk Navy Yard and Station.

1. In obedience to your order of October 6, 1915, the board met in the office of the Assistant Secretary of the Navy on Saturday, October 9, 1915, and considered all the previous reports, blue prints, and correspondence in connection with the various subjects before it.

2. In view of the ships built, building, and planned and the growing importance of the Norfolk Navy Yard to the fleet, the board considers it absolutely necessary to begin immediately the development of the Norfolk Navy Yard to meet modern conditions.

3. To make such development economically and efficiently, the board is of the opinion that the layout of the water front and its development is the first logical step.

4. There is attached hereto a blue print showing the general layout of the Schmoele tract water front, the location of the dry docks, the location of the building ways, the general location of the working basin, principal shops, and the turning basin.

5. The board took up for consideration the various subjects referred to it in the order given and submits recommendations thereon as follows:

(1) The location of the first new dry dock. The board recommends the location adopted by the department in its seventh indorsement of July 23, 1915 (No. 5267-479), as shown on Yards and Docks blue print 64669; also shown on the attached blue print.

(2) The location of torpedo boat building ways. The board recommends the location adopted by the department in its seventh indorsement of July 23, 1915 (No. 5267-479), as shown on Yards and Docks blue print No. 64669; also shown on the attached blue print.

(3) The provision of the necessary fuel-oil storage. In view of the interference with other more important developments and the danger of fire to shops, buildings, and ships at the yard, the board recommends:

(a) That there be no further oil storage located on the Schmoele tract.

(b) That there be no further oil-fuel storage located on St. Helena.

(c) That future oil storage be underground on a convenient site located on Hampton Roads, the James River, or the York River.

(d) That the oil-fuel storage be located on the new site selected for the training station, if there be sufficient room, and it can be made sufficiently accessible to ships, barges, etc., by piers or pipe lines.

(4) The remodeling or abandonment of St. Helena as a training station, doing away with receiving ships, etc.

After considering fully all the features of the training station, its defects and limitations, and having in mind the importance of this station to the fleet, the board submits the following recommendations:

(a) Abandon St. Helena as a training station as being inadequate and unsatisfactory in every way even for present conditions and numbers. Also do away with receiving ships and substitute therefor barracks. (The above with a view of economy of maintenance and efficiency.) The present station interferes materially with the full utilization of the navy yard for industrial purposes and military use as a submarine base.

(b) The purchase of a new site and the transfer thereto of the present training station as soon as possible. This new site to be located either:

First. On Hampton Roads, where in addition to serving as training station, it could be used for recreation grounds for the fleet, and as oil fuel station;

Second. On the James River; or

Third. On the York River, in the vicinity of Yorktown.

(5) The location of a submarine shore base. The board recommends that the water front of St. Helena be dredged back to give a minimum of channel of 800 feet between the present yard sea wall and the pierhead line on St. Helena and that the remainder of the St. Helena tract be filled, graded, and developed as a submarine shore base; that this work be provided for in the present appropriation bill, and executed as promptly as possible, all work except dredging and filling to be charged to appropriation for submarine shore base.

(6) The widening of the channel between the yard and the training station. Provided for as above in paragraph 5, by dredging the shore line of St. Helena, so as to give a minimum width of 800 feet between the yard and the pierhead on St. Helena.

(7) The board recommends that the development of the Schmoele tract be as outlined in the attached blue print, commencing with the dry dock and building slip and working toward the south. That coincident with this development the turning basin be dredged to a diameter of 1,500 feet (see blue print), and that the widening of the channel along the front of St. Helena and between St. Helena and the turning basin be proceeded with as soon as possible, this with the idea that the water front and channel development shall be entirely completed prior to the completion of the new Dry Dock No. 4, to permit its immediate use by the largest ships.

7. The board recommends that the following estimates be included in this year's appropriation bill to permit the undertaking of the most urgent of the above recommendations:

(a) Five hundred thousand dollars for—

(1) Development of the water front in the vicinity of the new dry dock and building ways.

(2) The dredging of the turning circle.

(3) Dredging of the channel and water front at St. Helena.

(b) Four hundred thousand dollars for the purchase of the new site for the training station and the removal of the station to such new site. The board recommends that this appropriation be made immediately available in order that the new station may be put in full commission as early as practicable to take care of the increased enlistments which will be called for by increased personnel provided in the present bill.

FRANKLIN D. ROOSEVELT,
Assistant Secretary of the Navy.

VICTOR BLUE,
Chief of Bureau of Navigation.

D. W. TAYLOR,
Chief of Bureau of Construction and Repair.

H. R. STANFORD,
Chief of Bureau of Yards and Docks.

J. S. MCKEAN,
Captain, United States Navy, Assistant for Material.

That was followed by a memorandum of January 14, 1916 [reading]:

JANUARY 14, 1916.

Memorandum for Chief of Naval Operations.
Subject: Development of navy yard plans.

Mission—to make plans for the development of the various necessary navy yards to their full capacity and greatest efficiency at the least cost of time and money, so that they may be adequate for the use of the fleet in preparation for war and its maintenance in war.

That was our gospel in reference to maintenance and material, in reference to yards [reading]:

The necessary steps in the order of execution for the above are:

1. *A base plan.*—To be developed by the General Board showing all the naval bases necessary in war; the various duties of each of these bases to the fleet; what part of the fleet is to be based thereon; the functions of each arranged in the order of their importance.

2. *An ideal navy yard plan.*—This to be a complete general plan of an ideal navy yard, such as could and should be developed on a new site which had no limitations as to area, depth of water, currents, lack of railroad or other necessary facilities.

3. A general plan (lay-out) of each yard showing its individual best development, giving consideration first to the use of the yard as ordered in the approved base plan, and second to the approved ideal standard plan provided under paragraph 2.

(a) After the approval of the general plan of any yard the sequence of its development should be determined by stages which should be so selected that each stage would be complete in itself and could properly be provided for in the annual appropriation bill. There should be given stages to correspond to the approved building pro-

plan, so that the yards, with all their facilities, would keep step with the growth and development of the fleet and all should be completed by the time the approved building program is completed.

4. *Detailed plans of each yard.* -After the general plan for a yard, with the layout of water front, docks, dry docks, shops, and transportation facilities, has been approved by the department, a set of detailed plans for each dry dock, shop, storehouse, railroad track, etc., should be worked out, with all the specifications for their construction with bills of material and new machines, and complete and detailed estimates of the costs involved. This set of plans should be grouped under the various annual "stages of development" decided on in accordance with paragraph 3, subhead (a), and each stage should be included in the annual estimate for the year to which it belongs.

5. After the development of the detailed plans and their division and classification into logical and complete annual stages, the department will at any time have at hand exact plans and estimates necessary to complete the development of the yard up to its limit of availability in the maintenance of the fleet in war.

6. To carry out the above scheme it is recommended:

a. That the General Board be called upon to submit at the earliest date practicable the base plan called for in paragraph 1. This plan to show in detail all the activities of each yard arranged in the order of their importance, and classified under two headings: (1) Activities in preparation for war; (2) activities during war.

b. That the base plan under (a) when approved by the department be referred to a board to consist of one representative from each of the following bureaus: Navigation, Yards and Docks, Construction and Repair, Steam Engineering, Supplies and Accounts, Ordnance, Medicine and Surgery and a representative of the Major General Commandant, with the assistant for material as chairman, whose duty it will be to provide the ideal or standard navy yard plan and general plans of development layout of each yard. The above board would be too numerous to be effective except as an executive board, so that it would be necessary to designate, as recommended in the letter of the Chief of the Bureau of Construction and Repair, a subboard or working committee consisting of the representatives of the Bureaus of Construction and Repair and Yards and Docks to do the actual work on development of the above plans ready to submit to the full board for final decision and approval. The above make certain that the necessities of no bureau have been overlooked or too much limited by the especial interest and appreciation of the activities of the bureaus represented by the working subboard.

c. On the approval by the department of the general plan for any yard, this general plan to be referred to the commandant of such yard, who will order a yard board to work out the detailed development in accordance with the approved general plan. This yard board will list the materials, new machines, cranes, locomotives, and various facilities needed; write the detailed specifications and make the itemized estimates to fulfill the detailed plans. When the above is completed it will be forwarded to the department board, which, if it meets their approval, will submit it to the department, and when approved by the department these detailed plans, specifications, and estimates will become a part of the approved base plans and be included in the portfolio of base plans covering this particular navy yard and will constitute a continuing policy on which the various bureaus will base their annual estimates for such yard.

J. S. McKean.

That is the navy yard development board. That is still working. It started at that time, and taking the most important yards, one at a time, we worked out the details for their development, what it would cost, and then we asked for the items to be put in the estimates each year, and got the appropriations and applied them; and if we had not started something of that kind we would have been less ready, by far, than we were.

Then here is a communication to the Secretary of the Navy as to a base plan for development of navy yards. It gives the thought as to what a base plan should include, and it is very complete. I will put it in the record for the consideration of the committee.

They even assigned ships to home yards by classification, and it was all approved and adopted, and we were working on this fixed plan quite a little while before the war; long enough to establish the habit.

The communication is as follows:

[Ref. D.]

G. D. No. 404-A (Serial No. 480).

DEPARTMENT OF THE NAVY,
GENERAL BOARD,
Washington, March 4, 1916.

To: Secretary of the Navy.

Subject: Base plan for development of navy yards.

References: (a) Navy Department's letter No. 20857-6, of January 20, 1916; (b) G. B. No. 414-1, May 29, 1913, development of fuel depots; (c) G. B. No. 404, December 30, 1913, comment on reports of inspection of Atlantic coast navy yards; (d) G. B. No. 425, January 3, 1916, berthing facilities at navy yards; (e) G. B. No. 404, January 12, 1916, new sites for naval stations at New York and San Francisco Bay; (f) Bureau of Supplies and Accounts; report on preparedness quarter ending December 31, 1915, Exhibit No. 4.

Inclosure: (a) Base plan.

1. The General Board believes that a base plan to be of value in the immediate future should contemplate the use to their greatest capacity of all Government and commercial facilities now available which are required to prepare the fleet for war in accordance with mobilization plans already approved by the department (14 days), and maintain this fleet during war.

2. The immediate development of Government facilities should be to meet these requirements, on lines best adapted to develop ideal conditions in the future, while not diminishing any of the present needed facilities until the ideal has been attained.

3. The navy yards of the country have grown up to meet the needs arising from time to time and their location and equipment is not such as would be now provided if the problem was one to be solved from the beginning at the present time. The consequence is that there is much duplication, stations are established close together, and there is a diffusion of effort, and consequent increase of overhead cost. Economy of administration demands as few naval stations as practicable to accomplish necessary results. This is the theoretical consideration, but the practical consideration which must govern at the present time and probably for some years to come, is that in time of war all the naval facilities that the country possesses will be needed.

4. Before proceeding with the development of the details of such a base plan, the General Board will, in order to avoid a confusion of terms, define certain terms which are used in the plan:

(a) A naval base is generically a center from which a fleet can operate and be maintained.

(b) Permanent naval bases are the fixed naval bases of the country; their numbers, location and character are questions of policy and grand strategy.

(c) Permanent naval bases divide themselves naturally into two classes: Home bases and outlying bases.

(d) Home bases are themselves divided into two classes, main and subsidiary.

(e) A main home base is a base within the continental territory of the country from which the fleet can operate at all times, and which is designed to maintain, supply, and upkeep the fleet at all times, both in peace and war. The base, in this sense, consists not only of the port harbor or estuary from which the fleet may act, but of all the territory and resources tributary to this port or harbor; and must contain all the elements necessary to the maintenance and upkeep of the fleet and for its own defense. A city, harbor, or a navy yard or arsenal in itself in no sense, singly or collectively, constitutes a naval base, though all are elements of such a base. If to a harbor giving sufficient anchorage we add a city or population giving a sufficient supply of labor, a navy yard or arsenal with the requisite docks, shops, etc., giving a sufficient means for repair and upkeep, a tributary territory with efficient means of communication furnishing the requisite supply and resources, and all behind a defense independent of the fleet, then we have a main naval home base.

(f) A subsidiary base is a base that contains elements of a main base in lesser degree; and which, while not capable of supporting and being the home of the whole fleet, may be such for lesser elements and portions of it.

(g) An outlying permanent naval base is one without the continental limits of the country, situated in outlying possessions and designed to be a strong point of support, from which the fleet can operate in war and from which it can be subsisted for limited periods in war.

(h) A navy yard is a docking, repair, and supply station and is always a necessary part of a permanent naval base, but it does not and can not of itself constitute a naval base of any kind, though so generally confused with one.

(i) Advanced bases are outlying naval bases of a temporary character; their location and strength being decided by questions of the immediate strategy and tactics of the campaign requiring them.

5. The General Board submits herewith inclosure A, a base plan in accordance with the foregoing, showing the present assignment and future development recommended.

6. The assignment of ships to home yards by squadrons, divisions, etc., has been considered, but the General Board believes that owing to the present divided navy yard facilities the assignment can be best made at the present time by name (as is now done in G. O. No. 137), on the advice of the technical bureaus as to the present facilities of navy yards, on the following general lines:

- (a) Largest ships to New York yard.
- (b) Next largest ships to Norfolk yard.
- (c) Next largest ships to Boston yard.
- (d) Next largest ships and all ships in reserve to Philadelphia yard.
- (e) Large cruisers to Portsmouth yard.
- (f) Largest vessels on Pacific coast to Puget Sound yard.
- (g) Supply ships to New York yard as far as practicable.
- (h) Colliers to Norfolk yard as far as practicable.
- (i) Oil fuel ships and transports to Philadelphia yard.
- (j) Small cruisers, destroyers, fleet submarines, fleet tugs, and auxiliaries not mentioned above according to yard best fitted at present to look after these vessels in addition to those assigned above.
- (k) Coast patrol ships to yard in or nearest district to which these ships are assigned in war.

7. In reviewing the reports of inspection of merchant vessels the General Board will recommend that repairs and alterations to merchant vessels required for war be undertaken at commercial yards (building or repair yard of ship when practicable) under the supervision of navy-yard authorities in that base, and to be made by such navy yard itself if facilities permit at the time.

8. The items of naval material to be manufactured at any navy yard or commercial articles supplied from any base should be decided by the particular facilities of the yard and market, according to the recommendation of the bureaus concerned as indicated in reference (f).

9. The General Board does not believe that an entire outfit of supplies should be carried at any base for all the ships based at that yard, as some stores will always be on board, and the amount carried should be the probable amount required to complete outfits (Title B, Title X, Provisions and clothing) for six months, as shown by experience.

10. For further detailed recommendations as to future development of navy yards, stations and fuel depots, attention is invited to references (b), (c), (d), and (e), the principles of which are summarized in the following:

- (a) The establishment and development to completion of four great naval home bases, two on the Atlantic and two on the Pacific coast.
- (b) That these four bases shall be at New York, the lower Chesapeake, Puget Sound, and San Francisco Bay.
- (c) That, for naval control in war over the western North Atlantic (including the Caribbean Sea and Gulf of Mexico) and northern Pacific, there shall be established two naval outlying bases, which shall be developed into permanent naval bases (arsenals) capable of self-defense against major attack by a strong enemy.
- (d) That these two bases shall be Guantanamo and Pearl Harbor.
- (e) The Isthmus of Panama may be considered as practically a naval base; for all Government facilities such as drydocks, repair shops, fuel, and other supplies will always be available to the Navy, but no regular naval station need be established there. The question of establishing an outlying base at Guam is left in abeyance pending the disposition of the Philippines.
- (f) That Philadelphia be continued as a subsidiary base, and developed as the principal ship construction navy yard.
- (g) That Key West be continued and developed as a subsidiary base for torpedo craft.
- (h) That Pensacola be continued as a subsidiary base and developed as an aircraft training and experimental station.
- (i) That for the time being, until the two great home bases on the Atlantic coast are developed to the point of maintaining the whole fleet, the naval stations at Boston, Portsmouth, and Charleston be continued as subsidiary bases.
- (j) That all other naval bases, navy yards, and naval stations be continued until such time as the development of the four main home bases and two outlying permanent bases, prove that any of these subsidiary bases, or stations, are no longer needed for the maintenance of the fleet in peace and war.

ROE DEWEY.

[First indorsement.]

AUGUST 28, 1916.

From: Secretary of the Navy.

To: General Board.

Subject: Base plan for development of navy yards.

1. The base plan for the development of navy yards, submitted by the General Board with its letter 404-A (serial No. 480), of March 4, 1916, is approved, except that in the respect of the designation and development of the outlying permanent repair and supply base in the Caribbean, the department's decision will, for the present, be deferred.

W. S. BENSON, *Acting*.

[Second indorsement.]

SEPTEMBER 6, 1916.

From: Secretary General Board.

To: Secretary of the Navy.

Subject: Base plan for development of navy yards.

Returned, by direction of the General Board; contents of the preceding indorsement noted.

H. J. ZIEGEMEIER.

The next is dated June 21, 1916, from the board for the development of navy-yard plans to the Navy Department. I put that in as an illustration of the way that the Navy Yard Development Board made studies and estimates. This communication is as follows:

NAVY DEPARTMENT,
Washington, D. C., June 21, 1916.

From: Board for the development of navy-yard plans.

To: The Navy Department.

Subject: Development of Norfolk.

References: (a) Joint letter of Naval Operations, Bureaus of C. and R. and Y. and D., April 29, 1916, C. and R. No. 7352-a-43-F.

(b) Report of Roosevelt Board dated October 12, 1915.

Inclosures: (a) Blue print showing land areas and tentative allotment of space.

(b) Chart showing site in relation to Hampton Roads.

1. It is considered of great importance that the development of the Norfolk Navy Yard should be undertaken at the earliest possible time, and in submitting the following recommendations the board considers that provision has been made for the commencement of the most important elements of its development along lines which will be consistent with the final arrangement of the station as a main naval base.

2. The recommendation contained in the joint letter of the Chief of Operations and the Bureaus of Construction and Repair and Yards and Docks, contained in reference (a), is concurred in, as well as the report of the Roosevelt Board, reference (b).

3. In view of the recommendations contained in reference (b), the board has considered the question of the removal of the training station to the property on Hampton Roads known as the Jamestown Exposition Grounds. Careful investigation of the subject points to the necessity of a naval base at Hampton Roads adequate not only for the training station but for the following activities as well:

- (a) Fuel-oil storage.
- (b) Fleet stores, mines and mine sweeping stores and equipment.
- (c) Primary submarine base for the fifth naval district.
- (d) Fuel supply.
- (e) Berthing facilities for both large and small ships, for receiving and discharging fuel and stores.
- (f) Fleet drill, camp and recreation grounds.
- (g) Mobilization camp and drill grounds for Marine Corps Expeditionary Forces.
- (h) Primary aviation base and training camp for fifth naval district.

Inclosures (a) and (b) show the proposed site of such a naval base with a tentative distribution of grounds for the above activities, and indicates the various extensions which could be obtained by filling in the flats around the shore line.

Nine large piers are shown fronting on the dredged channel to Norfolk, where coal for the fleet in lighters could be secured and from which supplies, fuel oil, etc., could be delivered direct to the fleet, these piers being of sufficient size to accommodate the largest vessels of the Navy. Ample room on the hard ground inside the shore line is available for underground fuel-oil tanks, storage houses for fleet stores, and barracks for submarine crews.

The ground allotted to the training station is slightly greater than that at the Great Lakes Training Station and should be ample for the accommodation of 5,000 or more apprentices.

The board is informed that many of the buildings now on this property can be adapted to Government use. The board is also informed that the waters of Willoughby Bay are very suitable for aviation training. Hangars can be stationed along the present shore line and the buildings already erected on the plat in yellow assigned to aviation can be used for the accommodation of the personnel. By filling in the extension of 212 acres a level tract of ground can be obtained entirely bare of trees or other obstructions and suitable for airship sheds, aeroplanes, etc., necessary to a well-equipped aviation base for the fifth naval district.

Estimates received from the Fidelity Land & Investment Corporation of Norfolk, Va., place a value on this property as follows:

| | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| All buildings and grounds north of Ninety-ninth Street and east of Maryland Avenue..... | \$923, 187 |
| Pine Grove section north of One hundred and fourth Street and west of Maryland Avenue..... | 45, 000 |
| Deep-water pier, extending to the westward from Pine Grove..... | 10, 000 |
| Block of land bounded by Maryland Avenue, One hundred and fourth Street, Virginia Avenue, and One hundred and second Street..... | 78, 500 |
| Pine Beach Hotel property and riparian rights to the westward..... | 190, 000 |
| Property bounded by One hundred and first Street, Maryland Avenue, One hundred and second Street, and Maryland Circle..... | 42, 500 |
| Block No. 44, to the westward of Maryland Circle, and riparian rights to the westward..... | 67, 500 |
| Blocks No. 55, 56, 57, and 58..... | 115, 000 |
| Virginia Railway & Power Co. property between One hundred and first Street on the north, boundary line in red to the southward, and to the westward of blocks 56 and 57, including riparian rights..... | 20, 000 |
| Total..... | 1, 491, 687 |

4. The naval bill now under consideration includes the two most important items, namely, a new dry dock and structural shops. The additional projects which should be provided for at this session of Congress are as follows:

| | Authorized cost. | Appropriation, 1917. |
|----------------------------------------------|------------------|----------------------|
| Water-front improvements..... | \$3, 300, 000 | \$2, 250, 000 |
| Building ways for large ships..... | 600, 000 | 600, 000 |
| Purchase land for training station, etc..... | 1, 500, 000 | 1, 500, 000 |

5. The board, therefore, recommends that the following items be inserted in the naval appropriation bill as reported to Senate June 8, 1916, under Public Works, Bureau of Yards and Docks.

Page 22, line 20, insert after the semicolon the following items:

Water-front improvements (limit of cost, \$3,300,000), \$2,250,000.

Building ways for large ships, \$600,000.

"That the Secretary of the Navy is hereby authorized to acquire by gift, purchase, or condemnation such site or sites in the vicinity of Hampton Roads, Va., as shall in his judgment be deemed necessary or expedient for naval purposes, and the sum of \$1,500,000, or so much thereof as may be necessary, is hereby appropriated for said purposes: *Provided*, That any unexpended balance of said appropriation may be used toward improving the site or sites so acquired."

I next present a memorandum dated March 30, 1917, which covers the bases. This is submitted with the purpose of showing that the material end of Operations, which as set forth, included the coordination of bureaus with the yards and fleet to maintain the fleet in war was at work. We were working along consistent, well-considered plans, and we knew what we wanted, we knew what we wanted to do with it, and we did it as fast as Congress gave us the money.

The CHAIRMAN. What war plans?

Admiral McKEAN. These are both. They are peace plans, fundamental plans necessary to get the fleet ready for war and to maintain it in war.

The CHAIRMAN. Were not most of these things that were in these plans also desirable in peace?

Admiral McLEAN. Absolutely necessary. This was peace, so far as we were concerned as a nation. But as I stated yesterday, Mr. Chairman, navy yards had grown rather haphazard. It depended largely on the commandant, for instance, his forcefulness and far-sightedness in planning yards. And then, if he got in touch with a good, strong Congressman in that district, or with a Senator who would back him up, they could come down here to Congress and talk their navy yard and get away with it; but when you came to consider the whole fleet and its preparation in peace and maintenance in war, it was largely a matter of luck. You understand that just as well as I do. The yards grew. One would get a start and then the next one would get a start. But there was not any system about it.

The CHAIRMAN. This was a comprehensive plan to cover all the yards?

Admiral McKEAN. Yes; based on the military needs and not on local interests or desires. What the fleet needed is what we were trying to get.

Senator TRAMMELL. They were necessary in peace and more necessary in time of war, were they not?

Admiral McKEAN. Absolutely necessary at both times; and we did not ask for anything that was not necessary.

This last communication is as follows:

NAVY DEPARTMENT.
Washington, March 30, 1917.

Memorandum.

Subject: Special estimates for appropriations.

DESTROYER TENDERS.

1. There are building and in service the following destroyer tenders: In service, *Panther*, *Dixie*, and *Melville*; authorized, 2; total provided for, 5. Allowing one tender for each flotilla of 18 destroyers, the authorized program shows a shortage of 11 tenders. Assuming that 50 additional destroyers may be authorized under emergency programs we would have a total of 176 destroyers, which would require 10 tenders. Therefore this emergency program should provide for the construction of at least two destroyer tenders. The cost of the *Melville* was \$1,310,000, and adding 10 per cent for increased cost due to increased cost of material and labor and rush work, makes the present cost \$1,441,000 per unit; and for the five additional tenders required, \$7,205,000.

SUBMARINE TENDERS.

2. All submarines now in commission are based on tenders and no other vessels are available for this duty. A submarine base at New London, sufficient to accommodate 20 submarines has been appropriated for. A submarine base accommodating 20 submarines will cost not to exceed \$1,500,000. A submarine tender to accommodate 6 submarines will cost \$1,000,000. The maintenance cost of the base for 20 boats would be about \$100,000 while that of a tender for 6 boats is \$195,000 per year. It is expected that the sundry civil bill will provide for a submarine base of 20 units at Coco Solo, Colon Harbor. Under present conditions and without hastening the building program it will be necessary to provide tenders for at least 11 submarines; in 1918 for at least 14 more; in 1919 at least 30. All fleet submarines require tenders. The navy yard commission recommends a large training base at Los Angeles and an advance base for submarines attached to the aviation base at San Diego.

Owing to the inadequacy of the present navy yards and their shop facilities to care for submarines, the fact that their presence at a yard repairing other ships is undesirable, that all navy-yard fronts have a very limited water front, and that experience has shown that submarines in the ordinary yard are very liable to damage by the movement of other ships, the flotilla commander has earnestly recommended that a

submarine repair station for all the submarines on the Atlantic coast be established at Philadelphia, where there can be provided adequate water front, fresh-water storage, with sufficient room for special shops, storehouses for batteries and torpedoes, barracks for crews, etc. This to the west of the causeway in the back channel.

Having in view the recommendations of the General Board, the flotilla commander, navy yard commission's recommendations, and the department's previous decisions, the following will be needed:

West coast:

| | |
|--------------------------------------------------------------------------------------------------------------------------|---------------|
| 3 main bases (exclusive of land)..... | \$3, 000, 000 |
| 2 tenders (6 boats each) | 2, 000, 000 |
| Atlantic coast: 3 main bases (1 to be a repair base at Philadelphia, with a capacity for caring for 20 submarines) | 3, 000, 000 |
| Pearl Harbor: 1 main base..... | 1, 000, 000 |

AVIATION.

3. There is now available and unallotted \$4,453,487.79. Of this sum \$750,000 is intended for station at San Diego, and \$500,000 at Pearl Harbor, leaving balance of \$3,203,487.79.

The following is a detailed estimate for expenditure under aviation to April 1, 1918:

New aircraft:

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| 326 seaplanes..... | \$3, 912, 000. 00 |
| 54 dirigibles..... | 2, 160, 000. 00 |
| 16 kite balloons..... | 64, 000. 00 |
| 13 airplanes..... | 204, 000. 00 |
| 4 free balloons..... | 12, 000. 00 |
| 1 experimental rigid airship (one-half of cost)..... | 750, 000. 00 |
| Total..... | 7, 102, 000. 00 |
| Spare parts..... | 2, 000, 000. 00 |
| Coastal stations: 11 coastal stations, including land, construction, preparation, and equipment (except aircraft)—Maine coast, Provincetown, Block Island vicinity, New York, Cape May, Hampton, Key West, West Indies, Galveston vicinity, San Francisco vicinity, Puget Sound vicinity, \$300,000 per station..... | 3, 300, 000. 00 |
| Establishment of school at North Island, including land, construction, and equipment (except aircraft) additional to \$750,000 already appropriated..... | 250, 000. 00 |
| Establishment of station on exposition site for fleet aviation base, and experimental and development purposes, including construction, preparation, land, and equipment (except aircraft)..... | 1, 000, 000. 00 |
| Establishment of permanent station at Pearl Harbor, including land, construction, and equipment (except aircraft), additional to \$500,000 already appropriated..... | 250, 000. 00 |
| Maintenance and operation of all stations..... | 2, 500, 000. 00 |
| Total..... | 16, 402, 000. 00 |
| Available..... | 3, 203, 487. 79 |
| Required..... | 13, 198, 512. 21 |

The following paragraph is submitted for incorporation in the emergency naval appropriation bill:

“Aviation: For aviation, to be expended under the direction of the Secretary of the Navy for procuring, producing, constructing, operating, preserving, storing, and handling aircraft and appurtenances; construction, equipment, maintenance of aircraft stations, and experimental work in development of aviation for naval purposes, \$13,198,512.21: *Provided*, That the sum to be paid out of this appropriation under the direction of the Secretary of the Navy for drafting, clerical, inspection, and messenger service shall not exceed \$100,000: *Provided further*, That the Secretary of the Navy is hereby authorized to acquire by purchase, lease, donation, or by condemnation, such land sites in the United States or any of its possessions as are immediately necessary for the establishment of school, experimental, and coastal air stations, the cost of such land not to exceed \$2,000,000 and to be paid from this appropriation.”

FLEET OPERATING BASE.

4. Demands on Norfolk Navy Yard and Training Station are making more and more urgent daily the establishment of a complete operating base for the fleet in the immediate vicinity of Hampton Roads. Such a base will relieve the yard of a large number of activities that now occupy space but valuable water front,

valuable areas and storehouses, and will permit the proper development and utilization of all these for their primary use—the repair and building of ships. The yard can not now properly care for the repairs allotted to it, and when the building of capital ships, as planned, is undertaken the necessity for the removal of these secondary activities from the yard will be imperative.

The fleet will of necessity be based on Hampton Roads and the lower Chesapeake a large part of the time, both in peace and war, and the Norfolk Navy Yard will be the primary repair base on the Atlantic.

The proposed operating base, located on the only available satisfactory site, i. e., the so-called Jamestown Exposition ground, extended to deep water on a 35-foot channel leading to Norfolk, should provide for the following activities:

FLEET OPERATING BASE (ACTIVITIES).

1. Training station for 8,000 men.
2. Submarine base for 20 submarines.
3. Aviation operating base for a double coastal unit and for the operation of Zeppelins when we have produced this type.
4. Coal piers, for berthing coal barges loaded and awaiting fleet's demands.
5. Oil fuel storage, for oil fuel, gas oil, gasoline and lubricating oil for fleet use, with piers piped for discharging cargo for fueling battleships, destroyers, submarines, and barges.
6. Fleet storehouses, to accommodate all fleet stores ready for delivery and thus permit the very limited navy yard storehouses and space to be used for the storage of yard material exclusively and avoid the expense and unnecessary rehandling of fleet stores in and out of the yard and yard storehouses, and at the same time avoid the now unavoidable delay in the delivery of such stores to the fleet.
7. Mine and net storehouses: There will of necessity be a large number of mines and nets used in the defense of the Chesapeake. These should be of course stowed somewhere in this region. The most convenient and accessible place would be at this place, where piers, tracks, cars, men, etc., would be available for handling this heavy and bulky material.
8. Torpedo storehouses: To store the spare and reserve torpedoes for the fleet in very large numbers, the storage of which and room for their proper handling and care will require a large storehouse located near deep water, with piers available for vessels to lie alongside when taking on board torpedoes or turning them in for overhaul.
9. Medical storehouse: A storehouse capable of storing sufficient hospital equipment and hospital stores to completely equip an advance base hospital, at least one hospital transport, and in addition a large reserve of these supplies for the fleet and hospital ships.
10. Recreation and drill grounds for men of the fleet, with athletic fields for all sports, swimming pool, clubhouse, etc., etc., a crying need that the fleet has recognized for years. This same field would serve admirably for a fleet drill ground for shore drills and as a mobilization camp for marines or other troops who are to be transported overseas on transports convoyed by the fleet. The piers provided for would permit of the transports coming alongside, being loaded and unloaded, and taking or discharging their men directly to this field. The space allotted for the above purposes would accommodate 10,000 troops.

| | |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| The whole site referred to above can be purchased for the sum of | \$1, 300, 000 |
| The training station can be equipped for its purposes at an additional cost of | 1, 000, 000 |
| Submarine base, with barracks, shops and equipment | 1, 250, 000 |
| Aviation operating base, grounds therefor, barracks, shops, etc., equipped for double unit | 1, 000, 000 |
| Coal piers, 10, ultimately needed, including necessary grading, dredging, etc. (which would incidentally provide an extension for the plotted area) | 5, 000, 000 |
| Oil-fuel storage, piping of piers, etc | 500, 000 |
| Fleet storehouse (at least 1 double unit) | 800, 000 |
| Mine and net storehouses | 100, 000 |
| Torpedo storehouses | 100, 000 |
| Medical storehouse | 250, 000 |
| Recreation and drill grounds (grading and preparation of grounds, swimming pool, clubhouse, etc., all of which utilities would be available for the regular use of the training station, as well as for the fleet) | 500, 000 |
| Total cost of completed fleet operating base | 11, 800, 000 |

This sum, \$11,800,000, could not all be utilized immediately, but there should be appropriated and made available until expended not less than \$6,000,000.

General summary.

| | |
|-------------------------------|-------------------|
| trooper tenders..... | \$7, 205, 000. 00 |

The next is a letter, which I have marked "I," from the Secretary of the Navy to the commander in chief of the Atlantic Fleet. [adding:]

I.

FOR POLICY FILES.

[Third indorsement.]

NAVY DEPARTMENT, *October 4, 1915.*

Commander in chief Atlantic Fleet, via Board of Inspection and Survey.
 Subject: Inspection methods; proposed augmenting of board and classification of repairs: battleship inspections.

The department concurs in the recommendations contained in paragraph 1 of commander in chief's letter as amended by paragraphs 4 and 5 of the first indorsement—that is, the fleet officers become members, but do not vote—this with the idea that the Board of Inspection and Survey is the department's agents and must be independent of both the fleet and the yards.

For the reasons stated above, the department concurs in the recommendation that the president of the Board of Inspection and Survey as to changes in articles 4305, 4306, and 4309, Naval Instructions, changing the word "augmented" to "assisted," and that the representatives of the navy yards become members but have no vote.

It is directed that hereafter the commander in chief be notified by the president of the board and the opportunity given for the detail of such officers of the fleet as may be available for duty in connection with the inspection as recommended in paragraph 3 of the first indorsement.

We were trying to revise and improve the inspection methods by adding to the board of inspection from the Navy Department certain officers from the fleet who, through familiarity with the conditions when the ships were at sea and in the fleet and matters came up there, could immediately give the Board of Inspection and Survey information in regard thereto, and call their attention to defects, so that well-considered recommendations came to them when the board met there; so that we put these officers from the fleet on the board to keep the fleet's advice constantly before the department, so that we would not get to be purely theoretical, and so that the bureaus of shore command or yards would not control the fleet's needs; and while it looks like a matter of rather minor importance, it is not. Paragraph 4, continuing, is as follows:

Referring to paragraph 2, the department's view is that the repairs on board ships come under three headings rather than two:

First. Those that can be done by the ship's force.

Second. Those that can be done within the fleet, with the assistance of the repair ships.

Third. Those that can only be done at a navy yard. It is the department's view that all repairs of the first class should be kept up to date and that the ship should be given opportunity for such repairs and the commanding officer should be held responsible for their being cared for; that repairs of class 2 should be brought to the attention of the commander in chief by the commanding officer of the vessel concerned, according to regulations established in the fleet, and that opportunity for repairs that can only be done by the repair ship would be afforded by the commander in chief. The Board of Inspection and Survey would then properly have only those repairs which could not be done by the fleet or the ship's force, but by a navy yard. This, of course, does not include certain work on underwater body, etc., that can only be done by the ship's force when the ship is in dock.)

5. With the above procedure in view, the department adopted the policy announced of having a ship sent to the yard and inspected in sufficient time before her repairs would take place, to permit the yard to assemble all materials and make the necessary plans for the repairs; and when this preparation had been completed, the commander in chief to be informed and he to direct the vessel concerned to be at the navy yard on the date set.

Then, here is another one [continuing reading]:

6. Should the Board of Inspection and Survey find work that they consider belongs to the ship's force or should properly be done by the repair ship, there would be an opportunity for this work to be done between the time of inspection and the return of the ship to the yard for navy yard repairs.

A commanding officer is kept up to his job through the inspection of his division commander. The repair ship is in the force commander's hands, or in the commander in chief's hands, and if the Board of Inspection and Survey says there is a job that could and should be done by the repair ship, that is up to the commander in chief. This is all for the purpose of relieving the yards of unnecessary work. [Continuing reading:]

7. The above is not to be understood as in any way reducing the assistance which the ship's force should lend the yard (within the limits of the law) while navy yard repairs are being made.

JOSEPHUS DANIELS.

Next is a memorandum, "J," dated October 5, 1916, from myself to the Chief of Operations. [Reading:]

J.

OCTOBER 5, 1916.

Memorandum.

For: Chief of Naval Operations.

Subject: Inability of the navy yards as at present developed and organized, and with their present forces, to maintain the fleet in the proper condition of readiness for war.

1. I have, through my experience at the material desk in Operations, become convinced of the following:

(a) Our navy yards are not properly developed and equipped as to shops in general, foundries, storehouses, power plants, and transportation facilities, to properly care for the fleet as it was a year ago, much less as it is now and will be in the immediate future.

(b) It is my belief that the present variety of organizations for administrative purposes, for manufacture and repairs, and for yard maintenance are too varied (to insure a proper standard) for the department to efficiently administer them or for the fleet to understand them.

Then I make recommendations as to how to correct the above conditions. There is a question of navy-yard organization. I have very distinct views on that, which I have stated in that paper. That memorandum was submitted and, in general, approved. The organization of the yards was not changed, and has not been yet.

The CHAIRMAN. That was signed by you?

Admiral McKEAN. That was signed by me; addressed to the Chief of Naval Operations.

The CHAIRMAN. Where these memoranda are not signed, I think it would be well to put the name on, possibly.

Admiral McKEAN. Yes, sir. Whenever they are material, and I read them as a memorandum to the Chief of Naval Operations, that means that I signed them.

The CHAIRMAN. Any memorandum to the Chief of Naval Operations not signed is signed by you?

Admiral McKEAN. Yes; I forwarded it to my chief or took it in person.

The CHAIRMAN. Very well.

Admiral McKEAN (continuing reading):

2. To correct the above conditions, which to-day unquestionably exist as shown the futile efforts of the department to arrange for the completion of the required ~~work~~ and alterations in the fleet within a reasonable time and the necessity it has ~~been~~ under of accepting repeated postponements of repairs and alterations necessary put the fleet in efficient fighting condition, the following departmental actions ~~will~~ be taken at once:

a. Give the Board on Navy Yard Development the necessary drafting force, clerical ~~work~~, and the relief of certain members from other duties, to permit that board to ~~work~~ as rapidly as possible in the development of plans for the rehabilitation and ~~fixing~~ up of the material side of the present navy yards to fit them to meet the ~~present~~ demands.

b. Develop immediately a standard navy-yard organization.

c. That the necessary officers to efficiently administer the above recommended ~~organization~~ be ordered to the navy yards to undertake the work which those yards ~~will~~ do. This to include the administrative officers, superintending officers, that ~~heads~~ of the department subdivisions with their necessary subordinates and an ~~equivalent~~ number of inspectors to insure the yard work being done in the best way, the least cost, and in the least time. (This on the principle that self-inspection is delusion.)

d. That the yards be directed to immediately recommend methods of increasing the ~~present~~ available force of mechanics, laborers, etc., of all classes. Whether this be by ~~increase~~ of wages, the establishment of apprentice or training systems to train boys the various trades, a system of using the enlisted men, or whatever method they ~~may~~ suggest. The above is recommended because it is and has been apparent for ~~some~~ time that the repair forces in the navy yards are utterly inadequate to take care the fleet's work; that the wages paid on the outside are hardly practicable for Gov-
ernment work; that outside firms are now training numbers of boys and young men the trades and that the Government is not doing its share in the training of skilled ~~labor~~ to meet the present and probably future shipbuilding demands of our country.

3. The several remedies in the order of importance and briefly stated are:

(a) Expansion of number of employees beginning with the drafting force.

(b) Expansion and proper equipment of the yard plants beginning with increased ~~storage~~ space to provide for present stores and the necessary large increase of reserve ~~stores~~. After this, power plants, dry docks, additional piers, etc.

(c) Reorganization.

(d) A section of the Board of Inspection and Survey, who shall, on orders from the department, visit yards whose output is unsatisfactory from either the department's or the fleet's point of view, make the necessary investigations and recommendations ~~into~~ remedies to the department. This is a necessity to produce the highest efficiency, and will increase the general efficiency of the yards in the same way and to the same extent that inspections have increased the efficiency of ships, and for the same reasons.

McKEAN.

The next is a communication of October 13, 1917. [Reading:]

[Second Indorsement]

NAVY DEPARTMENT, *October 13, 1917.*

b. Bureau of Construction and Repair.

subject: Submarine construction, Portsmouth, N. H.

1. Returned, contents noted.

2. The recommendation in paragraph 3 of the first indorsement is approved in ~~no~~ ~~as~~ and only so far as it applies to submarine No. 107.

That belongs really to submarines, and it is brought in here to show the policy. Submarine No. 107 was a fleet type of submarine that Admiral Grant told the committee about. There were two built by each of the submarine companies, and one built by the Government. This No. 107 was the one built by the Government, and we were very anxious to get that type of boat, each of the three, out, so that we could test them, make comparative tests, and so on, to determine which was the best, and which parts of which were

better, and then from that data to get out a standardized type of fleet submarine. [Continuing reading:]

As the department has previously stated, the primary function of navy yards is the repair and maintenance of the fleet in commission. All building activities and manufacturing activities, except in emergency cases such as submarine 107, which will be indicated by the department, must give way to the repair and maintenance of the vessels of the active fleet.

3. The recommendations contained in paragraph 4, first indorsement, are approved.
JOSEPHUS DANIELS.

Copies: All bureaus, all yards, C. in. C. (fleet).

There was where we had to keep pressure on the yards. They like to work on new work, the men like to work on new work. They can see their progress there and the yard can see it. Everybody is anxious for it. They hate a repair job, because it is never done and they are doing the same thing every day. But the importance of the navy yard to the fleet is in repairs. Private yards can do the building.

Here is another policy letter dated October 22, 1915, as to vessels of doubtful military value. [Reading:]

L.

POLICY.

OCTOBER 22, 1915.

Circular letter.

To: Commandants of all navy yards and naval stations, and to all bureaus.
Subject: Vessels of doubtful military value, procedure in authorizing urgent repairs.
Reference: (a) Article I-4335 (a).

1. The following addition will be made to reference (a):

"When requests for urgent repairs are received from vessels whose condition is such as makes it doubtful whether they are worth the expenditures necessary to make complete repairs, the commandant, before authorizing any work, shall immediately notify the department of the amount of work desired by such vessel, and request an inspection of the vessel by the Board of Inspection and Survey. No work will be undertaken without specific authority of the department."

JOSEPHUS DANIELS.

That was to save spending money on useless stuff.

Here is another communication, dated October 23, 1915, from the Secretary of the Navy, on the subject of opportunity for the overhaul of machinery. Here was the urge put up to the commander in chief. [Reading:]

M.

POLICY.

NAVY DEPARTMENT,
Washington, October 23, 1915.

To: Commander in Chief, Atlantic Fleet; Commander in Chief, Pacific Fleet; Commander in Chief, Asiatic Fleet.
Subject: Opportunity for overhaul of machinery.

1. The following recommendation has been made by the Bureau of Steam Engineering:

"The bureau desires to invite attention to the numerous comments on the Report of Engineering Competition, 1914-15, relating to the matter of adequate time and opportunity for overhaul of machinery during times vessels are away from navy yards. If overhaul periods at navy yards are to be reduced, considerable progress in this direction can be made by affording better opportunities for doing overhaul work by the ship's force. In this connection it is emphasized that an occasional period of several weeks will be of much more value than double or treble this time divided up into many periods of a few days' duration.

"It is suggested that this matter be called to the attention of commanders in chief and others in authority who may determine or direct the readiness of vessels for service. A proper consideration of this matter will, in the opinion of the bureau, result in great improvement in upkeep, reduction in repairs, and actual availability of vessels' machinery for continued service."

2. It is directed that the above recommendations be carefully borne in mind and that the work of the fleets be so laid out as to permit suitable time for the upkeep of machinery.

JOSEPHUS DAVIS.

There is an illustration of trying to accomplish something by indirection. I had quoted that so often that I was afraid they would get a little bit impatient, so that I got one of the bureaus to start the ball rolling and to put it through the commanders of the fleets. I was going to sea later on, I hoped, and I was afraid that I would not get a very warm reception if I kept disturbing their peace of mind too much.

The next is "N." dated December 3, 1915, in relation to vessels in reserve. This refers to the painful conditions shown by Admiral Fullam. I am going to refer to the admiral's letter in the statement; but the admiral's complaints were just, and to show that we had tried to do our part, he gave material credit for a policy being established in 1917. I do not know whether the admiral found this letter on his files or not, but it was addressed to all bureaus and commanders in chief of fleets, to the commander of the reserve torpedo flotilla of the Atlantic Fleet, to the commandants of all navy yards and naval stations, to the office of target practice and the division of naval militia affairs. [Reading:]

N.

NAVY DEPARTMENT,
Washington, December 3, 1915.

To: Bureaus of Navigation, Construction and Repair, Steam Engineering, Ordnance, Supplies and Accounts, Medicine and Surgery, Commanders in Chief, Atlantic Fleet, Pacific Fleet, Asiatic Fleet, Atlantic Reserve Fleet, Pacific Reserve Fleet; commander, reserve torpedo flotilla, Atlantic Fleet; commandants of all navy yards and naval stations; office of target practice; and division of naval militia affairs.

Subject: Vessels in reserve.

1. The department announces the following policy relative to vessels in reserve:
2. The condition of all vessels in reserve commission shall be one of complete readiness in all matters of material and equipment to perform all their assigned duties in war as soon as their complements are filled.
3. When vessels are to be placed in reserve, all work necessary to put them in reserve condition shall at once be undertaken and pushed to completion.
4. The crews will be retained on board until the work incident to placing the vessels in reserve, required of the crews, shall have been performed.
5. All equipment for each ship shall be kept on board or in store and not diverted at any time for use on other ships.
6. In reducing the complements, great care will be exercised that the men selected for reserve crews shall include a sufficient number of trained petty officers and men to maintain alive the ship's organization and to insure that when strange men are added to fill the complements, the vessels will be ready for efficient service with the fleet after a short "shakedown."
7. Reserve crews will be expected to maintain the vessels constantly in efficient material condition and, as well, to exercise weekly at military drills.
8. Vessels in reserve should exercise underway at intervals, singly or in group, to demonstrate the preparedness of their machinery and mechanical devices.
9. Watch, quarter and station bills and detailed organization bills should be kept up to date and station bills be ready for issue.

That is the station for each man. When he goes aboard you will hand him his ticket and tell him where he eats and sleeps and where he works and what he does. [Continuing reading:]

10. Reserve torpedo vessels will be treated as other reserve vessels and will not cruise for long periods with the fleet. They will have periodic ascor-
maintain the preparedness of their machinery, and will hold sur pedo
practice and elementary gun practice as may be found pra e re-
quired of them.

better, and then from that data to get out a standardize fleet submarine. [Continuing reading:]

I am going to refer to the admiral's letter in the statement; but the admiral's complaints were just, and to show that we had tried to do our part, he gave material credit for a policy being established in 1917. I do not know whether the admiral found this letter on his files or not, but it was addressed to all bureaus and commanders in chief of fleets, to the commander of the reserve torpedo flotilla of the Atlantic Fleet, to the commandants of all navy yards and naval stations, to the office of target practice and the division of naval militia affairs. [Reading:]

N.

NAVY DEPARTMENT,
Washington, December 3, 1915.

To Bureaus of Navigation, Construction and Repair, Steam Engineering, Ordnance, Supplies and Accounts, Medicine and Surgery, Commanders in Chief, Atlantic Fleet, Pacific Fleet, Asiatic Fleet, Atlantic Reserve Fleet, Pacific Reserve Fleet; commander, reserve torpedo flotilla, Atlantic Fleet, commandants of all navy yards and naval stations, office of target practice; and division of naval militia affairs.

Subject: Vessels in reserve.

1. The department announces the following policy relative to vessels in reserve:
2. The condition of all vessels in reserve commission shall be one of complete readiness in all matters of material and equipment to perform all their assigned duties at war as soon as their complements are filled.
3. When vessels are to be placed in reserve, all work necessary to put them in reserve condition shall at once be undertaken and pushed to completion.
4. The crews will be retained on board until the work incident to placing the vessels in reserve, required of the crews, shall have been performed.
5. All equipment for each ship shall be kept on board or in store and not diverted at any time for use on other ships.
6. In reducing the complements, great care will be exercised that the men selected or reserve crews shall include a sufficient number of trained petty officers and men to maintain alive the ship's organization and to insure that when strange men are added to fill the complements, the vessels will be ready for efficient service with the fleet after a short "shakedown."
7. Reserve crews will be expected to maintain the vessels constantly in efficient material condition and, as well, to exercise weekly at military drills.
8. Vessels in reserve should exercise underway at intervals, singly or in group, to demonstrate the preparedness of their machinery and mechanical devices.
9. Watch, quarter and station bills and detailed organization bills should be kept up to date and station bills be ready for issue.

That is the station for each man. When he goes aboard you will find him his ticket and tell him where he eats and sleeps and where he works and what he does. [Continuing reading:]

10. Reserve torpedo vessels will be treated as other reserve vessels and will not cruise for long periods with the fleet. They will have periodic tests at sea to ascertain the preparedness of their machinery, and will hold such proving and torpedo practice and elementary gun practice as may be found practicable and may be required of them.

That was necessary. We have found flag officers wanting the whole bunch. They would forget that the vessels in reserve only had partial crews, and they would take them out and they would work the crews to death and would run the machinery to death. It was enthusiasm and ambitious effort on their part to train the crews, but they could not see the material. That was inside. [Continuing reading:]

11. Reserve crews of torpedo vessels will be expected to maintain their vessels in efficient military condition when treated in accordance with the foregoing plan. They can not maintain this condition when cruising extensively with the fleet without incurring excessive repair bills and requiring extended periods of overhaul, thereby withdrawing them from availability for immediate service.

As will be noted in the delay of getting destroyers, that was exactly what followed. We could not keep their hands off, and we had to use these vessels in neutrality duty. [Continuing reading:]

12. All ships in reserve shall be docked annually.

13. Reserve ships shall be held in readiness to participate in annual fleet maneuvers, and those carrying guns will hold some form of target practice annually. (This applies to reserve ships assigned to receiving-ship duty.)

14. Every vessel in reserve will be considered subject to be drafted into active service in the fleet to replace an active ship withdrawn.

That is, in case of emergency or breakdown we would take a sister ship that was in reserve and swap crews and send her out to take her place in the fleet as soon as we could. [Continuing reading:]

15. Provisions will be made by the Bureau of Navigation to fill the complement of all reserve ships from designated sources.

That is, the Naval Militia, Naval Reserves, or wherever her war complement came from. [Continuing reading:]

16. Ships loaned to Naval Militia and receiving ships (and all other vessels not attached to the active fleet) will be under the control of the commanders in chief of reserve fleets, who will from time to time inspect them to assure their being maintained in satisfactory condition.

JOSEPHUS DANIELS.

That is the policy, wholly and completely stated, of the vessels in reserve, and we did our best, with the material that we had, with the yards we had, with the personnel we had, from the material side, to carry it out.

Here is a memorandum dated February 3, 1917, on the subject of material, repairs, building. I think this was just about the time Mr. Bernstorff was invited to leave Washington.

The CHAIRMAN. This was your memorandum?

Admiral McKEAN. Yes, sir. [Reading:]

O.

NAVY DEPARTMENT,
Washington, February 3, 1917.

Memorandum for Chief of Naval Operations.
Subject: Material, repairs, building.

1. From a material point of view our mission under present conditions is:

(a) Prepare all ships now built for war service at once.

(b) Complete new ships as rapidly as possible.

2. There are a large number of ships now being built in our yards on foreign orders. There is a much greater number being built on home orders. The above calls for a large amount of material and employs a large number of ship mechanics. Our navy yards are short of men, material, and machines. Our next difficulty will be the transportation of material and machines.

3. To secure the above men, machines, and material will require legislation. It is suggested that this legislation should authorize the Navy Department to—

(1) (a) Work overtime. (b) Pay double wages for overtime. (c) Increase all wages in navy yards and at other Government plants at once.

That is because we had to compete with the shipbuilding plants and the Shipping Corporation. [Continuing reading:]

(2) (a) Stop all foreign delivery of vessels, materials, or machines needed by us in the Navy or in our own merchant marine, and to compel the firms having such contracts to center their efforts on vessels needed by us, their surplus material, men, and machines to be available for transfer to Government plants or to private plants doing Government work.

4. Have all yards and bureaus list all machines and material needed and give them authority to commandeer them when not employed on other equally important Government work.

We got a good many tools and a good many ships, and we got a good many thousand tons of steel by doing that very thing, but it took legislation to do it. [Continuing reading:]

5. Have all mechanics employed in navy yards or private yards or plants on Government work released from all military service and listed as Government Service Corps.

6. Authorize Government inspectors to compel all yards and plants to give Government orders for material, machines, or parts right of way over all other orders, foreign or domestic.

7. Give Government materials, munitions, mechanics, or troops right of way over all other kinds of freight, express, or passenger.

8. Procure any submarines built for foreign Governments now in the United States. Take over any contracts for foreign Governments for parts to be assembled outside of the United States.

We did that.

9. Make arrangements with the English Government for obtaining heavy shells from Hadfields, or procure the method of manufacture.

They had been more successful in producing armor-piercing projectiles after that time than we had, by some process unknown to us, and that is a suggestion to get quickly that ammunition, which our producers had failed to produce, or the quality that would pass test. [Continuing reading:]

10. Procure from the English and French Governments rights and plans of their best types of aeroplanes and aeroplane motors; also all information they may have in reference to the Zeppelin type of dirigible.

The committee has asked about why we did not have some information before the war—before we went into the war—and why we did not send expert agents over. We tried. The Allies were closed up, tight. They would not tell us anything; and the further it went along the worse it got. They were sore at our not getting in, and they had the attitude, "Well, if you play the game we will tell you the rules;" and they did not loosen up on information to us until we did get in. Then they gave us everything. You can not blame them much for playing clam before, and they certainly did it. [Continuing reading:]

11. Select and equip the necessary bases for the operation of coastal patrol with dirigibles and aeroplanes.

12. Urge immediately on Congress the necessity of immediate appropriation of funds for the equipment of submarine and aviation base at Coco Solo Point.

That was a plan we had for the naval protection of the Panama Canal at this end, and it was important, as that was one of the foci of shipping that, in submarine raid or surface raid, they might

think a good place to hit, and disjoint our shipping from one coast to the other, and we had the plans and the canal authorities had the labor, etc., and we could go ahead and do it. [Continuing reading:]

13. Secure appropriation of \$1,400,000 for the purchase of the Jamestown Exposition site and \$5,000,000 for its immediate development—

That was to give us an operating base at Hampton Roads, which we needed very badly to get the supplies and personnel out of the way of the repair work. That is where I came in on it, on the material side. What I was trying to do was, I was trying to throw these other activities out of the navy yards, so that we could use them to capacity for material, and maintenance of the fleet materially and while some of these questions are not material questions, the motive behind them was to get room to handle material. [Continuing reading:]

13. Secure appropriation of \$1,400,000 for the purchase of the Jamestown Exposition site and \$5,000,000 for its immediate development, i. e., the building of piers, storehouses, oil fuel storage, fleet facilities of all kinds, and the equipment of part of the grounds of the training station site and submarine base for the handling of a large number of recruits, the money to be made available at once. This would provide the necessary aeronautic base on Hampton Roads. It is not believed that the Army base will be satisfactory for naval operations.

14. Authorize the construction, purchase, lease or rental, including the purchase of land if necessary, of the facilities for the receipt, storage, inspection, and shipment of material and stores of all kinds; also coal and fuel oil.

15. Secure necessary legislation and appropriation to authorize the purchase of material, reserve stores, equipage, and plans previously recommended.

16. \$1,200,000 for complete equipment of submarine base, New London.

17. \$5,000,000, rental, sites, and equipment, coast patrol stations.

That was for aviation.

The CHAIRMAN. Admiral, what became of these memoranda of yours? Were they necessarily approved?

Admiral McKEAN. They were not always approved in toto; but, like other things, the suggestions came from different sources of what we should do to get ready for the war, and they were taken to the chief, the chief took them up or took them up with the Secretary; and I only cite those to show what we were thinking about and what we were trying to do, and I want to say that I succeeded in getting most of them done in time. We would take them up with the chief and we would discuss them in conference, some of them would be changed a bit, but we did get most of it through. And this is illustrative of the lines we were working along, and I did have the sympathetic support of my chief in this business and, within limits, also of the Secretary. He thought that I was a very extravagant individual, and so did Congress.

The CHAIRMAN. But no action was taken, necessarily, at once on these memoranda?

Admiral McKEAN. Well, if I did not get some action on a memorandum at that time, Senator, I followed it up pretty close.

The CHAIRMAN. Can you inform the committee when action was taken on these memorandums?

Admiral McKEAN. These things were appropriated for. For instance, we got Hampton Roads and we got Coco Solo and we got New London and we got the coastal bases.

The CHAIRMAN. How about A, "To buy all ships now built for war service at once"?

iral McKEAN. The precedents I will give you right away, in that paper.

CHAIRMAN. That may be, but they were not prepared.

iral McKEAN. They could not have been instantaneously, and I did not have been anything like as fast as we wanted it. They could not do it. I think the following memorandum will show. But these were the lines along which we were working, and the Department was sympathetically supporting us. It went through top to bottom. We had to push.

CHAIRMAN. Take suggestion No. 3 (reading):

Secure the above men, machines, and material will require legislation. It is desired that this legislation should authorize the Navy Department to:

(a) Work overtime; (b) pay double wages for overtime; (c) increase all wages in navy yards and at other Government plants at once, etc.

It was that legislation passed?

iral McKEAN. When war came it was done. We were authorized to work overtime.

CHAIRMAN. After war was declared?

iral McKEAN. Then we paid time and a half for overtime, as within our own capacity—

CHAIRMAN. You did not pay double wages for overtime?

iral McKEAN. No, sir; they did not. I am very glad they did not. They paid too much as it was.

It was recommended to "increase all wages in navy yards and at other Government plants at once." That was done by the wage board and the Assistant Secretary of the Navy in conference with the Wages Appraising Board, and the other interests tried to stabilize wages in standards, and they all got together on that.

The foreign delivery of vessels was stopped.

CHAIRMAN. What I am trying to find out, in general, is whether because memoranda were made through the Chief of Naval Operations, they were of necessity followed out according to the recommendations?

iral McKEAN. No, sir; never in toto.

CHAIRMAN. Of course the memorandum indicates activity on the part in trying to get some things.

iral McKEAN. I am sure that I have not a thing here that does not meet my chief's approval, and there is not a recommendation in a single paragraph there, that ultimately was not in some way or other adopted, I think.

CHAIRMAN. But not according to the recommendation in the memorandum?

iral McKEAN. Practically, yes.

CHAIRMAN. Oh, no. You recommended that they pay double for overtime instead of time and a half.

iral McKEAN. No, sir; there is a variance; but it was along the lines recommended in the memorandum. I am very glad, as I have said before, that they did not. I think that I was too enthusiastic.

CHAIRMAN. But the point is that because the memorandum recommended it, that does not mean that it of necessity was followed?

iral McKEAN. No, sir; it does not.

CHAIRMAN. That is what I wanted to get.

iral McKEAN. But in this particular one it was practically followed.

Senator TRAMMELL. Your main object was to pay increased wages to stimulate and encourage people to come to the navy yards?

Admiral McKEAN. Yes, sir.

Senator TRAMMELL. You were emphasizing that more than you meant to emphasize double wages, were you not?

Admiral McKEAN. Yes.

Senator TRAMMELL. If time and a half was sufficient, that was all you wanted?

Admiral McKEAN. Yes, sir.

The CHAIRMAN. I am talking about the memorandum as it existed as a fact, with the recommendations it stated; and the recommendations in the memorandum were not of necessity followed exactly as they were there?

Admiral McKEAN. Oh, no, sir; that took the approval of the Chief of Naval Operations first, before I could even present them to the Secretary; and then it took the Secretary's approval before we could get Congress to act; and then it took the approval of Congress before we could do it.

Here is a communication of May 15, 1917 [reading]:

P.

MAY 15, 1917.

GENTLEMEN: The Navy Department announces, for your information, and guidance, the following order of precedence of work involved in the preparation for war under its cognizance:

(1) Delivery of material to vessels completed and undergoing overhaul or authorized alterations.

(2) Repair work for vessels of the fleet.

(3) Arming merchantmen.

(4) Arming merchant auxiliaries.

(5) Submarine chasers.

(6) Destroyers.

(7) Scout cruisers.

(8) Aircraft and their equipment.

(9) Submarines (large and small).

(10) Battleships.

(11) Fuel ships.

(12) Destroyer tenders.

(13) Submarine tenders.

(14) Hospital ships.

(15) Ammunition ships.

(16) Repair ships.

(17) Transports.

(18) Gunboats.

(19) Battle cruisers.

Very truly, yours,

JOSEPHUS DANIELS,
Secretary of the Navy.

CHAIRMAN GENERAL MUNITIONS BOARD,
Munsey Building, Washington, D. C.

NOTE.—Similar letter was also addressed to the following: Chief of Naval Operations, Bureaus of Construction and Repair, Steam Engineering, Ordnance, Navigation, Supplies and Accounts, Medicine and Surgery, Yards and Docks, General Board, Commandant, Coast Guard Service, Council of National Defense, The Secretary of War, United States Shipping Board.

That priority list was changed from time to time as the situation developed.

Here is an estimate of the situation made about June 1—a memorandum. Other officers recommended certain things. This was the material side, for the Chief of Operations, and along the lines you spoke of. It was not accepted in toto, but we ultimately got to

plan suggested worked out, not exactly along the lines of the memorandum, but in effect. [Reading:]

Q.

(About June 1, 1917.)

THE RAPID BUILDING OF A LARGE FLOTILLA OF DESTROYERS.

1. From the general estimate of the situation the decision was reached to build as rapidly as possible:

(a) A large number of submarine chasers.

(b) A large number of destroyers.

That had already been done. That was a part of the decision. [Continuing reading:]

In carrying out the above plan the following steps have been taken:

(1) A large number of small craft have been and are being purchased for use in harbor patrol and out to the 50-fathom curve.

(2) A number of yachts are being taken over and equipped for coast patrols under the commandant of the coast patrol force.

(3) Some 340 submarine chasers have been contracted for. These craft are of wood, 110 feet long, 660 tons, and it is hoped that they will prove satisfactory sea-patrol boats.

They were the ones that we were putting the listening devices on and used for developing that, and there were some of those contracted for before we went into the war. We did not give the order to a private yard, because we did not want the plans, etc., to get out, but we did order some at the Norfolk Navy Yard before we declared war, and as soon as war was declared we had the plans complete and ordered them in large numbers for ourselves and for the French. [Continuing reading:]

(4) A small number of tugs and steam trawlers have been purchased or chartered for sweeping, etc.

(5) A number of the fleet destroyers and coastal torpedo boats have been assigned to the coastal patrol force.

(6) We have now under contract some 52 destroyers, which is about the capacity of the firms heretofore engaged in building destroyers, and this source of supply can of course be speeded up, but can not be counted on for a large additional number at any one time.

To meet the above conditions and our excessive demands at the present time, the following plan is suggested:

Build the required number, whatever it may be—say 200—on the assembling plan, viz., build the hulls in one place, boilers in another, engines in another, and "assemble" them at certain navy yards or private yards.

The plan would call for complete standardization of hulls, motive machinery, boilers, pumps, lighting systems, etc.

The department would select standards from the most successful practice and would make complete detailed plans, write complete detailed specifications for each component, make contracts with the various works best fitted to undertake quantity production of each part, viz.: one group to furnish all hulls (all duplicates); another all boilers (all duplicates); all turbines and reduction gears (all duplicates); all auxiliaries (each class to be exact duplicates); no changes or variations to be permitted, so that when parts reach assembly yards any and all will fit, contracts to be made on the basis of cost plus percentage of profit, all works to be run in two shifts of 10 hours, with time and one-half for overtime, etc.

The details of inspection, transportation, etc., would have to be worked out so that the whole business would be taken over by the people on the ground, and only questions on appeal to be taken up through the general inspector with the department.

The assembling could probably best be taken over by the navy yards with forces organized at each, so as to carry on the simultaneous assembly of a division (6) at a time.

It might, and probably would, be necessary for the Government to advance the necessary capital to expand certain already organized producers' plants to provide for maximum production.

It is believed that under the above plan the first division of destroyers could be turned out in six months from date of completion of organization and plans, and that after that each assembly yard could complete one division (6) per month, or through yards one complete flotilla per month.

In the meantime, every destroyer possible to spare should be sent to the other side, for from information received to date, the most effective answers to the submarine so far formed are:

- (a) Armed merchant ships to keep them submerged.
- (b) Submarine chasers—and the best chaser under all conditions is the destroyer

Here is a memorandum dated June 2, 1917, for the Secretary of the Navy, a confidential memorandum. [Reading:]

R.

Confidential.

NAVY DEPARTMENT,
BUREAU OF CONSTRUCTION AND REPAIR,
Washington, D. C., June 2, 1917.

Memorandum for the Secretary of the Navy.

In reference to the Secretary's memorandum of May 31, the following is a summary of important work under the bureau since the declaration of war. Some of this work was inaugurated prior to the declaration of war, and some is still in hand.

The usual routine work of the bureau has shown an enormous increase in volume. The amount of correspondence handled had increased about 100 per cent over a similar period the previous year. The expenditures under the bureau's current appropriation have likewise increased by about 100 per cent.

Before the declaration of war the bureau started the necessary arrangements for increasing its force to handle the increase in work. The force in the bureau in all branches is now 229, as against 143 a year ago. Further additional increases in this force must be made and arrangements with this end in view are now in hand. In the navy yards there has been an increase in force since January 1 from 25,000 to more than 32,000 men. Further increases in these forces also must be made.

Contracts have been placed for all the vessels authorized in the naval appropriation bill for the fiscal year 1918, with the exception of three battleships, one destroyer tender, and one submarine tender. In connection with the placing of these contracts there has been developed and perfected an entirely new method of payment, namely, on the basis of actual cost plus a percentage of profit. This has involved a complete reconsideration and revision of the department's usual forms of contracts and has required the establishment of completely new machinery for handling matters of procedure in payment under the new form of contract. Arrangements have also been made with various contractors for these and previous vessels to speed up construction. Arrangements have also been made with the manufacturers of certain varieties of materials, notably steel materials, for the earliest possible delivery of all necessary materials for the construction of these vessels.

In addition to the vessels authorized in the naval appropriation bill for the fiscal year 1918, additional contracts have been placed for the construction of 355 submarine chasers, 15 destroyers, 24 mine sweepers, and 2 seagoing tugs.

The bureau has performed its part of the work of placing in active commission practically all vessels on the Navy list.

The bureau has performed the proportion of work under its cognizance in connection with the enrollment of about 600 patrol vessels and the assignment of battery to about 250 of these. In addition, although no merchant auxiliaries have as yet been taken over by the Navy, the bureau has accomplished a large volume of work in connection with the examination of plans of merchant vessels and the preparation of plans for their conversion into naval auxiliaries in case such action becomes necessary.

The bureau has performed a proportion of the work under its cognizance in connection with the arming of about 80 American merchantmen, 11 British merchantmen, and 10 Russian merchant vessels.

In addition to the purchase of the necessary materials under its cognizance for the prosecution of the increased volume of current work at navy yards, the following special material purchases have been made.

(a) Special plans have been made, and consultations are still in progress, in cooperation with the Bureau of Supplies and Accounts, and other bureaus of the department, in connection with the purchase of large quantities of materials which are desirable to carry in stock during times of emergency.

(b) The necessary schedules have been prepared and contracts placed for about 50,000 tons of structural steel for special purposes in navy yards.

(NOTE: This does not include structural steel purchased direct by ship constructors for incorporation in new vessels.)

c. Schedules have been prepared and contracts placed for a large amount of auxiliary machinery and special appliances for stock purposes so as to be ready to meet emergencies.

d. In cooperation with the Bureau of Forestry, and the Lumber Committee of the Union Board, an investigation of large scope has been carried on with regard to the immediate and future lumber requirements of the Navy.

e. Large purchases have been made of mattresses, hammocks, clothes bags, and other equipment, to keep abreast of the constantly increasing enlisted personnel.

f. A satisfactory type of gas mask has been designed, and manufacturing facilities for the same have been developed and contracts have been placed for 50,000.

g. A type of rescue breathing apparatus which can be produced commercially in large quantities has been developed, and all arrangements completed for placing large orders for such apparatus.

h. The necessary manufacturing facilities have been developed and contracts placed for 5,000 sets of Very's night signal apparatus.

The designs and specifications for new vessels as referred to under previous paragraphs have been developed and completed. Work is still progressing on other designs. In addition a very large amount of special design work has been carried on in connection with special schemes and proposals. Suggestions from many sources as to matters in connection with the prosecution of the war are received in large numbers. The careful and intelligent consideration of these requires an enormous amount of careful investigation and thought by highly qualified technical employees. In addition, the bureau is continuing in increased volume its usual program of experimental work, especially in the model tank, and in connection with the development of protection of the stability and buoyancy of ships from torpedo attack, both for vessels of the Navy and the merchant marine.

In aeronautics the bureau has prepared specifications for 100 sea planes, and has placed contracts for 90 of these. In cooperation with the builders, designs and specifications have been developed for small dirigibles, and contracts for 16 of these have been placed. The necessary arrangements have been made for placing orders for 24 additional dirigibles of this type as soon as the necessary information has been obtained from the trials of the first ones. There have been prepared and are now practically ready for issue, complete designs and specifications for new type of small seaplane, suitable for use aboard ship. There has been developed, in conjunction with the manufacturers, the design of small kite balloons, suitable for use on board ship. In conjunction with joint Army and Navy Airship Board, there is being prepared preliminary designs and estimates for a large rigid dirigible, and when approved by the department arrangements will be made for its construction, and it will probably be completed at an early date.

In connection with the special appropriations in the last two naval bills, totaling \$18,000,000, the bureau has, in conjunction with the other bureaus involved, completed plans for the development of the Puget Sound, Norfolk, and Philadelphia Navy Yards. The necessary investigations have been made for the allotment of this sum between these and the other navy yards. The actual work in this connection has been started for the yards. Arrangements have been completed after much difficulty for the purchase and equipping of the machine tools necessary for the contemplated development of the various yards. In order to provide the increase in working force as referred to above, and for the probable further increases in these forces, large purchases of small tools, other equipment, etc., have already been made, and orders placed for additional quantities in order to obviate any possibility of delay from shortage of such equipment. The necessary forces at navy yards and arrangements are in hand to still further increase these forces in order to keep abreast of the increased number of workmen and the increased amount of work handled by the yards.

In special reference to work undertaken under the emergency fund of \$115,000,000, carried in the appropriation bill of March 3, 1917, the bureau's letters, No. 13516 A106 of May 31 and No. 16660 A 1 of June 1, contained complete statement of the obligations under the cognizance of this bureau against that fund. Briefly, the work in and under that fund is as follows.

Three hundred and fifty-five submarine chasers, 15 torpedo boat destroyers, 2 sea-going tugs, 24 sea-going mine sweepers, aircraft, and Very's night signal sets, also the measures taken with various ship contractors for expediting work on contracts on hand form an obligation against this fund estimated at a minimum of \$20,000,000.

D. W. TAYLOR.

Here is another confidential memorandum for the Secretary dated June 2, 1917. This begins:

In compliance with your memorandum of May 31, 1917, I submit the following summary of the work in the office of Naval Operations since the declaration of war.

It gives different things. They both of them have been referred to here at different times. It shows the organization of the different forces and their distribution. It shows the organization and the development of the districts, and the work that they had done up to that time. I want to call attention particularly to this:

Repair work on battleships left unfinished before the movement of the fleet south has been taken up and practically all naval vessels have been made materially ready and put in service.

That is June 7, 1917.

Also under the heading of aeronautics, here is the following:

Contracts were authorized for such aircraft as could be turned out for the Navy by July 1, including in this number 16 coastal dirigibles, and contracts are being made for additional aircraft as fast as they can be accepted by the manufacturers. Two hundred and eight (208) aircraft have been ordered but not yet delivered. There are under construction at Pensacola 12 temporary hangars, a dirigible shed, and a large hydrogen plant.

There is a very significant thing that I will refer to again in the memorandum on aeronautics. It was not because of the lack of desire or intent or appreciation on the part of the Navy Department that we did not have a complete air force, completely trained and complete in material and every respect. You did not have the manufacturers; you did not have the plants to produce it; you could not get it, it did not make any difference how much money you had. We were behind. We had ordered from everybody that gave us even a fair promise.

I happened to have aeronautics wished off on me for a time, and it was a strenuous time, and I worked with every man that had a feasible practicable idea. I would get an engineering and building and construction plan, and if they could produce drawings, plans, or anything that even gave us promise of success, we would give them an order for three machines, because we wanted to find out for sure whether there was anything in it, and we wanted to develop a new source of supply. We would give a man an order for three machines or engines in order to cover his expenses of development and work. His first one would cost him five times as much, and we would obligate the Government for three of them, and let him take the other two.

The CHAIRMAN. This was during the early period of the war?

Admiral McKEAN. Yes; during and before. I took over aviation about the 1st of March, 1917; but they had been going on the same way under my predecessor.

The CHAIRMAN. This has nothing to do with the recommendation that was made in 1913, has it?

Admiral McKEAN. No, sir; but I will explain that when I take up the regular subject of that.

The CHAIRMAN. All right.

Admiral McKEAN. But that shows what Operations had done, and that is an illustration; and they had spent \$7,900,000 in the districts, taking over patrol vessels, and so on. Those vessels had to be

inspected and evaluated by boards, and their spending \$8,000,000 in that time on these little craft shows that they were pretty busy.

The CHAIRMAN. Did you say, "in the district"?

Admiral McKEAN. No; in the districts; in all the districts. They were mostly in the third and—

The CHAIRMAN. I thought you said, "the district."

Admiral McKEAN. No; in all the districts.

The memorandum last referred to is as follows:

S.

Confidential.

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, June 2, 1917.

Memorandum for the Secretary of the Navy.

In compliance with your memorandum of May 31, 1917, I submit the following summary of the work in the office of Naval Operations since the declaration of war.

OPERATIONS.

On April 1 all naval vessels were mobilized and immediate steps taken to fit them for war service as fast as their crews for full commissioning could be supplied. All naval districts were mobilized and their skeleton organizations are being filled as rapidly as personnel becomes available.

The Coast Guard, transferred to the Navy, have been operated by the Navy Department and all vessels belonging to that service have been repaired and refitted.

German refugee ships have been seized in cooperation with the Treasury Department, and the interned German vessels have been taken over for naval service and are being rapidly put in shape for active service. Refugee German vessels in Samoa, Honolulu, and Porto Rico are being towed to the United States for overhaul and fitting out for service.

There has been organized and put in operation a patrol force with the Atlantic Fleet, under the command of Capt. H. B. Wilson, which patrols the offshore waters of the Atlantic and Gulf coasts from Eastport, Me., to the Rio Grande. Suitable vessels of this force are held in readiness to operate against enemy raiders that may be reported in the North Atlantic.

There has been established in European waters a destroyer force under the command of Vice Admiral W. S. Sims, and 28 destroyers have been dispatched abroad for this service, together with two destroyer tenders. Two supply ships, under destroyer escort, have been dispatched to France, carrying cargoes of much needed material for that country.

By agreement with the allied powers definite areas of patrol in the North Atlantic and off the east coast of Brazil have been taken over by the United States Navy and a scout force has been despatched to cover the area assigned our forces in the South Atlantic, under the command of Admiral W. B. Caperton.

There has been established in the Pacific a patrol of the Pacific coast, including Mexico and Central America as far south as Panama Canal, under Rear Admiral W. F. Fullam.

There has been organized a force of small craft designated for patrol service in waters adjacent to the coast of France, and Capt. W. B. Fletcher has been placed in command of the first contingent of this force, which will complete its fitting out in a few days and start for its field of operations.

There has been organized a system of convoy service under general charge of Rear Admiral Albert Gleaves, in readiness for the convoy of any troops which may be despatched to France.

In addition to the foregoing armed guards have been or are in process of being placed on all vessels, about 150 in number, plying between the United States and Europe, and the Atlantic Fleet has been given the duty of training the crews or the armed guards of merchantmen and transports.

The organization of the several forces, the regulations for convoy service, the instructions for the operation of merchant vessels supplied with armed guards, and war instructions for United States merchant vessels have all been prepared and issued by the Planning Section of the Office of Operations.

A board, of which Capt. Pratt of the Office of Operations, is chairman, has been appointed to consider plans and devices connected with submarine warfare, and is in almost daily session and conference with the research committee of the Council of National Defense.

Definite and effective steps have been taken toward the organization of machinery to take over the control of the routing of all merchant vessels leaving United States ports. At present this function is being exercised by representatives of the British Admiralty stationed in our ports.

Preparation and distribution of various publications and ciphers for use in communication between merchant vessels and men-of-war of the United States and of the allied powers is well advanced. The communication office has been greatly enlarged to meet the demands of the increased work brought about by the state of war, the taking over all radio service, and the establishment of the censorship over cables. It is contemplated to establish a service of officer-messengers for the distribution of secret orders, confidential publications, and ciphers.

NAVAL DISTRICTS.

The work of the naval districts has been extremely active, especially in districts 1 to 5, inclusive, because of their greater strategic importance and because of the great trans-Atlantic traffic passing to and from the ports within their limits. The sixth, seventh, and eighth naval districts are filling up their organization, but are not developed to the same extent. Those districts on the Pacific coast and in Hawaii have not yet been fully organized. Defensive sea areas have been declared and have been enforced in Boston, Newport, New York, Philadelphia, Cape Henry, Hampton Roads, and Charleston as fast as the number of patrol boats become available efficiently to enforce control over the areas. Other areas will be enforced as the organizations grow.

Six hundred and twelve small vessels have been inspected and found suitable for naval use. One hundred and fifty-two have been taken into the naval service and assigned to scout patrol service and as mine sweepers. One hundred and thirty-eight have been ordered taken over but have not yet been delivered. Those accepted are now actively at work patrolling and mine sweeping or are being fitted out as rapidly as possible for work. All the small craft acquired by the naval district commandants have been manned by enrollment of Naval Reserves within the districts, and the personnel by active employment are rapidly being trained and accustomed to the line of work which the defense of the district demands. Mine sweeping is being carried out at Boston, New York, Delaware Bay and in the Chesapeake.

The obligations under the emergency appropriation of \$115,000,000 incurred in equipping the naval districts is indicated in the attached table.

OPERATIONS ON SHORE.

The Naval Government of the Virgin Islands of the United States has been established under the governorship of Rear Admiral J. H. Oliver, and steps have been taken to supply at least a partial land defense of the islands by mounting eight 5-inch guns distributed between the Islands of St. Thomas and St. Croix. Steps have been taken having in view the establishment of quarantine services, medical research services, and agricultural services in the islands.

Affairs in the Island of Haiti, involving the peace of the Republic of Santo Domingo and Haiti, have progressed satisfactorily, and the authority of the established Governments of these Republics has been maintained. In the two Republics there are now forces of marines aggregating 2,000. In Santo Domingo a guardo nacional under the military governor and under the direction of United States marines has been formed and is undergoing a course of training while in the Island of Haiti and the gendarmerie is reported to be in a very efficient condition. A small coast guard service has been established in Haiti and vessels repaired in ports of the United States assigned to this service have recently been delivered under United States naval escort.

In addition, there have been employed in the disturbed districts of Cuba, caused by the recent revolution in that country, a varying force of marines for the protection of American interests there. There are at present about 450 marines maintained in the island. An information service throughout the island has been organized.

We have maintained constantly in Mexican ports and along the coast, a patrol by our vessels, giving especial interest to the port of Tampico in the vicinity of which are vast oil fields constituting a large and important source of the world's supply of oil. From two to four vessels have been maintained continuously at this port.

MATERIAL.

The vast work of equipping and repairing the fleet has brought upon our various navy yards and shore establishments demands which have taxed their utmost capacity. Not only has it been necessary to complete the overhaul and repairs of our regular

naval vessels, but repairs to the seized German merchant vessels, and the fitting out and equipping of ships taken over for service have multiplied the work required to be done.

Repair work on battleships left unfinished before the movement of the fleet south has been taken up and practically all naval vessels have been made materially ready and put in service. The fitting out of vessels for distant service is nearly completed, 15 German ships badly damaged by their crews before seizure by this Government are being fitted out for naval purposes and eight German ships are being repaired for the Shipping Board.

AERONAUTICS.

The naval aeronautics program was considerably accelerated upon the severance of diplomatic relations February 3, 1917, and the present program of naval aeronautic expansion may be considered to have begun on that date.

Enrollments in the Naval Reserve Flying Corps were begun under definite standards supplied to commandants of the various naval districts, and arrangements for accelerating the training of personnel at Pensacola and for establishing various other schools of training were made. There are five such schools now in operation.

Contracts were authorized for such aircraft as could be turned out for the Navy by July 1, including in this number 16 coastal dirigibles, and contracts are being made for additional aircraft as fast as they can be accepted by the manufacturers. Two hundred and eight aircraft have been ordered, but not yet delivered. There are under construction at Pensacola 12 temporary hangars, a dirigible shed, and a large hydrogen plant.

In accordance with the recommendation of the Joint Army and Navy Board on Aeronautic Cognizance, sites for coastal air stations were examined and selected, and complete plans for the development of such stations were drawn up. Money for the acquisition of these stations is not available, but is included in an appropriation now pending. One site, however, has been obtained through permission of the use of land from the City of New York, and the construction of an air station there is now under way.

An allotment for the emergency fund of \$3,000,000 was made to aeronautics. Of this sum \$1,025,000 has been obligated and the expenditure of a further sum for the purchase of aircraft equipment costing approximately \$1,244,000 has been authorized. The balance of approximately \$731,000 remains available.

W. S. BENSON.

EXPENDITURES FOR PATROL VESSELS, MINE SWEEPERS, ETC., IN NAVAL DISTRICT.

[Referred to in page 3.]

Vessels taken over:

| Sweepers..... | 3,064,260 |
| Vessels ordered taken over..... | 1,555,001 |
| Vessels taken over by special board..... | 1,475,500 |
| Total..... | 7,916,629 |

I have here a report from the Bureau of Yards and Docks which shows what they were doing in hospital buildings, Marine Corps, aviation stations, and miscellaneous yard improvements, ordnance plants, dry docks, storage facilities, etc., and what had been done between the declaration of war and the date of the report, June 4, 1917.

In this connection I wish to submit a table that is, I think, illuminating. This is on the work of the Bureau of Yards and Docks appropriations.

For yards and docks and shore stations their appropriation for 1916 was \$4,500,000; in 1917 it was \$11,000,000; in 1918—that is the fiscal year that I speak of—it was \$103,000,000; in 1919 it was \$119,000,000. That is their own appropriations.

In addition, they expended for building for other bureaus and from the allotments of other bureau's appropriations, in the fiscal year 1916 only \$42,000; in the year 1917, \$32,700,000; in the fiscal year 1918, \$77,000,000; and in the fiscal year 1919, \$17,000,000.

Now, there is a fair illustration of the activities and about their ratio of increase in the shore stations, bases, aviation stations, etc., the material and land activities.

(The memorandum last referred to, together with the table referred to, are here printed in full in the record as follows:)

T.

NAVY DEPARTMENT,
BUREAU OF YARDS AND DOCKS,
Washington, D. C., June 4, 1917.

Confidential.

From: Bureau of Yards and Docks.

To: Secretary of the Navy.

Subject: Work in progress under the bureau and its activities since the declaration of war.

Reference: Department's letter of May 31, 1917.

1. The following statement describes briefly the work of the bureau:

SHIPBUILDING.

Covered by \$18,000,000 appropriation and specific appropriation of \$1,000,000 for a structural shop at Norfolk, Va., making a total of \$19,000,000. Work under Bureau of Yards and Docks approximates \$16,000,000, distributed as follows:

Portsmouth, N. H.: \$350,000. All work is now under way mainly by yard labor. Yard will be equipped to build submarines with seven boats on ways at one time.

Boston, Mass.: \$50,000. This includes only work of a minor nature practically completed.

New York, N. Y.: \$2,500,000. This includes new ways for new type battleship and a new structural shop. Contract for part of the work has been let. Completion of project dependent on the transfer of storage facilities to new building now under construction. Extension machine shop specific appropriation \$400,000 nearly ready for advertisement.

Philadelphia, Pa.: \$5,500,000. This includes ways for the construction of one battle cruiser and one battleship. It includes new structural shop, new foundry, new machine shop, fitting out pier, 350 feet long-ton fitting-out crane, new power plant, two building ships with overhead crane runways, galvanizing plant, together with the necessary distributing circuits, road, pavements, etc. Yard has now one small ways.

Contracts have been let for all shops and part of the power plant equipment; also crane runways and building slips. Plans for the power plant building, fitting out pier, and fitting out crane are nearly completed. The remainder of the power plant equipment is either under advertisement or will be advertised shortly.

Norfolk, Va.: \$5,225,000 including \$1,000,000 specific appropriation for structural shop. When completed there will be provided one ways for the construction of a battle cruiser. At the present time the yard has a destroyer ways.

This includes a new structural shop, foundry, machine shop, new power plant, shipbuilding, slip with overhead crane runway, fitting out slip, together with the necessary power distributing systems, railroad tracks, streets, pavements, sewers, etc. The structural shop is nearly completed, contracts having been awarded for the machine shop, foundry, building slip and crane runway, and for part of the power plant equipment. Accessory work is under way by yard labor and is progressing satisfactorily. Plans and specifications for the water front improvement, power plant building, additional power plant equipment, and other accessories, are well advanced and will be advertised or contracted for shortly.

Charleston, S. C.: \$400,000. With the torpedo destroyer ways which were constructed previously at the yard, the expenditure of this money will provide for 4 ways for destroyers, so that 4 vessels can be laid down at one time. The work includes, besides the 3 additional destroyer ways, a pattern shop, extension to the existing machine shop, public works building, a machinist mates' school to release space now occupied by same in machine shop, and miscellaneous distributing lines, railroad tracks, streets, etc. More than half of this work is now under active construction by the yard, plans for the remainder being practically complete and work will be started or contracted for by the yard shortly. Cranes for the additional shipbuilding ways have been placed under contract.

Mare Island, Calif.: \$500,000. The department has just authorized the expenditure of this amount at the Mare Island yard, which will include the extending and widen-

of the present slip to take care of the new type battleship, and minor changes and extensions to existing structures, additional railroad tracks, and street work, and the slipping of the machine-shop extension, which was provided for from funds of last year. This machine shop is under contract, and construction work is actively under way.

Puget Sound, Wash.: \$1,500,000. This will provide ways for the construction of a battleship and one scout cruiser. The construction of the building slip is under advertisement, contract for the shipbuilding cranes has been entered into. The remainder of the work to be carried out includes extensions to existing buildings, remodeling buildings, additional distributing systems, railroad tracks, paving, etc. The majority of this work will be undertaken by the yard, and in most cases work has either been started or is about to commence.

Improvements to central power plants and distributing systems: The appropriation for the fiscal year of 1918 provides approximately \$2,400,000 for power plants for various yards and stations. In addition to this the urgent deficiency bill will provide \$750,000 more. Approximately \$850,000 from the \$18,000,000 appropriation will be devoted to the power plants at Philadelphia and Norfolk, making a total for power plant construction of approximately \$4,000,000.

The principal work is at Philadelphia, Norfolk, and Washington. At Philadelphia and Norfolk entire new power plants are being provided of large capacity to provide for the demand caused by the development of these yards. At the Washington yard the plant is being more than doubled to take care of the new gun shop and the additional facilities included in the expansion of the ordnance plant. The remainder of the funds will be expended in extending the power-plant facilities at the other yards to take care of the greatly increased activities on account of the development of these yards by reason of the war, and also in providing emergency connections to commercial points.

WORK FOR THE BUREAU OF MEDICINE AND SURGERY.

Work is under way for the Bureau of Medicine and Surgery on temporary hospitals and dispensaries and on permanent extensions to the supply depots at Mare Island and New York, aggregating \$2,700,000. All this construction is being defrayed by annual appropriations or from funds to be provided from the urgent deficiency bill.

Emergency-hospital construction: The work in progress contemplates the construction of temporary hospitals, with total capacity of 2,700 beds, at the following locations: Portsmouth, N. H.; Newport, R. I.; New York, N. Y.; Philadelphia, Pa.; Norfolk, Va.; Charleston, S. C.; Key West, Fla.; Pensacola, Fla.; New Orleans, La.; Great Lakes, Ill.; Mare Island, Calif.; and Puget Sound, Wash.

This temporary construction aggregates \$1,500,000. Two-thirds of this construction has already been awarded and is under construction. The remainder will be awarded under contract within 10 days to three weeks.

Extension of medical supply depots: The urgent deficiency will provide for permanent extension to the medical supply depots at Mare Island, Calif., and New York, N. Y., estimated to cost \$350,000. A sketch layout has been made and the work will be started as soon as the deficiency bill passes.

Dispensaries, etc.: Buildings are under construction at Charleston, Newport, and Philadelphia. A sterilizing plant is being erected at Boston, and repairs and alterations are being made at various hospital reservations, together with a training school for hospital corps men at San Francisco. The value of the work is approximately \$1,000,000.

Contagious units: Contagious units are under construction at Newport, R. I., Portsmouth, N. H., Great Lakes, Ill., and Norfolk, Va., aggregating \$103,000. The work is well advanced.

SUBMARINE BASES.

New London, Conn.: \$1,250,000. This work is well under way and should be completed under contract within a few weeks. The general layout for the station has been decided upon. The work contemplates a complete base for training the personnel, as well as for basing approximately 10 boats.

Philadelphia, Pa.: Work has been started on a shop for overhauling batteries on submarines, which will include as a part of its equipment motor-generator sets for charging batteries.

Other bases: The urgent deficiency bill provides \$1,500,000 for equipping certain bases to charge submarines. The general requirements for the various yards have been worked out, and work will be in active prosecution soon after the deficiency bill passes.

AVIATION STATIONS.

Allotments have been made or requested from "Aviation" aggregating \$2,000,000. There is also being utilized for aviation development at Pensacola, an appropriation of \$420,000 for repairs on account of hurricanes, and also \$235,000 from "Engineering" for a hydrogen plant, making a total for aviation stations of approximately \$2,600,000. Work is being carried out mainly at Pensacola, for which approximately \$750,000 has been allotted, and at eight coastal stations.

Coastal stations: Eight of these stations are contemplated, but the sites for only two stations have been definitely determined. Contracts for the steelwork for the dirigible hangars have been entered into; also contracts for the erection of these hangars, providing of aeroplane hangars and miscellaneous other work for fitting up stations at two places—Rockaway Beach and Montauk Point. Plans are well under way for the other stations, and work will be proceeded with as soon as the locations are determined.

Pensacola, Fla.: The work at Pensacola includes a dirigible hangar, 9 permanent sea plane hangars, erection shop, 8 wooden hangars, bulkhead, dirigible shed, aeroplane piers and miscellaneous additional facilities. In addition to this, permanent piers for large vessels, additional power plant equipment, and general station improvements are being provided out of the \$420,000 appropriation to repair the hurricane damage. With the exception of the permanent pier, all projects are either under construction or have been recently contracted for.

In addition, a hydrogen gas plant, to be charged to "Engineering", and to cost \$235,000, has been contracted for and is well under way.

MARINE CORPS WORK.

Permanent construction: The work in hand for the Marine Corps approximates \$2,700,000. This includes \$200,000 in the urgent deficiency bill for additional storage facilities at the quartermaster's depot, Philadelphia. The major items include the following:

Peking, China: Barracks and miscellaneous equipment, \$60,000. Plans and specifications are ready for advertisement.

Philadelphia, Pa.: Additional barracks, advance base storage, and extension to clothing depot, approximately \$850,000. Preliminary plans for the barracks and clothing depot have been completed and the final plans are under way. Plans for the advance base storehouse are nearly ready for advertisement. The necessary steps are being taken to secure land for the Marine Corps depot in the city.

Miscellaneous minor work is in progress at Guam, Mare Island, Norfolk, Port Royal, Tutuila, and Winthrop.

San Diego: \$600,000 is available for construction of Marine Corps base. Test piles and borings are being taken on the proposed site and steps are under way toward purchase of the land and the securing of adjacent tidelands from the city. Active work on plans has not been started.

MISCELLANEOUS YARD IMPROVEMENTS.

Various improvements of more or less minor nature, aggregating \$3,000,000 are in progress at the various yards and stations. In general, the majority of this work is either under contract or advertisement. Major items are as follows:

Mare Island: Floating crane. Work on superstructure well advanced. Material for pontoon purchased and contract for fabrication about to be awarded.

Lighting facilities: \$200,000. This is applicable to all yards. In general, different amounts have been allotted and work is being proceeded with by yard labor.

Boston: Chain shop extension, \$60,000. This is under construction by yard labor.

Newport: Power plant, \$315,000. Plans and specifications have been started and early advertisement is expected. Seamen gunners' quarters and sea wall, \$140,000, under contract.

New Orleans: Extension of wharf, \$30,000, under construction by yard labor. Storage shed, \$40,000, under contract.

New York: Dredging, \$125,000, under contract.

Philadelphia: Fifty-ton locomotive crane, \$100,000, under contract.

TEMPORARY BARRACKS, MARINE CORPS.

Port Royal, S. C.: A contract has been awarded for temporary barracks at the Marine Corps Recruiting Depot at Port Royal, S. C., and this work is well advanced and in a great measure is completed.

Quantico, Va.: Construction has been started on a camp at this place to accommodate at least 10,000 men, and preliminary work is well advanced.

DRY DOCKS.

Two dry docks of maximum size are under construction at Philadelphia and Norfolk. These docks, when completed, will take the largest vessel which can go through the Panama Canal. Work on both dry docks is well under way and steps are being taken to secure their completion at the earliest possible date. Cost \$7,000,000.

WASHINGTON ORDNANCE PLANT.

A contract has been let and work is well under way for a gun shop of large capacity, to cost \$1,000,000; also shrinkage pit, \$250,000, power plant improvements described under power plant heading, \$770,000, and improvements and changes in existing shops amounting to \$212,000. All this work, with the exception of the two smaller shops, is under construction. Plans and specifications for the remaining jobs will be ready for advertisement shortly.

Studies are being made and report is nearly prepared covering permanent extensions to the Washington Navy Yard to provide increased facilities for the manufacture of torpedoes and other ordnance. This will include greatly increased storage facilities, a very large machine shop, extension to the foundry, optical shop, and other improvements which will probably aggregate \$4,000,000.

GENERAL STORAGE FACILITIES.

Permanent construction: For permanent structures \$3,523,000 has been allotted from the emergency fund, which with the \$1,000,000 provided for under specific appropriations, makes a total of approximately \$4,500,000. There are included in this program permanent storehouses for Boston, Philadelphia, Norfolk, Mare Island, Puget Sound, Charleston, New York, and also at New York a building for provisions and clothing. Construction work is well under way at New York on both projects and it is expected that they will be completed in the late fall. Contract for the work at Philadelphia has been awarded. The storehouse at Boston is under advertisement, and plans and specifications for the other work are nearly completed.

Temporary construction: Temporary and emergency storehouses, aggregating approximately \$400,000, are now being authorized out of the emergency appropriation. Work is under way at all stations where allotments have been made. The individual projects at each yard are in general under \$50,000.

ORDNANCE AMMUNITION STORAGE.

Approximately \$1,500,000 has been allotted from the emergency fund, the emergency deficiency bill contains \$3,000,000, and the appropriation act for the fiscal year of 1918 provides \$1,000,000, making a total available from all sources for these purposes \$5,500,000.

These projects are distributed between 16 stations. Minor projects amounting to approximately \$120,000 are now under construction by yard labor. This work is well underway, and in some cases has been completed.

At the present time work under contract or advertised amounts to nearly \$3,000,000. Standard plans and specifications have been prepared for the buildings to be provided for out of the remainder of the funds available. It is expected that all of this work will be advertised within three weeks. These structures provide storage for powder, shells, torpedoes, and mines.

WEIGHT HANDLING AND TRANSPORTATION FACILITIES.

There has been allotted from the emergency fund for this purpose approximately \$1,070,000. This amount is entirely obligated for equipment at the various yards and stations. A large part of this equipment has already been delivered and the remainder will be available shortly.

NAVAL ACADEMY IMPROVEMENTS.

The naval appropriation bill for the fiscal year of 1918 provides approximately \$2,500,000 for extension to Bancroft Hall and improvements to the power plant, and the urgent deficiency bill provides \$300,000 for extension to Isherwood Hall. Bids will be opened on Bancroft Hall and Isherwood Hall on the 1st of July. Part of the power plant equipment has already been contracted for and the remainder of the work is well in hand.

NAVAL INVESTIGATION.

PROJECTILE AND ARMOR PLANTS.

Work is progressing on the plans for the projectile plant, but very little has been done on the plans for the armor plant. Survey of the site is now in progress.

EXPERIMENTAL LABORATORIES.

No work has been done on this project.

JAMESTOWN PROJECT.

Tentative studies have been made of this project and it will be possible to start work as soon as funds are provided in the urgent deficiency bill.

TEMPORARY BARRACKS—NAVY.

It seems probable that the need for camps for training enlisted men of the Navy may easily aggregate over 50,000 men, requiring an expenditure of over \$7,000,000.

At the present time contracts have been let and construction is well under way, and in some cases nearly completed, for camps to accommodate approximately 5,000 men each, at Philadelphia, Charleston, S. C., Mare Island, and Puget Sound.

Great Lakes, Ill.: Work has already been started on a camp which may develop so as to accommodate 20,000 men. This particular location will require extensive equipment and structures to provide for water supply, sewage disposal, etc.

Newport, R. I.: Contract has been entered into and work is under way for housing 2,000 men; extensive developments of the stations to care for 10,000 men eventually are being developed and plans are well under way.

Pensacola, Fla.: Plans have been completed for camp of 1,000 men and contract will be made shortly. This camp is designed so as to be expanded to accommodate 2,000 men.

Miscellaneous: Tentative studies are in progress for possible additional camps at other places.

RADIO STATIONS FOR BUREAU OF STEAM ENGINEERING.

Radio work in progress aggregates \$600,000 and includes three 600-foot towers at Porto Rico, one 500-foot tower at Radio, Va., and one 200-foot tower at Norfolk, Va.

The work covers miscellaneous buildings for various radio stations located from Portland, Me., to Alaska, covering approximately 29 separate buildings. In addition, there are minor changes and improvements at the same stations.

Of the main projects the radio towers at Porto Rico, aggregating \$250,000, contract has been awarded. Plans are in preparation for the new towers at Radio, Va., and these will be out in a few weeks. Of the entire project, over two-thirds of the work is under active construction under contract, or advertised. The remaining work will be out within a month.

FUEL OIL INSTALLATION.

The work in progress under various appropriations including \$1,500,000 in deficiency bill for reserve fuel oil storage in Chesapeake Bay, aggregates \$3,500,000.

Contracts amounting to approximately \$400,000 have been entered into for work at Guantanamo.

Work at Melville, Puget Sound, San Diego, Mare Island, and Pearl Harbor, aggregating \$1,500,000, will be advertised within the next few weeks. The fuel oil reservoir at Pearl Harbor, aggregating \$100,000, is now under construction by yard labor.

PARSONS, Acting.

miral McKEAN. That finishes the policy lines and the reports of the separate subjects that have been referred to in the testimony of other witnesses, and I have tried to give data, tabulated, showing the actual figures covering in each case 1917, 1918, and 1919. First is the dreadnoughts.

The testimony of the commander in chief covers this question very completely, showing that the winter training in 1916-17 was more important than the immediate overhaul of these ships; that as conditions permitted and the necessity arose they were from time to time sent to the yards and put in condition and kept in condition for service.

able showing the repair period is attached; every time the ship is at a navy yard, the length of time she was there, and also the miles that each vessel steamed during each of these three years, as to her final condition and fitness to move, etc., is a pretty good guide.

The table last referred to is as follows:)

| vessel. | Days at navy yard for overhaul during— | | | Total miles steamed— | | |
|------------|--------------------------------------------------------------------|-----------------------------------------------------|------------------------------------------------------------|----------------------|----------|----------|

In this connection the attention of the committee is called to the shortage of dry docks at the beginning of the war; that the following docks have been added since that time: One 1,000-foot dock at Norfolk, Va., completed; two 650-foot docks at Norfolk, Va., completed; one 1,100-foot dock at Boston, purchased; one 1,100-foot dock at Philadelphia, building; one 1,100-foot dock at Pearl Harbor, completed; one 1,000-foot dock, private, San Francisco, completed—that is a private dock, and we obligated the Navy Department to use it each year up to the \$50,000, or hire it and pay them that amount of money each year, to get them to undertake it. So that we are five big docks better off and two small docks better off than we were before the war, and that was one of the greatest reasons of delay in providing ships. For instance, at one time at the New York yard we had the *Texas* in the big dock and the *Olympia* in another dock and a transport in another dock, all of them under repair to their bottoms, and we could not send any more ships to that yard; and even when we wanted to send ships to a yard we were up against the docking question first. The shortage of docks is our weakest point, both from a naval and commercial point of view. For maintaining the present fleet, and much more for the new additions to the fleet now building, we need a number of additional docks on both coasts.

The CHAIRMAN. We will need still more docks now?

Admiral McKEAN. Yes, sir; you do, on both coasts.

Now, as to the old battleships; that is, predreadnoughts or old battleships, referred to in Admiral Grant's testimony. In addition to the general statements of policy as to ships in reserve, and the older type of ships previously submitted to the committee, there is attached hereto a table showing the number of days at navy yards for overhaul of each of these 24 old battleships during the years 1917, 1918, and 1919. This table also shows the mileage steamed in each of these years, gives the date of assignment to transport duty and the date this duty was completed; and also number of troops carried by each of the ships. This table is submitted to show that, while these old ships varied in their date of building, from the *Indiana* in 1893 to the *Michigan*, first commissioned in 1910, where the oldest was 27 years old and the newest was 7 years from date of first commissioning when the war was commenced. Under "mileage steamed" it shows that, while old and out of date, they had been kept and were then in condition to do a large amount of cruising.

This data is to be taken in connection with the average under peace conditions, when, as I have found by previous investigations, each ship averaged one-third of her time in navy yards under repair, and the average cruising of a battleship in the fleet was about 10,000 miles per year. That was the normal peace cruising. Now, when you consider that under the rules of the game of most nations about one-half of these ships would have been junked and sold—scrapped—before we went into the war, they did pretty well. Here is 32,000 miles that the *Nebraska* steamed, for instance. The *Georgia* steamed 35,000 miles in 1919. And they carried troops, anywhere from 500 up to, on one trip that the *Virginia* made, 5,800. Their efficiency was fairly measured by their age and how long they had been in the reserve.

The *Indiana*, *Massachusetts*, and *Iowa* we have since expensed—that is, stricken them from the list—and there will be new ships named in their places.

here are numbers of others that in my opinion have no military use any more. But we had to do pretty nearly as much work on them. We would not do any alterations. We had to do more repairs relatively on old ships than on new; they cost us more for repair and more time and money at navy yards. But without those repairs we could not have trained the personnel we trained during the war at all; and Admiral Grant, in spite of his complaints about his ships, if he did not hammer the people and the material both to the very near their limit in training, I never saw it done. The table last referred to is here printed in full in the record as follows:)

Admiral McKEAN. The next subject is submarines.

Admiral Grant's testimony shows the details of the submarine situation before and during the early part of the war.

It shows that the department appreciated the situation and its unsatisfactory condition, and sent Admiral Grant to find out what the trouble was and to advise it, the department, how to correct it.

Admiral Grant saw all the difficulties and recommended various cures for the various troubles, in most cases calling for the scrapping of the engines in the boats on hand.

The CHAIRMAN. When was it that Admiral Grant was sent on this duty?

Admiral McKEAN. The spring of 1915, just before I went to Operations, I think. No, it must have been the latter part of May or June, because Admiral Benson went in as Chief of Operations here, and he took office on May 11.

There were no substitutes for the engines. The Bureau of Steam Engineering had sent officers abroad to study all types of foreign engines and was trying to secure and produce the best, with very poor success.

Our early types had gas engines that were pretty nearly suicide. They were trying to develop an internal-combustion type of engine based on the Diesel, but our people were not up to it. But they did send officers abroad and had them learning all they could. They were buying sample engines where they could, and it was a case of development, and we were behind, the same as we were in airplane engines later.

It was necessary that we use the old craft for training officers and men to man the new, so that all sorts of alterations and repairs were made from time to time in an effort to keep them operating.

That is, in the troubles that Admiral Grant had, he brought them to our attention and we did everything we could.

The navy yards were devoting a large amount of time, money, and labor to the subs, but we did not give up all of the navy-yard facilities to this class as Admiral Grant would have liked at that time, and as later, when his job had changed, and therefore his point of view, he wanted to put his whole battleship force No. 1, 24 ships, into the yard to the exclusion of everything else - even submarines. That was later, when his job changed. We compromised, as is usually necessary in meeting opposing demands.

The department had to consider all classes and their relative importance in the plans made to carry out our mission.

Each officer responsible for each of the jobs saw his job magnified relatively by its immediate proximity - some of them failed entirely to see the other jobs at all. Now, that is not a criticism. I would not give a hoot for a naval officer who did not think his job was the biggest one in the Navy. If he did not think that - except one higher up that he was working for - it was the biggest job around, and that he had the best division or the best ship, and so on, I would get another officer right away who did think that, because that is the only way. The man with the enthusiasm behind the job is the only one that gets the work out of it.

Had we listened only to Sims, and we did listen to him hardest, it would have been all destroyers. Had we listened only to Gleaves, it would have been cruisers and transports. Had we listened only

to Cone, the whole Navy and Navy Department would have been in the air. Had we listened to Fullam only, the navy yards and appropriations would have been devoted to his old armored cruisers. Had we listened to Grant only, it would all have been subs at one time and old battleships at another.

Admiral Grant was right in his demands for the larger sub, as the war proved. I took a compromise position in those hearings between Grant and what was the official, departmental, view. I was wrong; I believe that the department was wrong. The department's view was based on shore stations and the operation therefrom, more or less limiting the submarine to defensive uses. Our coast is such and the depth of water that the smaller submarine for purely defensive work is probably the more efficient. But Grant insisted that the larger would do the fleet work and could also do the inshore work. The department wanted to limit the larger ones to the development of a type and prove its efficiency before it gave large orders. Grant was willing to gamble on the big one right from the start.

The CHAIRMAN. So far as the future is concerned, you believe we should now build large submarines?

Admiral McKEAN. We have little ones enough to last us for a long time.

The CHAIRMAN. But we will need large ones?

Admiral McKEAN. We will need large ones. Admiral Grant analyzed the material difficulties, but even more important, trained the personnel, officers and men, so that they, in spite of the defective material he describes, succeeded in doing effective work against the enemy from December 1, 1917, to November 1, 1918.

I submit herewith a table in this connection, marked "X."

(The table referred to is here printed in full as follows:)

TABLE X.—Submarine division 5, performances from Dec. 1, 1917, to Nov. 1, 1918.

| | AL-1. | AL-2. | AL-3. | AL-4. | AL-9. | AL-10. | AL-11. |

¹ 3.78 gallons fuel to 1 gallon oil.

Admiral McKEAN. That trouble book or black book of Admiral Grant's I used to hate to see come into the office, because he had you nailed every time. He trained the personnel. That was the big one. He trained the officers and the men in a way that our submarine people had never been trained before. He got those people ready at that station in New London, out of his school, to take over the subs as they came in, and we had a good deal better submarine force

through Admiral Grant's tackling of submarine training than we could have had without it; but he used to make me very uncomfortable, frequently.

In my opinion, Admiral Grant is absolutely correct in stating that the fundamental cause of our submarine difficulties and failures is that we have permitted the contractors to dictate more or less completely our submarine design instead of doing the designing ourselves, developing standard types, proving them, and then having them built according to specifications drawn up by the department to meet the military use it proposes to make of them.

As you know, we have two companies that have patents, and their types originally were very different. As a matter of fact, all submarines look alike a good deal, now, and I think that we should have before this been doing our own designing. The fundamental reason we have not—and I think this same thing is true with regard to other things, with regard to many other desirable improvements of the same character—is that they will be impossible until the Congress gives the various bureaus much larger drafting forces here in Washington.

I think that is one of the most important material aids we can get. We now build ships the large-scale plans for which are made here in Washington. The plan is sent to a lot of contractors and builders, the navy yards, etc., and their designing and drafting forces work out all the details. Now, although they are sister ships absolutely, intended to do the same thing, when they come out they are twins, but one of them may be a blonde and the other a brunette, just the same, because the two designing forces have worked them out in a different way; and officers and men who are familiar with one can not go to another and handle her and her machinery as they should be able to do in duplicate ships. The only way I can see to get that is for the department to do its own complete designing, run off the blue prints and details, and send them to the contractors, and then you will get two ships that are duplicates, and not that just look alike; and your spare parts of one will fit the other. It will reduce the number of spares you have to keep in store; it will reduce the cost materially; but it will increase the number of people in Washington. But I believe it is real economy and real efficiency.

Now, to show that the submarine might have been worse, at least, Capt. Pratt submitted this performance of submarine division 5. I am perfectly willing to admit that that surprised me as much as it did you; but the personnel factor in submarines, like everything else, is a good 65 per cent anyhow, and with our personnel we had there, trained by Grant, they could make anything go.

The next subject is the German ships converted into Army transports. As the committee will recall, shortly after we entered the war we seized a number of German ships which had been interned in our ports. Among these were 16 large, fast passenger ships, commencing with the *Vaterland*, afterwards renamed the *Leviathan*. These ships were, at first, turned over to the Shipping Board, but early in July, 1917, 16 of them were, by Executive order, transferred to the Navy for equipment and operation as Army transports, and although the Hun had done his best, or worst, within his engineering ability, to disable these ships so that they could not possibly be made of any use to us during the war, they were each and every one completely repaired and the ' in commission with

months from the date they were turned over to the Navy. The engineering problems solved in overcoming the damage done by the Hun were solved by naval officers. The work was done either in navy yards or in private yards according to naval plans and under naval inspection and supervision, and these vessels were utilized from the beginning and until the last of our troops were returned in the transportation of soldiers and were a very large factor in the transportation to France of 2,000,000 soldiers and their safe return to their homes.

This particular case is cited because it was naturally an entirely unexpected job of repair work, entirely out of the usual line, and was, in addition to our own fleet, work whose demands upon our limited yard facilities were already excessive.

I submit herewith a table giving the name of the vessel, the date of transfer to the Navy Department, the date of completion of repairs, the date of the first sailing, and the date of the arrival in the United States on the last voyage, with the number of troops carried over, and the number of troops brought back.

(The table last referred to, together with attached memorandum, is here printed in full in the record, as follows:)

Y and 2-Y.

| Name of vessel. | Date of transfer to Navy Department. | Date of completion of repairs. ¹ | Date of first sailing. | Date of arrival in United States on last voyage. | Number of troops carried over. | Number of troops brought back |

¹ Vessel sailed on first voyage within a week from date of completion of repairs.

² Sunk July 1, 1918.

³ Sunk May 13, 1918.

MEMORANDUM—TRANSPORTS—EX-GERMAN.

When these ships were seized by the United States authorities, all records, scraps of paper, etc., found on board were carefully collected and translated. On one ship the following memorandum in German was found: "Commended wrecking engines January 31, 1917." It is to be noted that this is the day before the notice by Germany that she would on February 1, 1917, resume unrestricted submarine warfare.

It is to be noted that the principal parts of the machinery that were attacked were the main engines and that the broken parts were practically all of cast iron. The intentions of the Germans were evidently to keep these vessels out of service for from 12 to 18 months, believing that every broken cylinder, etc., would require renewal before the vessels could again operate. They evidently didn't know that cast iron could be successfully welded. Their plans were not to completely wreck the ships, but to damage the machinery to such an extent that they could not be placed in service for from 12 to 18 months, believing that new cylinders, etc., would have to be installed. I have reliable information to the effect that arrangements had been made in Germany to manufacture new ones, and have them ready for installation at the end of the war, which was planned to win in from 6 to 8 months by means

of their unrestricted submarine warfare. They were confident that England would be isolated and starved out by that time.

Submarine warfare, as practiced by the Germans, had, it must be admitted, greatly reduced shipping on the sea, and if the war were to be carried on to a successful conclusion, ships had to be immediately placed in service to supply the allied armies with their enormous necessities and also to transport our own Army and its vast equipment and supplies to the front. Hence, the vital necessity of getting these ex-German and ex-Austrian vessels into service at the earliest possible moment.

The vessels taken over by the United States, as stated above, were 104 German and 8 Austrian. In addition to these 112 vessels, 4 were obtained from Cuba, that country having declared war on Germany. Cuba had no facilities for repairing these vessels and they were consequently given to the United States. In order that you may realize what these vessels meant to the United States I will state that they aggregated 635,656 gross tons.

Upon the seizure of the vessels by the United States customs' officials, they were turned over to the United States Shipping Board, which board had, as you know, been organized for the purpose of handling all new merchant shipping under the United States flag.

The Shipping Board, after thorough inspections of the vessels, decided that all broken parts should be renewed, which, by the way, was in accord with the usual commercial practices and also with the requirements laid down by marine underwriters.

Considering the number of the ships and the vast quantity of damaged machinery, together with the fact that all plans, drawings, and records had been destroyed, it can be readily seen what an undertaking this would have been and the time it would have taken, especially at a period when the world was calling for more shipping, and the Allies were calling for men and supplies.

In this connection, attention must be invited to the fact that our Atlantic coast navy yards and private shipyards were already congested with work on vessels to meet the deficiencies caused by submarine warfare, and the building of destroyers for use in driving the German submarine off the sea.

The Navy Department speedily realizing that the larger ex-German passenger ships must be one of our chief factors in placing our Army on French soil, their quick repair became a matter of the greatest national, or I might say, international interest.

It was decided that the time required to build new machinery was prohibitive, and as the Navy was not bound by previous practices, nor by the rules and regulations laid down by marine underwriters, these larger passenger ships were turned over to the Navy for repair and operation.

The Bureau of Steam Engineering, Navy Department, after a thorough investigation of the subject, decided that it was not necessary to build new machinery and directed that broken parts be repaired by electric welding, patching, etc., thereby saving time, which was the vital factor, and at the same time avoiding congestion of foundry and machine work, as would be necessary with new castings, in the navy yards and private plants.

This decision, so far-reaching in its application and so fraught with danger to the professional reputations of the persons directly concerned in carrying out this work, was made in the face of opposition by engine builders and marine underwriters, but with such confidence in the ultimate result as left no room for doubt of its success.

In order to show what importance the Secretary of the Navy attached to this work, I will quote from his annual report for the fiscal year 1918.

I have entered upon so full a statement of this case because I think it stands out as one of the greatest engineering achievements of the period. The perpetrators of this sabotage were confident that they had damaged the machinery of ships beyond repair, which fact is evidenced by a memorandum, in which each case is carefully noted, followed by the significant remark "Can not be repaired," and the speedy rehabilitation is a splendid triumph of American ingenuity and an evidence of American engineering accomplishment that is deserving of the highest commendation. The restoration of these magnificent ships to service reflects the greatest credit upon the naval officers concerned and upon the officers and employees of the welding and engineering companies who carried out the work. It is an illustration of the part played in winning the war by the men who handled the electric torch or who fashioned and secured mechanical patches to these damaged cylinders. Without these ships, we could not have transported our troops to France as rapidly as was done.

JANUARY 8, 1918.

Repairs, alterations, and fitting out of German vessels—Repairs and alterations.

| German name. | Renamed. | Hull. | Machinery. | Total. |

Complete data of all of the German and Austrian vessels taken over by the United States is on file in the Navy Department.

Admiral McKEAN. It will be noted that two of these ships were sunk on the return trip. The attached memorandum from the Bureau of Steam Engineering covers more or less the details of cost, etc., of conversion of those ships and their adaptation to troop transport work.

(Thereupon at 12.45 o'clock p. m., the subcommittee adjourned until to-morrow, Thursday, April 29, 1920, at 10 o'clock a. m.)
